THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTERED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 23. SUSSEX, NEW BRUNSWICK, OCTOBER 10, 1916. Number 1.

The Charlottetown Exhibition

The twenty-fourth annual exhibition, held under the auspices of the Charlottetown Driving Park and Provincial Exhibition Association, was opened to the public on September 26th, 27th, 28th and 29th.

Tuesday, the opening day, was windy and cold, a weather condition not at all conducive to a large attendance. The weather on the other days was, however, all that could be desired, and all incoming trains and steamboats were crowded with excursionists en route to the big show. Long lines of horses and carriages dotted the roads leading to the city. No fewer than three hundred and twenty-five teams entered the city by one approach, the Hillsboro Bridge, which is one of the many highways leading to Charlottetown from prosperous outlying districts.

The exceptionally fine weather that prevailed this fall hastened the harvesting operations, and, unlike last fall, the grain was nearly all garnered and farmers and their families could well afford to take a well earned holiday. The turnstiles registered an aggregate of sixteen thousand admissions on the second and third days of the exhibition. These records outclass in numbers those of any other two days at any previous Charlottetown fair.

What meant the eager, joyous throngs? The answer is: Frank R. Heartz, president; C. R. Smallwood, secretary, and the other commissioners who have the welfare of the association in their keeping had been busy during the past year, making arrangements to stage in 1916 a record-breaking exhibition of the products of the island province.

To accomplish this result a big sum of money was needed. The Dominion Department of Arigculture gave a grant of $2,500. The Government of Prince Edward Island gave a grant of $5,000, and the City of Charlottetown, as usual, set aside a grant of $500. This tidy aggregate of $8,000 enabled the management to offer a specially tempting prize list. The response on the part of the Prince Edward Island agriculturists and live stock breeders was most creditable in all departments.

Although the exhibition was for the fourth time open to all Canada, the number of exhibitors who brought stock from the mainland was comparatively small. The difficulty of transferring livestock from train to steamer and vice versa is undoubtedly responsible for the small number of exhibits from the mainland. This difficulty will shortly be overcome by the completion of the docks at Tormentine and Traverse Capes, when the good ship "Prince Edward Island," will convey the cars of freight without transfer across the Northumberland Strait and the hard work of unloading and reloading en route will no longer be necessary. Then the mainland boys will go after the tempting prizes hung out at Charlottetown. But to go after them and to win them are two different propositions. The island breeders are improving in all classes of live stock and are looking well to their laurels. They are not satisfied to rest on their oars and take anybody's dust. Every time a little advance toward the ideal seems to be the motto of many of the island breeders. In other lines the Garden of the Gulf produces the very best grains, vegetables and roots, and is fast becoming the Denmark of America in dairy products, bacon production, egg production and in the development of community spirit and co-operation.

The Maritime Farmer has sent one or more of the members of its staff every year since its inception over twenty years ago to take stock of the agricultural progress of the island province as evidenced by the quantity and quality of the exhibits at the Provincial Exhibition. The Maritime Farmer is the only journal or medium of any kind that publishes a complete list of the prize winners in the sections of most importance to the live stock breeders and the growers of first-class seeds.

Thousands of dollars have been steered to the pockets of island breeders and seed growers by the publicity given to the prize winners through the columns of The Martime Farmer. When we receive requests for copies of The Martime Farmer containing a list of the prize winners at Charlottetown, and these requests are very, very frequent, we know that some mainlanders, and islanders, too, wish to patronize the growers of the best live stock and seeds in the Island Province. In passing, we wish to say to the breeders and seed growers of Prince Edward Island that the best and surest way for them to dispose of their surplus stock is to advertise in the columns of The Maritime Farmer. If any island reader has any doubt on this matter we will be perfectly satisfied if they abide by the verdict they will receive from any of the island breeders who have ever patronized our columns. Ask them!

Reverting to exhibition matters again, it may not be amiss to give the following comparative numbers of entries:

	1915	1916
Horses	275	289
Cattle	390	458
Sheep	287	290
Swine	190	251
Poultry	450	614
Grains and seeds	85	111
Roots and vegetables	425	583
Fruit	390	458
Plants and flowers	285	232
Dairy products	77	81
Fancy work	288	440
Art work	130	304
Woolen goods	127	140
School work	39	28
Miscellaneous	201	322
	3,639	4,601

This is the largest in the history of the exhibition, and an increase of 962 over last year, when the fair was also open to all Canada.

While these results are creditable and very encouraging to the management, they are looking for bigger and better things, for there is a sound abroad in the island, a rattling among the dry bones, so to speak, as evidenced by the following remarks by President Heartz at the official opening:

"The outlook for future exhibitions is excellent, but we are not at all satisfied with the showing made by the farmers. Of course, I will acknowledge that some few are to be congratulated on what they are doing and on what they have done, but the important fact remains that our exhibition is not up to the standard that it should be. We have endeavored to foster and increase certain classes by giving large prizes, but without much appreciable result. We wish to see more competition. You may not realize it, but it is far better to be third in a class of twelve than first in a class of only three exhibits. I have no doubt that many farmers come here as spectators who, when they see the prize articles or animals in the different classes, know that they have much superior articles or live stock at home, but they have been afraid or too dilatory to exhibit them. This, in a way, is a species of unpatriotism to your native province. The Dominion Government have established here an experimental farm, which, under the excellent management of Mr. Clark, has become second to none in Canada. The local government are now reviving the old stock farm and putting it on a proper and up-to-date basis, short courses are being held, lecturers cover the country, the Exhibition Association, with the assistance of both Federal and local governments, has been endeavoring to interest you from a financial standpoint, and notwithstanding all this the great majority of our agriculturists appear indifferent, and do not display the interest that they should in our provincial and county exhibitions. If we are to carry out the fundamental principal of this or any exhibition it is essential that we should have more exhibits, more exhibitions and much more competition."

We feel satisfied that the Association's desire for more exhibits, more exhibitors, and more competition, will shortly be realized. The desire is justly in accordance with the progress that is now rife in the Garden of the Gulf.

The most progressive business men of Charlottetown had well arranged displays of their goods at the fair. Their tastefully decorated booths blended nicely with the long lines of tables laden with the products of the orchard, the field, the garden, and the dairy.

The display by the Provincial Experimental Station was one of the indoor features. Special attention was given this year to the sheep industry, and an interesting collection of models of houses, racks, hurdles, etc., were shown. The treatmen of diseased plants and vegetables was also illustrated. The infected product was shown and alongside of it the formula for the cure. Various placards giving results of tests were also displayed. This included the oats tests made in Kings County. They showed that Banner leads with 62 bushels, 27 pounds to the acre, Ligowo second, and Old Island Black third.

Several hives of live bees, all "busy as bees"; models of barns and poultry houses, stacks of leaflets for free distribution were included in this splendid exhibit, which was in charge of Superintendent Clark and his assistants. These gentlemen were ready and willing to answer all questions about their exhibits and the scope of their work on the farm.

Dominion Egg Exhibit

The egg exhibit of the Live Stock Branch, Ottawa, was another instructive feature on the main floor. It was under the supervision of Mr. Kerr, of the Poultry Department, and was in charge of Mr. E. Rhoades. During the fair there was a candling demonstration in order that the city people might learn how to distinguish between good and bad eggs. A good sized candling booth was a part of the exhibit. The producer was shown also how to grade his eggs according to standards. There were specimens of eggs, cartons, candling appliances, etc. The last named appliances for lamps and electric lights will be mailed free from Ottawa on application. In this exhibit 203 dozen eggs entered in competition were classed as specials, extras, and No. 1's. This exceeds by 50 dozen the number shown at the Halifax Exhibition. The value of the egg crop was compared with fruit, vegetables, and barley was also represented by piles of money. The value of eggs in Canada last year being over $23,000,000, vegetables was over $20,200,000, fruit about $13,000,000, and barley $14,000,000.

The Egg Circle movement is rapidly gaining ground and accomplishing results in Prince Edward Island. We made special editorial mention of their work in our September 12th number.

Another movement that is rapidly gaining ground in Prince Edward Island is the co-operative sale of wool.

To help along this line of work in Canada the Live Stock Branch of the Dominion Department of Agriculture made exhibits at the fall fairs and

396395

Charlottetown was rightfully entitled to a place in the itinerary.

The exhibit was incharge of Messrs. G. E. O'Brien, C. Stetson, G. M. McCrimmon, and T. W. Sexsmith, who were on hand to answer all questions and help boost the sheep raising industry.

The object was to explain fully the various classifications and grades, and to show how wool may be handled in such a way as to secure the best advantages to both the producer and buyer. In order to command the highest market prices wools should be presented in a carefully folded and packed condition, and should contain as little foreign matter as possible. The graded product is also more acceptable to the trade than where all qualities are mixed together.

One of the most interesting and instructive features comprised samples of wool in both the greasy and scoured condition, showing the injurious effects of using insoluble paints, which are difficult to remove, rather than the standard dipping fluids for marking purposes. This case also contained samples of wool that had been tied with binder twine showing how the sisal fibre becomes incorporated into the wool and the consequent defect this produces in the finished product. The injurious effects of shearing wool while damp or permitting it to become damp while in storage are shown, together with the damage caused by the incorporation of straw and chaff into the fleece.

In the display were shown most of the important classes of Australian, New eZaland, South American and South African wools. Of foreign and domestic wools used in Canadian manufacture there was a very complete collection. Two large cases contain representative fleeces of the most important breeds of Canadian sheep, and smaller samples of each were shown to distinguish their character and staple. This is supplemented by a most comprehensive display of English wools covering virtually every grade in that country. In these cases beginners were given an opportunity to compare the wool of the different breeds, and thus become acquainted with the average weight of fleece and quality of wool obtained from each.

Comparison was also made of the British, American and Canadian methods of classification, but especial emphasis was placed on the domestic product. One large case contained fleeces of Canadian wool representing the different classes as they are graded for the market.

The process of woolen and worsted manufacture was illustrated by samples representing the intermediate products from the wool in the grease to the finished cloth. This served to give the public an idea of the types of wool entering into the different classes of fabrics. Although the living specimens were not shown, a number of enlarged photographs of representatives of the different breeds, as well as entire flocks, were included in the exhibit.

There was a good display of grains, roots, and vegetables. Mr. J. A. Clark placed the awards.

The fruit show, though small, was creditable, well grown, well colored, and quite free from evidences of fungus and insect depredations. H. A. D'Almaine placed the awards.

The cheese and butter exhibits were the best ever shown at Charlottetown, and indicated that the special efforts put forth during the season to improve the quality of the output met with success. Prof. Reek, who is in charge of the agricultural development work in Prince Edward Island, informs us that the majority of the factories have made many improvements in and around their premises besides a great deal of missionary work among their patrons, all with a view to enhance the quality of the finished product. George Barr, chief of the Dairy Division, scored the various exhibits, and was assisted by Messrs. Morrow and Mitchell, who are doing such good work in promoting the island's dairy industry. The arrangement, the quality, and number of exhibits, strikingly evidenced what Prince Edward Island and its people can accomplish in this most important industry.

Speaking of the cheese exhibit, Mr. Barr said:

"In apeparance the cheese are better finished than last year. They are better made, the texture is closer, but the flavor, he regretted to say, was not so fine as it should be. The defects in flavor and texture would be due to insufficient cooking or leaving too much moisture in the curds at dipping. There is an increase in the number of entries. The show, on the whole, is creditable, but there is still room for improvement in the finish and quality of the cheese."

Entries in the cheese classes are open to Prince Edward Island factories only, and must be made through the secretary of the Island Dairy Association under the following conditions:

All chese for exhibition will be held in the custody of the Prince Edward Island Dairy Association, and one box of cheese, either large, twins or a flat, from the make of June, July, August and September will be required.

The Dairy Association will take charge of, store and insure all cheese for exhibition and all exhibits will be sold at the first meeting of the Cheese Board after the exhibition.

A representative of the Dairy Association will set aside when passing through Charlottetown one box of cheese from the last half of each month's make except Setember, which will be taken from the first half.

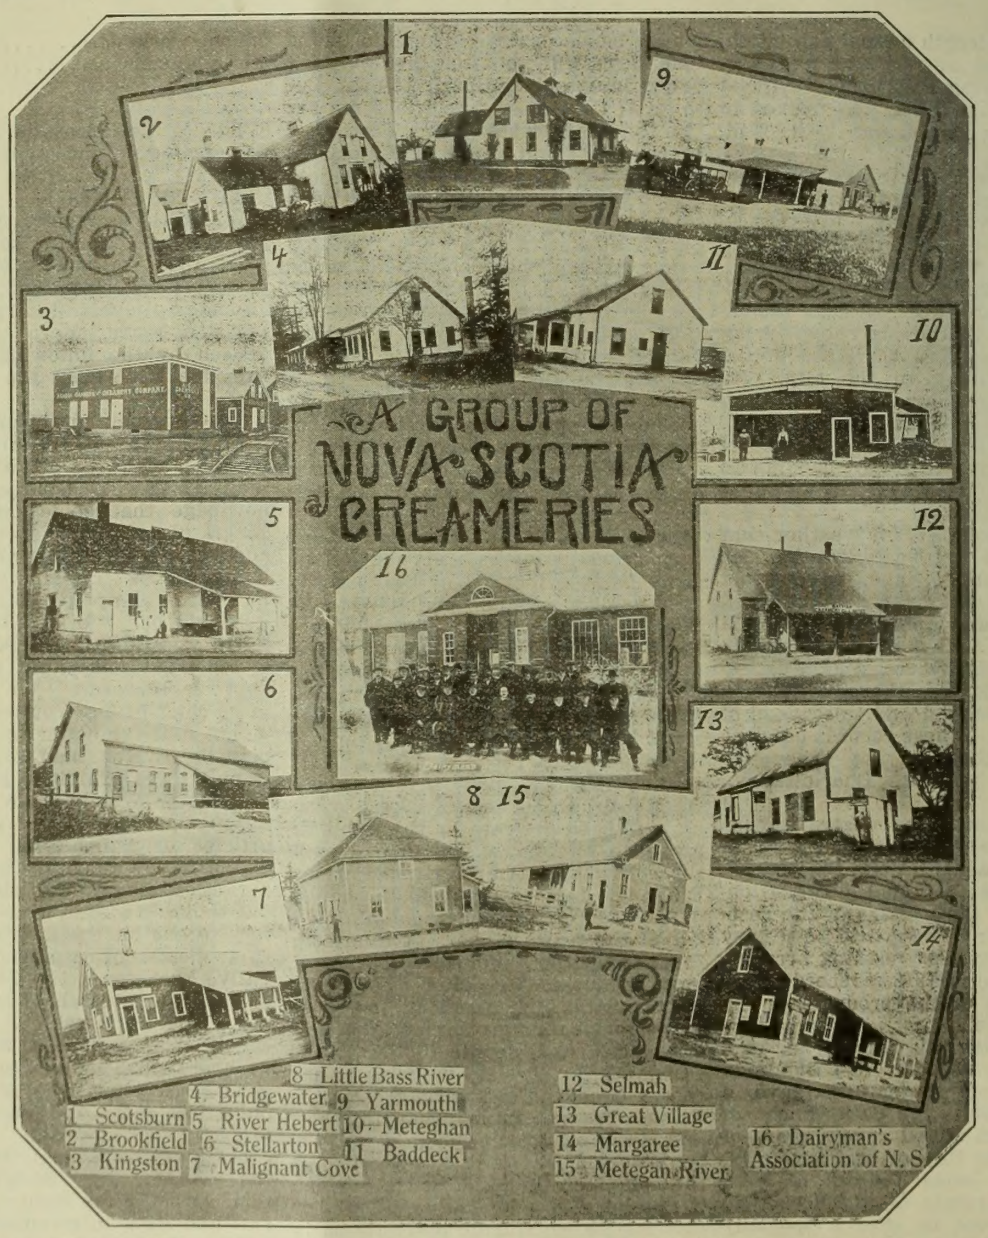
In case a factory enters and the shipments are not passing through Charlottetown each month, by corresponding with the secretary of the Dairy Association, they will receive instructions how to proceed.

In setting these cheese aside, covers will not be removed from the boxes, the idea being to get a representative sample of the factory's output for exhibition, but any box that is marked "Seconds" will not be taken.

The cheese from each month's make will be scored separately and the average of the total score for the four months will be taken as the basis in apportioning the prizes.

The prize money allotted will be awarded pro rata according to points obtained by and over a minimum standard of 92 points.

The cheese will be judged by an independent expert by a scale of points as follows: Flavor, 45; texture, 25; body, 15; color, 10; finish, 5; total, 100.



Following are the scores in the cheese department by the various factories in alphabetical order for a pure of $150 awarded pror ata to all exhibits scoring 92 points or over:

Alberton	93.87
Cornwall (3rd prize)	94.96
Dundas	93.08
Emerald (2nd prize)	95.05
Egmont Bay	92.07
Gowan Brae	93.07
Grand River	93.08
Hillsboro	93.97
Hamilton	93.47
Hazelbrook	94.62
Kinkora	94.15
Kensington	93.3
East River	91.97
Lot 16	93.22
Murray Harbor	No exhibit
New Perth	91.22
New Glasgow	94.12
Orwell	90.6
O'Leary	91.85
Park Carner	93.5
Red Point	94.05
Red House	93.
Souris East	92.47
Summerside	93.98
Stanley Bridge	93.82
Tignish (1st prize and Gold Medal)	95.27
Tyne Valley	91.52
Vernon River	93.35
Wiltshire	91.87

Private dairy cheese—1. R. B. McKinley, North River.

The butter scores in the respective sections were as follows for a purse of $30, divided pro rata to all exhibitors scoring 92 points or over. Box of 56 pounds, suitable for export, made at any creamery:

J. P. Simmons, Durestaffnage	96.8
Ben Gallant, St. Louis	96.1
Heber McQuarrie, Wellington	95.7
Hiram Lane	95.6
Dunk River Creamery	95.5
R. H. Hubley	95.3
Tryon Dairy Co	95.

Box prints, 50 pounds, in regular shipping box as used by creamery, for a purse of $20, divided pro rata to exhibitors scoring 92 points or over:

Tryon Dairy Co (Gold Medal)	97.3
Dunk River Dairy Co	96.1
J. P. Simmons	95.7
Heber McQuarrie	95.1

Tub or crock, 20 pounds, made at private dairy, for a purse of $15, divided pro rata on scores of 90 points and over:

Mrs. Ernest Provose, Blackley Point Road	94.2
Fred Glydon, Margate	93.1
Mrs. John McMillan, Hazelbrook	92.9
Mrs. L. H. D. Foster, Marshfield	92.2
Mrs. William Noy	91.9
Clara E. McMillan	91.8
Mrs. G. H. Hooper	91.3
Maud Carew	91.7

Louise Howard 91.5
Mrs. A. H. Boswell..... 90.7
James Essory ..... 90.
R. B. McKinlay 89.5
George H. Jones..... 89.5

Box of prints, 6 pounds, made at private dairy, for a purse of $7.50, divided pro rata for scores of 90 points and over:

Maud Carew, Hunter River..... 93.2
Mrs. L. H. D. Foster..... 93.
Frank Glydon 92.3
Mrs. W. D. Fraser..... 92.1
Mrs. Calvin Wood ..... 91.
Louise Howard ....., 90.7
Mrs. A. H. Boswell..... 90.5

Butter, fancy display, 2 to 5 pounds, made at private dairy:

First—Heath Vessey.
Second—Miss Edna McDonald, York.
Third—Mrs. Daniel Fraser, North River.

The Horses

The horse show at Charlottetown was a big centre of attraction. Hundreds of interested spectators lined the judging ring and closely followed the decisions of the judges.

Dr. E. Watson, Hudson Heights, Quebec, placed the ribbons in the light horse classes and Mr. Adam Scharfe, Cummings Bridge, Ont., did similar duty in the heavy horse classes.

There were quite a number of entries in the carriage class, but the majority of them would be more in place in the roadster class. Warren Ogilvie's matched pair of hackneys led the way in their class, followed in second place by John Horne's pair by Kalol and Parkside. C. B. Clay showed the champion mare of the class, a two-year-old filly by the thoroughbred stallion Zabingo. A nice yearling filly by Fashioner and a trappy gelding by Island Swell, shown by George Boswall, showed considerable carriage action. The majority of the other entries were of a roadster type, standard bred breeding predominating.

Standard Breds

There was a good showing of standard breds. The aged stallion class brought out such noted sires and prize-winners as Mayor Todd, the Acadian by Sabledom, and Prince Major by Moko. Despite the fact that Mayor Todd has put in a long, hard season in the stud and on the turf, and is not carrying very much surplus flesh, he led his class. The Acadian followed in second place, and Prince Major in third.

D. W. White of ork Point, had the only entry in the three-year-old stallion class, Pat Ola by Dingold.

Alex McKay, of Charlottetown, and Duncan Robertson were the only contestants with two-year-old stallions. The red and the blue were placed in the order named on Moko, Jr., by Prince Marjor and Bottom Brazilian by Bottom.

The three-year-and-over-mare class brought out five good ones. Harriet King by Robert King, Queen Alto by Alphonso, and Capitola H. by Parkside captured the red, the blue, and the white ribbons in their respective order, while further down the line beyond the prize money stod Oak Cap by Oakley Baron, and Dudy Beatrice by Kalol.

The winners of the Hammond Kelly special prizes for the best foals of 1916, sired by Mayor Todd were Miss Clara E. McMillan, Cymbria Lodge; William Aul & Son, Clyde River; George H. Jones, Brackley Point Road, and Stewart McEachern, Mt. Stewart, with a quartet of beauties.

Saddle Horses

There were five entries in the class for saddle horses ridden by gentlemen, and four entries were in the class ridden by ladies. One of Warren Ogilvie's hackneys led the former class, and the first and second prize winners in the latter class were by Hernando and razilian.

Roadsters

The roadster classes, although not boasting a great deal of quantity, had quality to burn. There were five entries in the aged class. The three-year-old class brought out only two entries, one by Darkwood, the second by Commodore Ledyard.

There were only two entries in the section for brood mares. The first prize winner was by Parkside, and the other by Cresceus. Their foals were by British Soldier. A Kalol mare led the class for mare or gelding shown in carriage.

Ponies

There were only three ponies on the grounds.

Shires

The shire breed had only one representative, the aged stallion Eskham Waggoner.

Percherons

With the exception of the first prize aged stallion Georg's, shown by David Reid, Montague, A. R. McKay, of Charlottetown, owned all the Percherons shown in the ring. The aged stallion Kassott, two good three-year-old mares, a brood mare with foal at foot, a two-year-old filly and a one-year-old filly.

General Purpose Horses

The aged section of this class brought out eight entries. The three-year-old section had five entries—A andit, a Crown Rights and a Fashioner captured the money in their respective order. One brood mare with foal and one matched team were the other entries in this useful class.

Walking Horses

Byrne Bros. aged mare by aPrkside captured first money in the class for light horses, and Horne Bros., A. A. McBeatte and Pope Noy captured the dough with fast walking drafters.

Clydesdales

Now we come to the big feature of the horse show, the feature in which the farmers were most interested—the Clydesdales and the heavy draft horses, the majority of the latter being the get of pure bred Clydesdale stallions.

The aged stallion section was graced with six entries. The never beaten Baron Kelvin by Baron's Pride, Thorndale by High Honor, Wood End Chief by Up-to-Time, Royal Darnley by Bergie Royal, Black Band Sensation by Black Band and Lord Dalmaney, Jr. ,by Lord Dalmaney. The first mentioned stallions captured first, second and third monies in the order named. Baron Kelvin captured the championship diploma and first prize offered by the Clydesdale Association for the best imported stallion, Thorndale captured the second prize in the latter section.

Baron Rossiter by Baron Kelvin, Mock Kippock by Kippoch Prince, and Pan Baron by Baron Kelvin put up a three-cornered contest in the three-year-old stallion class, and were placed in the order mentioned. Baron Rossiter was later awarded the gold medal for best Canadian bred stallion. There was also a three-cornered contest in the two-year-old stallion section, and when Mr. Scarfe had made his decision the prize winners in the order named were: Dean of St. Cuthberts, Clyde Prince and Prince Evan, all by Keppoch Prince.

Sons of Baron Mac, Baron Kelvin and Bandit were the only three contestants in the one-year-old stallion class, and won the red, the blue and the white in the above mentioned order.

E. Heartz had the only three-year-old filly in the Clydesdale class, a beautiful mare by Atlas.

Two-year-old fillies were two in number—a Keppoch Prince filly led the way, followed in second place by an Atlas filly.

In a three-cornered contest in the Prince fillies sandwiched a Baron Kelvin filly. The first prize winner in this class was Haidi of Sure Acres out of a Crown Rights dam shown by W. W. Crosby, Cornwall, who with her captured the diploma for best mare any age and the Clydesdale Association gold medal for best Canadian bred filly.

There were seven foals of 1916 and six brood mares with foal at foot. The dam of one of the foals shown, a Keppoch Prince mare, died when the foal was quite young and he was reared by a very ordinary looking light mare, but the little orphan by Baron Kelvin led his class. A Baron Kelvin foal out of a King's Fortune dam came in for second money, and a Lord Darnley foal out of a Moncreif Marquis dam captured the third money, while further down the line stood three Thorndale and one Keppoch Prince foals. The mares with foals at foot were awarded prizes from the lower end of the list. The grey Maximilla by Hiawatha Gudolphin with her foal by Keppoch Prince, a Baron Russel mare and Lady Weaver, both with Thorndale foals at foot, captured second and third monies. Maximilla won the Clydesdale Association prize for best imported Clydesdale mare.

R. P. McKinlay's Lord Darnley was the only stallion shown with two of his get.

The Clydesdale Association special prize for the best mare or gelding sired by a registered Clydesdale stallion was awarded to E. Heartz on a mare by Reformer.

A pair, one a Reformer and the other a Prince Prime, also shown by E. Heartz, captured a similar special for pairs, the second prize going to Horne Bros. on a beautiful pair by Crown Rrights. The other contestants for the honors was a Crown Rights and a Lord Darnley, shown by D. C. McKinlay.

Heavy Draught Horses

The heavy draugt horses made a splendid showing. In the three-year-ol dclass there were five fillies. The first prize winner was by Keppoch Prince. The second an dthird prizes went to Baron Kelvin fillies, Hercules and Brown Mac were the sires of the other two.

Two-year-old fillies were five in number. In this class also a Keppoch Prince filly led the way an Eskham Waggoner came in for second money, a Lord Darnley for third, and there being only three prizes a Bandit and an Atlas did not win anything for their owners.

Baron Kelvin, Bandit and Lord Darnley were the sires in the order named of the prize winners in the yearling filly class.

The section for mares with foal at foot had three entries and the awards, as was also the case with foals of 1916 were: First a McQueen mare with Bandit foal and two Crown Rights mares; the second prize mare with a Royal Darnley foal and the third prize mare with Baron Kelvin foal.

There was only one matched team, 1400 pounds and over, a Crown Rrights and an Eskham Waggoner, shown by D. C. McKinlay.

The class for mares or geldings, 1400 pounds and over, brought out five good ones. The first and second prizes went to a full brother and sister out of a Rockaby dam and sired by McLean's Barrister, shown by G. H. Simmons. Pope Noy had the third prize winner, a Sir Donald. The other two entries were by Crown Rights.

The Hon. John Richards special prizes for 1916 foals by Baron Kelvin went to foals out of Keppoch Prince and Crown Rights mares, the first prize winner being the orphan referred to in a former paragarph.

Beef Cattle

The beef cattle were judged by L. O. Clifford, Oshawa, Ont. Mr. Clifford is one of the most successful breeders of Hereford cattle in Canada. At all the leading Western shows he has captured the choicest awards during the past seven or eight years.

Shorthorns made the best showing that ha sever been put on at Charlottetown. A. N. Griffin was over from New Minas, N. S., with a choice herd to vie with J. M. Laird & Son, Theodore Rose, Francis Chown, W. B. Travisdale, Harry Tweedy, Boyd Livingstone, S. C. Lane, Hugh McPhee, H. Mason, Ray Clark and Wallace Stead, who all brought their stock out in a very creditable condition. Laird & Sons' aged bull, Stately Monarch, was first in his class and carried off the male championship and was first with three of his get. Laird's two-year-old heifer Elmdale Rosedrop captured the female championship. The Lairds also captured the first prize in aged herd. rGiffin showed the second prize aged herd and the first prize breeder's young herd.

Herefords

Herefords were shown by William O'Brien and Sons, Windsor Forks, N. S., and G. L. Hayden, Cherry Valley, P. E. I. The big majority of the choicest awards were captured by the O'Brien herd. Hayden led the way with tw-oyear-old bull, two-year-old heifer and senior heifer calf. O'Brien's aged bull, Princeps 33rd and their junior heifer calf Stella were the male and female champions of the class.

Aberdeen Angus

With the exception of second prize on yearling heifer which went to Joseph Praught, Cherry Valley, all prizes in the Aberdeen Angus class went to Horne Bros.' smooth, evenly finished herd.

Beef Grades

There was a nice showing of beef grades. See the list of awards on another page.

Dairy Cattle

There was a big showing of dairy cattle, all of which, with the exception of a few Jerseys shown by T. C. Latham of Sylvester, N. S., were from island herds. Pure breds are rapidly increasing in numbers in the island province, and it is most gratifying to note the enthusiasm that exists among the young breeders who are just beginning to take up the work. F. R. Mallory, Frankford, Ont., placed the awards.

Ayrshires

It is needless to say that there was a good showing of Ayrshires when it is known that A. McRae & Sons had their stock in the ring. Both in the show ring and in the dairy tests the McRae's have been doing excellent work with their Ayrshires. The other breeders who showed Ayrshires were: H. A. Robertson, Henry Brennick, A. E. Ings, Pope Noy, Robert Stewart, John Barr, W. F. Yonker, Calvin Wood and Bert Brown. Mr. Brown is breeding a big, useful type of Ayrshire with well placed, large teats. One of the cows in his herd, Anne II, now aged 17 years and 9 months, has since October, 1912, dropped four calves, two of which were prize winners this year, and has given 33,700 pounds of milk, testing 4.4 per cent. butter fat, yielding 1,482 pounds of butter.

McRae's junior bul calf, Lochinvar Champion out of White Rose by Netherton Lochinvar, was the male champion, and their Nellie of Spring Brook Farm came in for similar honors in the female section.

The best four animals get of one sire were by Hobslands Thumphie's heir McRae's aged bull.

The two best animals' progeny of one cow were shown by John arr.

Jerseys

The battle royal in Jerseys was waged between the herds of William Clark & Sons, Wallace Stead, A. R. McKay, Frank Glydon & Son and T. C. Latham, all of which contained individuals of merit. The owners of these herds are not faddists and their herds show that they are money makers. Frank Glydon & Sons' yearling bull, Figgis Fern Lad was the champion male, and Clark & Sons' first prize

aged cow, Lassie of Maple Grove, was good enough to snatch the female championship from all comers. Messrs. Clark and Stead had the first and second prize aged herds, respectively, and the Glydons captured the first prize in breedrs' young herd.

Guernseys

The main showing in the Guernsey class was made by Roper Bros. and Frank H. Roper. Roper Bros. two-year-old Helen's Prince was the male champion, and Frank H. Roper's Maidie of Eastview, the first prize aged cow won the female championship. Both herds made a good showing.

Holstein's

Competition was not lacking in the Holstein classes. W. McLeod, the island's most prominent Holstein breeder, was there with a string of good quality. W. J. Gibson is also building up a good herd and captured some of the prizes. Godfrey Bros., John Twedy, A. Roy Jnoes, J. Walter Jones also helped to keep matters moving in this class.

The Lea herd captured the choicest awards throughout the class, and in the Association Specials sections. The champion female was Island Aggie De al, first prize cow in the aged class. The best two animals' progeny of one cow were out of Aggie Daisy Dr. Kol. The majority of Lea's young stock were by Ida Rooker II Vale. Tweedy had the best yearling heifer. Godfrey ros. showed the best yearling bull. Gibson captured first and third monies on two-year-old heifers and a first on ujnior calf. The herd prizes went to Lea.

There was a big showing of dairy grades. See the full list of awards on another page.

Sheep

All that need be said about the sheep classes is that the most popular breeds were well represented and when we say that the respective breeds were in the hands of the island's best shepherds it is needless to remark that there were very few weaklings or off type individuals in the aggregation that nearly totalled three kundred head. C. D Bain., Oshawa, Ont., placed the awards.

Swine

Mr. Bain also judged the swine classes, and a busy time he had. Yorkshires, Berkshires, Tamworths and White Chesters and their grades and crosses made up as good a showing of pigs as one would find anywhere in Canada. About 260 head, all ages, were penned at the fair. Several of the hogs entered in the bacon for export class were overweight but of splendid type.

A. A. McBeath, Marshfield, showed a monster Yorkshire boar, the largest we have ever seen at any of our Maritime fairs.

T. C. Latham, Sylvester, N. S., judged the poultry classes. White Leghorns in young and old led the entry list. There were some excellent specimens of Orpingtons, Minorcas, White Wyandottes and Rhode Island Reds.

The ducks, geese and turkeys were an excellent lot.

PRIZE WINNERS AT CHARLOTTETOWN

HORSES

Carriage Horses

Filly, 3 years old—1, E. Heartz, Marshfield; 2, W. M. Lea, Victoria; 3, Walter Rodd, Harrington.

Filly, 2 years old—1, C. B. Clay, Bridgetown; 2, Wm. Auld & Son, Clyde River; 3, J. S. Wedlock, Charlottetown.

Filly, 1 year old—1, Geo. Boswell, French Fort; 2, S. A. Knight, Georgetown; 3 ,J. H .Judson, Alexander.

Heifer calf, under 1 year and over 6 months—1 and 2, W. M. Lea.

"WHY are your cookies creations of charm?"
Said the young lover to Mary;
(Dimples were seen on her plump little arm,
Pretty and sweet as a fairy!)
This she responded, her utterance clear,
"Purity Flour is the cause of it, dear."

PURITY FLOUR

MORE BREAD AND BETTER BREAD

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from pain in the head, back, bowels, feeling of weight and dragging down sensations, **falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all.—**young or old.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, **mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day**, as you may not see this offer again. Address:

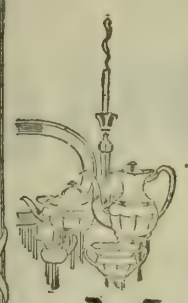
For the Table

Deep down in her heart, every woman longs for a beautiful Service of Silver for her dining room. It may be "solid"—it may be rich plate—it may be ornate or chaste, elaborate or plain. But, whatever the degree of fineness or design, it must be complete, down to the smallest piece.



If the time has come when you can have your Silver Service, we shall be pleased to send you our newest Catalogues showing all the beautiful patterns and designs in Sterling Silver and Silver Plate made by the largest manufacturing Silversmiths in the British Empire.

Many people purchase their Silver Services gradually, adding to them from one of our many stock patterns which are always standard. Send us your name and address for all our new catalogues as they are issued.

EFFECT OF SPRAYING POTATOES

The advantage derived from spraying the growing potato crop is so well established that it does not require further demonstration. There are, however, some points in connection with the operation upon which precise information is useful. For instance, is it better to spray more than once, and if not, should the single spraying be early or late?

The following experiment, which was conducted by the experts of an agrticultural college, throws light on these points:

24 lb. of sulphate of copper
30 lb. of pure washing soda
120 gallons of water

per acre, and four plots were arranged ta each of the different centres.

Plot 2.....Unsprayed.
Plot 2.....Sprayed once, early.
Plot 3.....Sprayed twice.
Plot 4.....Sprayed once, late.

The early sprayings were all performed between July 6 and 16, and the late sprayings between July 21 and 29.

The result proved that the spraying was attended with success in all cases; both the single sprayings produced a large increase in the yield, but twice spraying was decidedly the best, as shown by the following table:

In round figures, the average weight of potatoes per acre was—

	Marketable. Tons.	Small. Tons.	Diseased. Tons.
Unsprayed	8	1	½
Sprayed once, early	9½	1	½
Sprayed twice	10¼	¾	½
Sprayed once, late	9	1	½

Owing to the increased vigour imparted to the plants by spraying the growing period was in the quantity of marketable potatoes almost lengthened, with the result that a great increase invariably follows.

As regards disease, it cannot be said that the spraying did much more than check it, for there was usually not very much difference between the weights of diseased potatoes on the sprayed and unsprayed plots, and frequently it is only by taking into consideration the total weights on the different plots that the proportion of diseased potatoes can be shown to be reduced by spraying.

SAN JOSE SCALE

Experiments with ripe apples infested with San Jose Scale have been going on for several years in the University of Illinois, and the report of the work contained in Bulletin No. 180 presents a few suggestions that will be of interest to fruitgrowers. The summary with which the Bulletin closes states that the insects may live and reproduce freely on fruits plucked from the tree and kept at ordinary room temperatures, and that living young may continue to be born under such conditions during a period of eight weeks.

Infested apples taken from cold storage in December gave similar results, young being produced on the apples for 25 days.

Breeding experiments were carefully conducted at the station, the object being to ascertain the rate at which the insects will multiply. On the data so obtained it was computed that under thoroughly favorable conditions one scale could in a year multiply to over 32 millions.

Spraying with various preparations of lime and sulphur, and with two brands of miscible oils justify the usual preference for the sulphur solutions, especially because of their more prolonged effect when applied in spring. The solutions made at home were found equally as effective as those made up by recognised manufacturers and available on the market as ready for the addition of water. The experiments also illustrated the great advantage of spraying early—before an orchard becomes heavily infested—and they also furnished evidence that spraying in spring is much more effective than spraying in autumn. Indeed, spring spraying is 20 per cent. better than fall spraying. "The possibility of redeeming and restoring a badly infested orchard and maintaining it in a good condition, with one or two sprayings per year," adds the bulletin, "was well established by these operations."

TO PREVENT CABBAGE BURSTING

Many persons growing their own vegetables have experienced considerable annoyance in having a large number of fine heads of cabbage to burst before the vegetable can be used or marketed.

The bursting is caused by rapid growth, and usually occurs after a warm rain which has followed a dry spell. It is surprising how rapidly the heads will split and push out from the center, which is damaging unless the cabbage is used at once.

To prevent cabbage from bursting, go to each head, and pull it just enough to break a large number of the small rootlets, but not enough to allow the head to fall or lean very much to one side. This will lessen the amount of moisture and food taken into the plant and the development of the head, and consequently the bursting will cease. In most cases the cabbage will remain perfect and uninjured, and can be sold or used before any damage results.

Heads of cabbage about to burst, or even those showing the first split, can be kept for several weeks without damage by simply following the above instructions carefully.—J. T. T.

It seems good to have apple season back with us again. There is no other fruit that can displace them. A farm home is hardly complete without an orchard with quite a range of varieties. When I go into the orchard I like to wander about like a sheep and taste this one and that one. Satisfaction is the return from the home orchard and I get the most out of a variety.

Deep ploughing, subsoiling, and underdraining are excellent precautions against drought. Subsoiling is of no advantage unless assisted by good drainage, and the deep tillage not only carries off the surplus water during wet spells, but supplies moisture during periods of drought by capillary attraction of the soil, as well as allowing the roots of plants to penetrate deeper.

DAIRYING.

MILK PRODUCTION

The following remarks on the observance of cleanliness and correct methods in all matters pertaining to the production of milk may not prove out of place, seeing that milk and its relation to the public health is a question of long standing. While science is to a considerable extent essential in dairying, it is no sort of good unaccompanied by practice. In truth, practice and science must ever go hand in hand to attain a useful end.

The Cow Stables

The best material for the floor of all cow-houses or byres is undoubtedly concrete, as it will admit of easy and efficient washings. The utmost attention should be paid to the system of drainage, which is best provided ni the form of surface drains running into a common channel. Cleanliness in the interior of the cow-house is as much requisite as in the dairy itself and the methods of ventilation must be on approved principles, the windows securing at the same time an abundance of light. Those structures admitting a downward draught on the animals are clearly injurious to the health of the cows, and must be condemned on that score. The best windows are those admitting an upward current of air to circulate round the top of the building, and so replace the bad air without causing dangerous draughts. On a great majority of farms the manure heap is to be found in close proximity to the cow-house, and the undesirable odours from this source can be clearly detected in the byre. There can be no doubt as to the evil influences thus communicated to the milk, and where new buildings are being erected or alterations are being planned, it will be well to bear this in mind. A further source of depreciation in the purity of new milk is to be observed in some situations where the entrance to the barn or yard resembles a miniature bog, the cows having to plunge up to their hocks in thick mud when entering the yard. This can be prevented by making a well-drained entrance with chalk or rubble.

Health of the Herd

It is essential that there should not be a single unhealthy cow in the dairy herd. Apart from the risk devolving upon the consumer who is supplied with milk from cows affected with tuberculosis or other diseases, such animals constitute a great menace to the dairy farmer, the disease with which they are infected being easily communicated to the other members of the herd. Before milking, the cows should have their sides, udders, and teats well cleaned, and the first few squirts from each teat, which are of a very watery nature, and contain an excessive number of bacteria, should be allowed to fall to the ground. Considerable importance has been attached to this latter practice whenever the question of clean milk production has arisen.

Milking

With regard to cleanliness, the milker should be above reproach, both in person and clothing. The hands and nails must receive special attention in this direction, and it is not too much to enforce washing before milking is commenced. A thoroughly clean overall or apron should cover the ordinary clothes when milking, and in no case should anyone be allowed to milk or handle milk who in his or her home surroundings is placed in proximity to any infectious disease. Milking with wet hands or the practice of "wet milking" must be rigorously excluded from every dairy. It is both dirty and dangerous, and is too often the result of habitual method which has not been checked in time. By placing their heads against the cows when milking many milkers introduce impurities in the form of dirt, hair, and dust into the milk pail, and this is, therefore, a practice to be condemned. The cow-house should under no circumstances be cleaned out immediately before milking, neither should hay be served in the manger whilst the milk is being drawn. Dust from hay quickly finds its way into the milk buckets, and carries with it germs which naturally are not conducive to the improvement of the milk.

Utensils

All utensils and pails must receive a thorough scouring before use, for it is very necessary that everything with which milk comes in contact should be kept scrupulously clean, and, with this object in view buckets, cans, and all dairy utensils should be designed without crevices or corners in which dirty milk might be retained after cleansing operations. Milk is much more easily removed from vessels before it has become dried upon the surface; so as soon as they are finished with they should be rinsed out with lukewarm water, even though it is not convenient at the time to finish the washing-up process. After rinsing, they should be subjected to a thorough scrubbing in water which contains a little soda. It is not advisable to use too much of this commodity, as it has a tendency to eat away the tin, and rust will consequently quickly set in. Next rinse out with warm water in order to eliminate all traces of the soda, and then set up in an open place to allow fresh air and sunlight to gain access. The milking stools also should receive a regular boiling or scouring at least once a week.

Cooling the Milk

The milk, as soon as it is drawn from the cow, should be removed to the dairy and cooled, subsequently being kept at a temperature as low as possible. The object of cooling milk is to retard bacterial activity. It does not, of course, actually kill the germs, but it prevents their multiplication. When milk is drawn from the cow it is at a temperature of 100 degrees Fahr., which is the most favourable temperature for bacterial activity: consequently, if the milk is allowed to stand for some time without being cooled, all germ life, including the lactic acid bacteria, which is responsible for sour milk, very quickly increases, doubling and trebling itself in a comparatively short time. It will, therefore, be easily understood how absolutely essential to the preservation of pure milk it is for it to be cooled immediately when drawn.—Agrostis.

MILK AS A STIMULANT

One of the most recent discoveries of the Pasteur Institute of Paris has to do with stimulating qualities of milk. While milk has always been considered an excellent tonic and known to be exceptionally rich in food value, it was not until the Pasteur Institute conducted a number of conclusive experiments, that the stimulus

HALLAM'S GUARANTEED FUR COATS AND SETS

DIRECT FROM TRAPPER TO WEARER

You can save the many middlemen's profits by securing your fur garments from us.

We buy our Raw Furs direct from the Trappers for cash, and are the largest cash buyers of raw furs in Canada, buying direct from the trapper.

These furs are manufactured into stylish fur sets and fur coats at the lowest possible cost, consistent with the best workmanship.

Then we sell them direct to you at the very low catalog prices. We pay all delivery charges.

Every garment is sold under A POSITIVE GUARANTEE OF SATISFACTION TO YOU or your money back.

Our sales for fur sets and fur garments last year exceeded all our expectations and were the largest in the history of the house.

This year we confidently expect still larger sales, since the people realize more and more the bargains they obtain from Hallam.

We have in stock a large and varied assortment of all the articles shown in our FUR STYLE BOOK and can guarantee PROMPT SHIPMENT.

PRIZE CONTEST—$300 in Cash given away free in Hallam's Zoological Contest, 64 Prizes—Write to-day for the 1916-17 edition of

HALLAM'S FUR STYLE BOOK

which gives full particulars of the contest and contains 32 illustrated pages showing beautiful and stylish fur coats and sets, moderately priced.

211—MUSKRAT COAT—Made from select dark skins, well matched, deep shawl collar with cuffs. The graceful flare skirt and stylish lines of the coat combined with the handsome reverse border effect give this garment a very striking appearance made only 45 inches long in sizes of bust 32 to 44. Price delivered to you $62.50.

212—MUSKRAT MUFF to match $10.00.

RAW FURS—We are the largest Cash Buyers of Raw Furs direct from the Trapper in Canada.—Our Raw Fur Quotations sent Free.

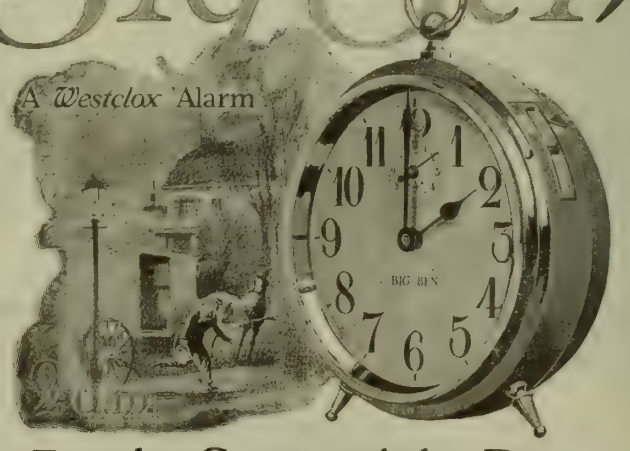
Big Ben



For the Cream of the Day

TWO A. M.—inky dark—that's when Big Ben starts the milkman's day.

Out of bed like a boy going fishing—nudges Big Ben to a hush—takes up the tune as he whistles to work.

You've heard that patter of nimble feet—the clink of bottles in the wire tray—the rattle of boxes, of cans and ice—the giddap—the wheels—the merry tune—all unmindful of the world at sleep. You've wondered.

Try Big Ben *yourself* a little earlier. See how he'll bring *you* the cream of the day—rich morning hours that start you right and stretch out till night with minutes aplenty for every task. And *you'll* take up his tune and smile through the day.

Big Ben is six times factory tested. At your dealer's, $2.50 in the States, $3.00 in Canada. Sent prepaid on receipt of price if your dealer doesn't stock him.

Westclox folk build more than three million alarms a year—and build them well. All wheels are assembled by a special process—patented, of course. Result—accuracy, less friction, long life.

La Salle, Ill., U. S. A. Western Clock Co. Makers of *Westclox*

Other Westclox: Pocket Ben, Baby Ben, America, Bingo, Sleep-Meter, Lookout, Ironclad.

in milk became a known quantity. For a number of months milk has been given the French soldiers in the trenches and to many of them it has been the one and only stimulant. The effect which the milk has produced has more than justified the claims which the Institute made for it.

It is claimed that the stimulating effect of milk is especially notable when given to soldiers just before a big battle or a dangerous charge, and also when administered to the troops when in great fatigue. The advantage of the milk stimulus over the alcohol stimulus so extensively advocated in previous years is that there is no bad after effects, and the keenness of the senses is in no wise impaired nor the coolness of judgment affected.

The knowledge that milk is a stimulant of no mean force will come as something of a shock to those who have hitherto considered it synonymous with all things mild and peaceful. It is somewhat difficult to believe that the chief product of the patient and gentle cow should contain such an element of forceful stimulation. But, as proof of the contention we have the word of the world's greatest research institutes backed up by conclusive experiments in a place where stimulation of the most efficient sort is needed.

BULL'S PREPOTENT VALUE

Can a bull be worth nearly $3,000 in one year in a dairy herd?

It has recently been shown by some records of the Ohio Experiment Station dairy herd that one bull produced daughters average 153 pounds more butter fat annually than their dams. If ten of these daughters produced milk for six years, the total production of this sire would be worth $2,750 more than that of a bull that produced no increase, if butter fat is worth thirty cents a pound.

Since the value of the bull can be determined only by the milk and butter yields of his daughters, it is not a good plan to sell the dairy sire until his daughters have been tested. Buyers should not discriminate against an old bull if he has some high producing daughters, for his value cannot be determined until he is at least four years old—Kansas Farmer.

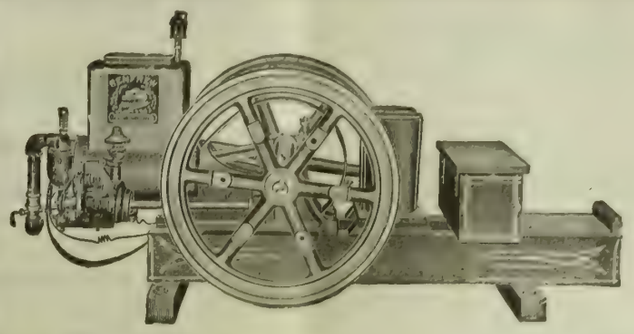
SHELTER AND COMFORT

The colder the weather the greater will be the requirement for food to make up for the lack of shelter provided. The dairy cow is more susceptible to the lack of shelter than either the cow being maintained through the winter or the fattening steer, on account of the small amount of flesh she carries, and the large quantity of water she must consume because of her milk production. There are no exact figures showing just what the loss would be from the lack of shelter, but it is safe to say that it would be great, depending upon the severity of the weather and the amount of milk produced by the cow in the beginning. It would be impossible to maintain a cow at a high level of milk production without giving her protection from the weather.

CREAM TEST AND BUTTER FAT

How much is the test of cream that gives five pounds of butter, unsalted, from a gallon?

A gallon of cream will weigh approximately eight pounds while a pound of butter will contain about 80 per cent. fat. The five pounds of butter will contain four pounds of fat while the rest will be largely water, a small portion of casein and traces of other matter. To get four pounds of fat from the eight pounds of cream would require half the cream to be fat or 50 per cent. Therefore, cream testing 50 per cent. will make five pounds of butter to the gallon.



What Engine Shall I Buy ?

You say: "Here are a dozen different makes and all well spoken of. I hardly know which one to buy."

Well, any one of them will probably save you a lot of work and be a good investment, but if you select a

Renfrew Standard
It starts without cranking

It will do all the work that any other gasoline engine will do—and it has some special features that Canadian farmes will specially appreciate.

For example, it is a very strong engine, the 6 h.p. Renfrew Standard being almost as large as the average 8 h.p. engine. Canadian farming conditions require a rugged, powerful engine, and the Renfrew Standard fills the bill.

Other Features

Dual Ignition. The Renfrew Standard has two separate ignition systems. 1: batteries. 2: high tension magneto. Having two systems the engine is doubly reliable.

Starts without cranking—Any boy or girl from 10 years up can start and operate it.

Fly ball governor—A governor of the steam engine type that permits the engine to be as closely regulated as a steam engine.

Carburetor—This is one of the features that count in the long run, because it is a remarkably economical carburetor and operates the engine on a small amount of gasoline.

Bearing—Large bearings provided with an adjustment to take up wear.

Frame—Frame and cylinder cast in one insuring perfect alignment.

Commutator—Made of bronze.

Piston—Made of semi-steel with piston rings ground so that they do not vary one-thousandth part of an inch in size.

Balance—So perfectly balanced that the engine does not creep if not anchored.

Pulley—Lever type of friction clutch pulley provided free with engines of 6 h.p. and upwards.

Guarantee—A strong, fair and square guarantee that safeguards every purchaser.

Sizes—1½ h.p. to 60 h.p. Stationary, portable, and semi-portable.

Catalog—FREE. Write for it. It shows the line in detail and gives complete information.

We also have a full line of Ensilage Cutters, Grain Grinders, Saw Frames, etc.

LIVE STOCK.

THE DUAL PURPOSE COW

Professor W. H. Dalrymple, of Baton Rouge, discusses in a circular issued by the Louisiana State University the question whether there is in the States agriculture a place for the dual purpose type of cattle as represented by the Red Poll and Devon breeds. He says:

Close observation, carefully trained; correct information, accurately obtained; and sound judgment, based on such observation and information, intelligently formed, should be the essentials in deciding upon a business policy, whether mercantile, banking, farming, or any other. This is especially true where new lines of effort are proposed, and practical experience may be lacking; and the production of live stock, along the best and safest lines, is one of the new business propositions confronting our Louisiana farmers. In the different branches of farming activities there seems to be a greater diversity of opinion concerning live stock than any other, and more especially, perhaps, in the case of cattle, and this diversity seems, in large measure, to be based, not so much upon the suitability of certain breeds to meet certain conditions, but rather upon the likes and dislikes of the individual regarding particular breeds, irrespective of their suitability or adaptability to local conditions. Or, in other words, the purely business side of the proposition is often lost sight of, or, at least, subordinated to individual taste. It is under such conditions as these that good, sound judgment is required by the farmer in making his decision, as a wrong or careless step at the outset may mean the difference to him between success and disappointment.

It is the right and special prerogative of the farmer to have his own opinion in such matters, of course, but few, as yet, are familiar with the different types and breeds of cattle, the suitability of each for a specific purpose, or to successfully meet local conditions, and his endeavor should be to avoid making errors in selection, which may in some cases prove quite costly.

Balancing Farm Operations

Again, many farmers have not yet reached the point where they carefully figure out how best to balance their farming operations. If they should decide upon cattle for their places, they are often likely to want, or have, too many animals, instead of the approximate number required to meet their immediate conditions, and that the capacity of their farms can take care of and properly maintain. This, it seems to me, is a present tendency and danger that should be guarded against. The farmer should understand that cattle on the diversified farm are a part of the system and have a very important place to fill in enhancing the value of the feeding materials raised, and in providing manure to return to the land to maintain soil fertility and increase crop production. However, these results, which every good farmer desires, may readily be interfered with, either by the possession of more animals than can be profitably provided for by the farm, or by keeping fewer than the feed crops grown would legitimately warrant. In the first instance, the surplus number above those which the farm could profitably maintain may be the means of rendering all of the cattle unprofitable for the lack of sufficient feed to properly develop them. In the second instance, too few cattle kept may lead to a large part of the feed crops having to be disposed of from off the farm, in the raw state, for want of a sufficient number of animals to market them as a finished product and at an enhanced value, besides the loss of a great deal of valuable manure to the land to add to its fertility and improve its physical conditions. It may be seen therefore that in order to practice diversified farming profitably, which means intelligent farming, a balance is necessary, not only as regards the different kinds of crops grown, but equally so as concerns the number of animals required to profitably handle many of these crops from the standpoint of marketing.

Good Types of Cattle

It may be said that all types and breeds of cattle are good, but they are not all equally good nor equally suitable for all purposes and conditions. Again, all farmers are not able to afford the purchase of a foundation herd of all pure-bred animals, but most farmers could probably afford to buy a male animal of pure breeding to grade up and improve the cattle on his place, and in a short while develop a herd of high-grade animals suitable for his special purpose, and which is the method suggested by the writer for many years. The breeding of pure-bred cattle or pure-bred stock of any kind is a business of a special character; requires capital and plenty of experience, and is beyond the practical operation of the majority of our farmers. It is the few who are breeders who maintain the supply demanded for pure-bred stock, but the rank and file are those who expect to raise cattle as a part of a system of diversification, and to supply the markets with beef and dairy products. The three main factors to be considered by the farmer before making his selection should be (1) farm conditions, (2) transportation facilities, and (3) suitable and easily accessible markets. To the man with plenty of rich land, an abundance of nutritious pasturage, and grain and forage crops in addition, whose inclination runs along the lines of beef production, from the purely beef type of cattle, and where the facilities for marketing are all that could be desired, his choice would naturally be one or other of the large beef breeds. On the other hand, the farmer who has all the necessary facilities for transportation, marketing, etc., and who wishes to specialize in dairying, his choice should be one of the breeds which conforms strictly to the dairy type of cattle.

Room for the Dual Purpose Cow

I am of the opinion, however, that there is a class of farmers in the S tate, especially on our hill lands, who may lack the necessary conditions to make beef production profitable from the large beef breeds, and who are inconveniently situated, both as to transportation facilities and accessible markets, for strictly dairy farming, who would be best suited with what is known as the dual-purpose type of cattle. The term "dual-purpose" has received a good deal of criticism from the devotees of the purely-beef and the pure-dairy types of cattle. Nevertheless, records of some of the breeds conforming to the dual-purpose type go to show that they are no mean producers of milk and butter-fat, and that in beef production they are not so very far behind some of the purely-beef breeds, except, perhaps, in size or total weight. In fact, if we take the trouble to investigate, it will be found that in many parts of Europe, for example, the real farmer's cow is the dual-purpose animal, because of its milk-giving and beef-producing tendencies. It is so, especially in parts of

CANADIAN GOVERNMENT
uses
500,000 Square Feet of Paroid
A Real Recommendation of a Real Roofing

The Government authorities, by the use of over half a million square feet of Neponset Paroid Roofing in Camp Borden and for the military barracks at Hamilton and at Halifax, fully endorse the preference of thousands of farmers and builders all over Canada for

NEPONSET
Paroid
ROOFING

Hundreds of Paroid Roofs—18 years old and upwards—prove the durability—and economy, too—of this fire and weather-resisting roll roofing. It is the least expensive roofing in the world, because it gives such long, hard service under the MOST TRYING conditions on farm buildings, factories and railroad buildings.

LOOK FOR THE PAROID ROLL

Paroid is sold by over two thousand Neponset dealers in Canada. It is made in three colors—grey, green and red. Saturated through and through with asphalt, it will not dry out, curl up, split or crack, and will not run in the hottest weather.

Everjet Elastic Paint

An Ideal Farm Paint

Around the farm or home, wherever you have surfaces exposed to wind, wear and weather, you can save money and the trouble of renewing things, by using Everjet Elastic Paint.

Carbon paints are the most durable of all and Everjet is the best carbon paint ever made. It is the ideal roof paint. Stops deterioration and leaks; adds a good many years to the life of a roof.

Wonderful on metal surfaces because it is elastic and will not peel or crack under temperature changes. It will keep your implements fit. Try some. You will never be without it.

Advertise in The Maritime Farmer.

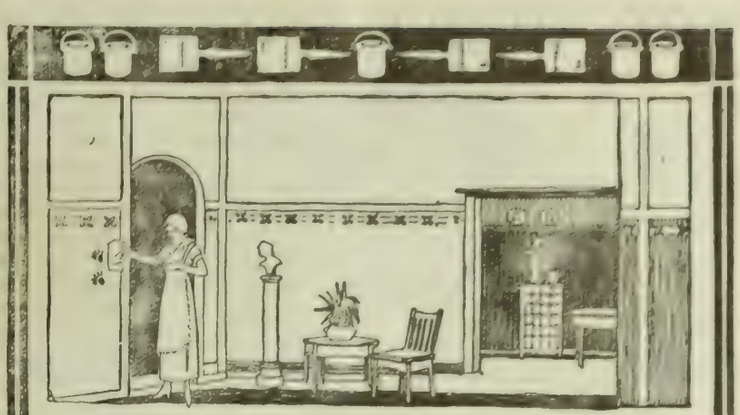
England, where the milking type of the Shorthorn (the largest of the dual-purpose type) is to be found on every farm for both dairy and beef production. In the counties of Norfolk and Suffolk, in England, the home of the Red Polls, it is this breed which furnishes the milk, butter and beef for the people. And the same may be said of the Devon cattle in the English county of that name, and in the surrounding territory. So that, while no other breeds will compare with the special purpose types in milk, butter-fat, and beef production, espectively, it seems to the writer that there are many localities and existing conditions in the State in which the general-purpose animal would be more profitable, and fit in better with the conditions, than either of the extreme or special types.

Take, for example, the farmer who does not have the facilities for specializing in either dairying or beef production on a paying basis. He is miles from any railroad, and a market for such products is altogether inaccessible. It is his desire, however, to keep a reasonable number of cattle on his place as a part of his system of diversification incidentally to supply his own household with milk and its products, but mainly to increase the value of his feed crops, including his pasturage, of course, furnish manure for the land, gradually improve the quality and increase the number of his herd by raising good calves, the steer progeny of which, when in condition, are likely to command good beef prices on some local market, etc. It is under such conditions, it would seem to the writer, that the dual-purpose animal becomes a special-purpose one for this class of farmer. The heavy milk producers would be a loss to him, because he would be unable profitably to consume the product, and the steer calves of this type of cattle are unprofitable in the beef market. The large, heavy, beef-type of cattle would hardly be profitable, as their milk production is limited; they require large amounts of nutritious feed to put them in good shape, and unless they are in good condition, either as feeders or as a finished marketable product, and a suitable market for them convenient, success in the growing of them, on farms such as have been alluded to, would be extremely doubtful.

But the animal that furnishes enough milk for home consumption, and plenty in addition to raise vigorous calves; that can fill all the requirements for which cattle are usually kept on the diversified farm, and from which the farmer can annually raise a small bunch of good steer calves that he can sell locally at satisfactory prices, is, in our opinion, the type of cattle that our hill farmers, or many of them at least, stand most in need of; and it is here where the Red Poll and the Devon breeds seem to have a place to fill.

Red Polls

Now let us see what some of the authorities have to say concerning these two breeds, taking up the Red Poll first: I take the following from the Cyclopaedia of American Agriculture:—"Red Poll cattle are a dual-purpose breed, and have made quite a number of very creditable records in both dairy and slaughter tests. At the International Live Stock Exposition, Chicago, in 1906, the highest percentage of dressed carcase to live weight was given to a two-year-old Aberdeen Angus (which is a purely beef type) with 69.5; while a two-year-old Red Poll steer came second with 69.2 per cent. At the Wisconsin State Fair, in 1907, in a three-days' test, a Red Poll cow gave 125 pounds and 12 ounces of milk, and made 5.336 pounds of butter-fat. For crossing and grading, Red Poll pulls have been used extensively and with good results. They transmit the colour and polled character uniformly, and may be used profitably on either dairy or beef common stock."



Washable Walls

No matter if children soil the walls with grimy fingers—no permanent damage done by the soot of a smoky stove—no need to remove dingy paper at frequent intervals—if your walls are finished with

FRESCO-TONE

The easily-applied artistic wall finish.

Children's markings, soot, grease or dirt, may be easily washed away, leaving the surface as bright and clean as when it was first applied.

Fresco-Tone has all the soft, artistic beauty of water colors—and yet possesses the durability of high-grade oil paint. It is made in twenty beautiful shades; may be used over paper, plaster, burlap, or wood; is easily applied, and retains its original velvety beauty for many years.

Fresco-Tone Your Walls This Fall

THE HORSE

THE STALLION TO BREED FROM

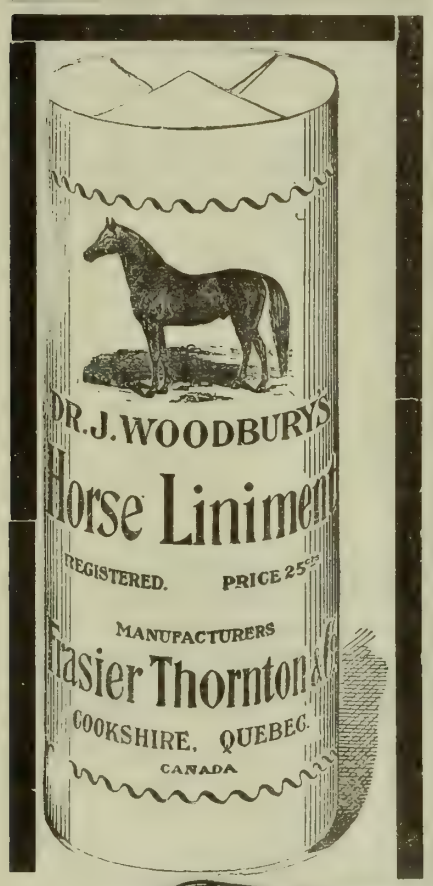
Since the ability to stamp his characteristics on his progeny is the only really important point in selecting a sire, improvement of our stock can only result from our ability to pick out such a sire and consistently breed to him. The one sure and best method is by carefully observing the progeny got by the horse from our own and other mares in the vicinity. Too frequently, however, we are not table to do this, and must make our selection wholly on the appearance of the horse. Stallion license laws have created a constantly shifting population of scrub or unsound horses, and too much discrimination cannot be used in getting not only the right type but sound pedigreed sires.

As stated, prepotency is essential, and it is well indicated by certain characteristics. Boldness of outlook, free spirited action and strong masculine appearance mark the horse with ability to pass on his characteristics to his foals. We well remember having seen a black two-year-old Percheron colt at the head of his class last summer that we venture to say will leave colts like himself. He was a slashing good colt that put on his own show. Given his head he got up and moved with such freedom and precision, strength and power, and brought his feet down so solidly that he simply made everybody look at him. He was "looking for a bigger town." This is the result of breeding, and with good conformation and soundness one of the first things to be looked for. A horse with a sleepy appearance, a mare's head and a ewe neck may do for the other fellow to breed from, but not for the man who wants real character in his colts.

In spite of supposed evolution of horse demand a decided premium is put on the big draft horse. And it will doubtless continue to be. In breeding for the big ones we get lots of the class called chunks. In other words, we need horses of size for sires. The bigger the better, provided we can keep a fairly good degree of quality and style associated with it. We would prefer, however, a horse of 1,600 pounds, closely ribbed and fairly compact conformation, good quality and active style, to an 1800-pound or 2,000-pound horse of open conformation, slovenly gait and coarse quality. The reason is that the get of the former horse are apt to be good with the one main drawback—lack of size, but they are always in demand at fair prices, while the get of the big horse in this case may be anything at all and not worth nearly as much on an average as the other class. Long couplings, short ribs, slack loins, narrow and shallow chests and light quarters are things n ot to have in a horse. A wasp-waisted stallion will get too many colts like himself. Furthermore, violent crosses, i. e., crossing too big a stallion on a little mare is apt to beget scrubs, with something altogether disproportionate about them.

Quality is of the very greatest importance. It is best indicated by fineness of hair on both body and legs, fineness of the skin, clean, flat nature of the bone or tendons of the legs, distinctness of the veining after exertion, and general refinement of conformation. No one can altogether define quality. It must be seen to be appreciated, and it delights the eye of a real horseman. Too frequently in our show rings we see small, undersized horses bragged about for their quality, when too often it is under development. Not long ago we saw a runt of a three-year-old Clydesdale win a second place in a class of big horses simply because his quality was superfine and his action flashy. He later competed for championship against a two-year-old that was not only considerably larger but almost his equal in quality, but fortunately didn't win here.

Unsoundness, of course, ought not to be countenanced at all, i. e., hereditary unsoundness. Bone spavins, ringbones, sidebones, thoroughpins and bog spavins are the most common, and anyone can easily pick them out with the eye or by running the hand closely over the hocks, fetlocks and hoofheads. In fact, cleanness of limb is essential. The first three unsoundnesses are the worst. All should be avoided. Unsound horses will beget colts predisposed to disease, and nothing reduces the market price of a horse like a set of unsound legs.



WHEN FOALS NEED PROTECTION

Many foals fare worse in early fall than they did in midsummer. During the hard summer work when the mare was in daily use her foal spent the daytime in the stable away from the flies. Now that the work is less pressing perhaps the old mare is turned out to pasture day and night with her foal, and relieved of hard work. It is fine for the mare. She gets to rest and gain flesh. But the foal, unused to the constant daytime attacks of bloodthirsty flies, suffers great pain. It is kept in such a steady state of agitation and fly-fighting activity that it does not thrive. Then when weaning time comes and another obstacle is thrown in its way, a very good-looking summer foal may dwindle away to a puny-looking weanling.

Flesh and thrift of foals must be maintained at this time of year. The season for rapid, cheap pasture gains is rapidly passing. If the foal is thin and weak at weaning time it will be below average all winter unless particular attention and the choicest feeding are given. The youngster that grows right up through the fall, and is eating a lot of grain before weaning will keep on thriving with plain oats and alfalfa hay or other similarly nutritious farm grain and hay. A selection of temptingly-flavored feeds and sometimes the addition of cow's milk are often required to get the stunted foal into thriving condition during cold weather. It is much easier to keep the youngsters coming on rapidly now and fly-protection helps very much.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

GIVING HENS A CHOICE OF FOOD

Perhaps the best way to find out what hens like is to ask the hens. At least that was the plan followed by the Missouri Agricultural Experiment Station in recent tests in which weighed amounts of various feeds wede placed before the hens and what they left of each kind of feed was weighed back, so it was possible to tell what kinds of feed they had eaten and what they had passed by. At the same time a careful record was kept of the number of eggs laid by each hen and her changes in weight.

The test seems to show that the hen knows better than many people how to select the food that will help her most in laying eggs and keep her in the best condition. Some old ideas with regard to poultry feeding were proved sound and some others were discredited by the hens. They almost all showed a decided preference for wheat, which is very generally used as a poultry feed. Kafir stood next in popularity, followed by corn and corn meal, but oats and sunflowers were not eaten as much as many people would have expected, probably because the hen is not able to digest much food containing a high percentage of crude fibre. The hens that did eat sunflower seed were seen cracking them and eating only the softer portions inside, possibly because they wanted to get rid of the crude fibre in the shell.

Bran is often used in poultry feeding but the hens in this test which could get other feed almost always chose it instead of bran. Alfalfa leaves were tried but not eaten to any great extent.

Animal food of some kind, such as beef scrap or sour milk, is generally regarded as very necessary for laying hens but most of the hens in this test did not eat much more beef scrap while laying than while not laying. Two actually ate more of it when they were not laying.

Other tests at the Missouri Station have shown that the use of either beef scrap or sour milk makes the hen's egg record at least twice as good as though she were fed no animal feed whatever, and that sour milk is slightly better than beef scrap for this purpose, in addition to being cheaper and easier to get on most farms.

TREATING DIPHTHERITIC ROUP

This canker of chickens, which is more commonly termed "diphtheria" or "diphtheritic roup," is often clearly an advanced stage of roup. It is indicated by a cold accompanied by whitish and yellowish patches on the back of the throat and in the mouth. A false membrane is apparently formed by these patches and cannot be torn off without causing bleeding. As diphtheria is extremely infectious, it is decidedly the best course to kill all cases at once.

However, if the individual bird is of particular value it may be isolated and the patches on the throat swabbed with 50 per cent peroxide of hydrogen or 5 per cent. creolin with a small bit of cotton wool wound round a stick. If great care is exercised, 20 per cent. carbolic acid or 20 per cent. creolin may be painted on the patches, but neither should be allowed to touch the normal skin.

The roupy symptoms of cold, running at the nostrils, sneezing and the swollen and inflamed eyes may be treated with 5 per cent. carbolic acid, 50 per cent. peroxide of hydrogen, or 2 per cent. permanganate of potash. In using the latter the fowl's head may be dipped for a few seconds in the solution. All sick fowls must be isolated from the rest of the flock and the premises disinfected with any reliable disinfectant. However, unless the sick fowls are especially valuable, kill and burn them or bury them deeply.

To-night!

Try a cup of this famous cocoa before retiring. Next morning note the vigor it imparts. The reason is simple — the best cocoa beans are highly nutritious and wholesome. Perfection Cocoa is made from positively the finest cocoa beans grown — blended skillfully.

It's a good habit — a cup of cocoa a night — but be sure that it is

DISPOSE OF MALES AS BROILERS

Approximately 50 per cent. of the chicks hatched every year are cockerels. As only a few of these are retained as breeders, this means that millions of male birds must be disposed of between midsummer and fall. Quite naturally it happens that there is a large surplus of stock on the fall market with prices ruling lower than at any other season of the year.

For broilers, the early hatched broods reach the desired weights before the large supply becomes available, consequently bringing in the best revenue. Broiler weights vary in different sections of the country, all depending upon the season of the year. Each producer should keep in touch with the local market situation and act accordingly. We aim to produce stock weighing about one to two pounds each, live weight.

A few weeks previous to killing, the birds are kept quiet and comfortable and are not permitted to take much exercise. Our ration consists of considerable corn meal, middlings and animal food fed in moist condition. In this form it seems to induce a more rapid growth. We also feed large quantities of skim milk.

THE MYSTERIOUS DISAPPEARANCE

By Erskine M. Hamilton

"Where is Sallie Landor?" No one could answer that question, although pallid lips asked it over and over again. Sallie Landor, a beautiful girl and daughter of a well-known business man, had mysteriously disappeared. She had vanished from her home as though the earth had suddenly opened and swallowed her. When her father came from his store that June evening he found his daughter in the kitchen, preparing supper. Passing on to the sitting room he saw Mrs. Landor for a few minutes, then returned to the kitchen. The supper was on the stove, apparently ready to be taken up, but no one was there to care for it.

"Where is Sallie?" he asked, turning back and speaking to his wife. "I want my supper, for I must go back to the store tonight."

"Why I thought she was in the kitchen," replied Mrs. Landor. "Probably she has gone to one of the neighbors for something. I'll be there in a minute and get things for you."

Mr. Landor soon had his meal before him, and returned to his store. Two hours later he was startled by his wife, who came hurrying in, accompanied by two lady friends.

"John," she exclaimed, "I'm afraid something has happened to Sallie! She has just disappeared, and we can't find her. We've looked everywhere," and the worried woman sank upon a chair and began to cry.

"Oh, I guess she's around somewhere," said Mr. Landor, soothingly. "Have you inquired at Mr. Hartman's? She often goes there, you know."

"No, she is not there. We have looked for her at every house we can think of where she might possibly be, and no one has seen her," answered one of the lady friends.

Mr. Landor also became anxious, and closing his store he accompanied the ladies to the street.

"We will go home first and make a thorough examination there," he said, walking so rapidly that his companions could hardly keep pace with him.

It was getting dark by this time, and as news of the disappearance spread through the little community, a goodly number joined in the search. The Landor homestead was at the outskirts of the village, there being no other house beyond it, and when the party reached it every place where the missing girl might be was closely examined. Barns, cellars, cisterns, wells, outbuildings—all were searched without result. The various houses and premises of the village were also visited, and parties of men scoured the adjacent woods, but there was nothing to show what had become of Sallie Landor.

The keen eyes of a small boy, however, were the first to discover a tangible clue. Little Johnny Sprague had followed the group of sympathizing neighbors who had gone back with the grief-stricken father and mother to their home. When they entered the house he wandered around to the kitchen door and began a search on his own account.

"Mebbe some kidsnappers has carried her off to sell her to the doctors in Philadelphy to make into a skelington," he questioned, as he remembered certain gruesome stories. "Mebbe they've got her all cut to pieces by this time, an' strung up on wires—like the one I seen at Dr. Brown's office—an' we'll never find her."

He walked slowly toward a flower bed, a short distance from the kitchen door. Johnny liked flowers, and he stooped to pick one, when his quick eye noticed in the dim light that right through the middle of the bed the flowers were lying prostrate and bruised, as if some heavy body had been dragged across and crushed them down. Eagerly and carefully he looked beyond the flower bed, and easily made out the trailing mark until it came to a slight fence which had been erected around the garden. At this point the fence had been pushed or pulled down, and the trail entered a plowed field. Johnny carefully followed it until he arrived at a tree that stood by itself in the centre of the field. Here the trail ended, but the boy's heart bounded as he picked up a lady's handkerchief from the ground. Then he looked up into the tree, and another surprise awaited him. Caught in an upper branch was a fluttering piece of cloth.

"Gee! What d'ye s'pose the kidsnappers carried her up into that tree for?"

Johnny could not answer the question, but he was sure he had made an important discovery, and he scurried back to the house as fast as his small legs could carry him. Rushing in upon the sorrowing group he threw the handkerchief into Mrs. Landor's lap.

"Why, Johnny Sprague!" exclaimed the astonished woman. "Where did you get this? It is Sallie's handkerchief."

"Found it out in the field, an' there's a piece of her dress stickin' up in a tree. I guess the kidsnappers must have tored it off to gag her with," answered Johnny, proud of his success where others had failed. "Come out an' I'll show you."

Despair at once changed to eager interest. Lanterns were procured, and the boy guided the party to the flower bed and pointed to the trailing mark across it, and on through the garden and field to the tree. At Mrs. Landor's request he climbed the tree and brought down the bit of cloth, which was easily identified as a piece of Sallie's dress. Search was made for other marks or clues, but none were found.

Who or what had been dragged across the soft ground to the tree? How came Sallie's handkerchief there? By what means had a piece of her dress been torn from her and then deposited among the branches? The father and mother looked appealingly from face to face, but only Sam Harding, the village constable, offered a esusgg onis'taoincmfwypshrdlubgkqj suggestion.

"This beats me," he said. "Generally speakin', when folks disappear, there's somethin' to show where they've gone; but in this case there's jest nothin'. The disappearance seems to begin at a flower bed an' end up a tree. I think I'd better go over to the Wilber Station an' get Tom Rankin's dogs. Maybe they can scent this matter out."

"I wish you would, Sam," responded Mr. Landor. "It will be a great relief to us to find something definite."

The following morning Tom Rankin came with his dogs. They kuickly took the trail at the flower bed and dashed on unerringly to the tree. There they stopped, and with noses pointed upward, barked vociferously.

"Well, if this ain't a puzzler!" exclaimed Tom Rankin. "I'll stand by my dogs; they make no mistake. The girl was up in that tree, an' she didn't come down, but how did she get away from it, I'd like to know?"

Everybody believed that Sallie Landor had been dragged from her home to the lone tree in the field. That seemed settled beyond dispute. But from the tree—how, by whom, and where had she been taken? The impossible had apparently occurred, and conjectures and surmises were as frequent as they were useless.

Mr. Landor did not remain idle. The peace of his home depended on getting some definite news of his missing daughter. He advertised in leading newspapers, offering a large reward, but no answer was received. Acting on advice of friends he sought the aid of a well-known detective agency. The agency sent one of their best men to the village. As he had a reputation to maintain, he felt bound to explain the mystery, and accompanied by Sam Harding, he visited the Landor homestead, the tree in the field, and asked numerous questions. At the conclusion of his investigation he announced sententiously:

"The girl has eloped."

"Eloped?" echoed Sam, not at all impressed by the eminent detective. "How could she elope up a tree?"

"That's just a blind for you country folks, but she can't fool me," snapped the detective. "She has eloped all the same. If you can find the man she has gone off with, you'll find the girl."

"Well, if that ain't brilliancy to beat Sherlock Holmes!" declared Sam, sarcastically. "Mr. Landor has hired you to come here to tell us country jakes that if we can find where his daughter has gone we can go an' get her. That's what it amounts to. You're a great detective—you are, indeed!"

Sam had the greatest respect for Sallie Landor, and the insinuation that she had eloped aroused his anger. The detective, however, did not wait for further comments, but took the first trai nthat would carry him home. So the matter ended. All efforts had failed, and as days passed into weeks the sorrowing father and mother could only watch and wait for the possible return of the loved one.

It was more than three weeks before Sallie could settle the problem of her whereabouts to her own satisfaction. She had gone to the flower bed to pick a few blossoms to adorn the supper table. While bending over the mass of foliage she suddenly heard a whirring sound, and looking up caught a glimpse of some huge object apparently swooping down upon her. Then something behind seized the belt of her dress, and in an instant she was being dragged across the garden, tearing down the frail fence, and over into the field beyond. A moment more and she was conscious of a sharp pain in her right arm, and this was followed by a blow on her head. After that she knew no more until she opened her eyes amid strange surroundings. She was lying on a bed in a large, elegantly furnished room. Beautiful pictures were on the walls, soft, rich rugs on the floor, and over by a window a young woman, in the garb of a nurse, was sitting. What did it all mean? Was she dreaming? No, it certainly was not a dream, she—

"Thank the Lord!" and a pair of serious gray eyes were looking down into hers.

"Yes, I should say so, though I don't know why you should thank the Lord," answered Sallie with some asperity, and in a voice that alarmed her by its weakness. "Who are you, and why am I here?"

"I am Dr. Charles Nelson, and you are here to rest and get well," was the smiling reply.

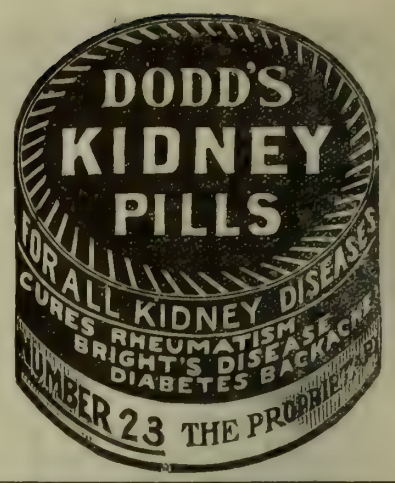
Sallie lay quiet for a few minutes—she was so weak—and calmly surveyed Dr. Nelson. He certainly was a fine looking young man, and the strong, kindly face especially attracted her.

"Well, Dr. Nelson, please explain. What does all this mean?"

"It means that if you had died I never would have forgiven myself," he replied, his expression being so extremely serious that Sallie laughed.

BETTER THAN SPANKING

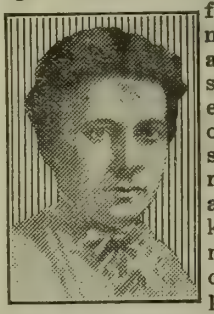
Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.



AFTER SIX YEARS OF SUFFERING

Woman Made Well by Lydia E. Pinkham's Vegetable Compound.

Columbus, Ohio.—"I had almost given up. I had been sick for six years with



female troubles and nervousness. I had a pain in my right side and could not eat anything without hurting my stomach. I could not drink cold water at all nor eat any kind of raw fruit, nor fresh meat nor chicken. From 178 pounds I went to 118 and would get so weak at times that I fell over. I began to take Lydia E. Pinkham's Vegetable Compound, and ten days later I could eat and it did not hurt my stomach. I have taken the medicine ever since and I feel like a new woman. I now weigh 127 pounds so you can see what it has done for me already. My husband says he knows your medicine has saved my life."—Mrs. J. S. BARLOW, 1624 South 4th St., Columbus, Ohio.

Lydia E. Pinkham's Vegetable Compound contains just the virtues of roots and herbs needed to restore health and strength to the weakened organs of the body. That is why Mrs. Barlow, a chronic invalid, recovered so completely.

It pays for women suffering from any female ailments to insist upon having Lydia E. Pinkham's Vegetable Compound.

Was Troubled With Stomach and Liver

FOR SEVEN YEARS.

MILBURN'S LAXA-LIVER PILLS

CURED HER.

Mrs. Thomas Sargent, Berkeley, Ont. writes: "I have been troubled with my stomach and liver for the past seven years; also have had constipation, causing headaches, backaches and dizzy spells, and at times I would almost fall down. I tried all kinds of medicine, without obtaining any relief. I commenced using Milburn's Laxa-Liver Pills, and they have cured me. I have recommended them to many of my friends, and they are all very much pleased with the results they have obtained from their use."

Milburn's Laxa-Liver Pills have been on the market for the past twenty-five years, and can be procured from all dealers.

The price is 25 cents per vial, or five vials for $1.00.

If your dealer does not keep them, they will be mailed direct on receipt of price, by The T. Milburn Co., Limited, Toronto, Ont.

"It was no laughing matter that brought yo uhere, young lady—I can assure you of that," he added with a faint smile.

"I beg pardon, doctor," said Sallie, flushing slightly. "I do not know the circumstances of my coming, and, of course, do not appreciate your view of it."

"Of course you do not, but before telling you the story, I wish to know your name and address, that I may telegraph to your friends. Your family may be very anxious about you."

Sallie's face clouded. Her father and mother would certainly be worried by her prolonged absence. She gave the desired information, and the doctor hurried away. An hour later he returned.

"I communicated with your people, Miss Landor," he said, "and they were overjoyed to hear from you. Your father and mother will be here tomorrow afternoon."

"Thank you for your kindness," replied Sallie, growing cheerful again. "Now give me the particulars of my removal—or abduction would be a better name, perhaps—from my father's house."

"Abduction is the proper word," laughed the doctor, "andI assure you it occurred without your consent, or mine. You are now at my home in one of the suburbs of Philadelphia, and this is the story:

"I am greatly interested in aviation, and have an airship of my own invention. One evening, a little over three weeks ago, I started out with my assistant to test some changes I had made. I was so absorbed in the working of my machine that I did not notice, particularly, in which direction we were flying. We were near the ground, I remember, and moving slowly, when, suddenly, some weight seemed to have been added to the machine. Looking over I was horrified when I discovered the cause. By careless or mischance a drag-rope—which I seldom carry or use—had been allowed to drop and trail along the ground, and there, caught by the grappling hook. was a woman."

"Ah, I see now! I was the fish you caught with your hook," interrupted Sallie, mischievously. "What bait did you use, doctor?"

"There was no bait used, but I did succeed in catching a very beautiful young lady," replied the doctor, bowing profoundly. "However, I was not thinking about beauty just then—I was too badly scared for that. You were being dragged along the ground when I first saw you, and before it could be prevented you were dashed against a tree; in fact, my assistant and I pulled you up through the branches.

"You were unconscious, and I saw at once you were severely hurt. Of course we hastened home, and you have been here ever since. I found your right arm was badly bruised, and you had received a blow near the right temple. The injury to the head was the most serious, for fever set in, and all along you have been delirious. You can see that during these weeks I have had a very anxious time, but my worry is over now. You're out of danger."

"It was certainly a strange happening, Dr. Nelson, although I knew but little about it at the time," said Sallie, a faint color coming to her face as she noted the admiring look of the gray eyes. I feel quite comfortable now, except that I am yet so weak. When can I go home?"

"I can hardly tell you that. As your doctor I think you ought to remain here at least three weeks longer."

"Oh, dear! My father and mother will not consent to so long a stay as that, and besides——"

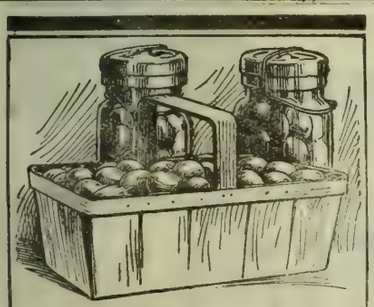
"We'll see about that when they come," interrupted the doctor, with a laugh. "However, we have talked enough and you must rest."

It was more than three weeks before Dr. Nelson pronounced his patient strong enough to go home. Indeed, he would have prolonged her stay, had not Sallie, although she was having a good time, insisted on going. The doctor yielded, and then declared he would go with her.

"I stole something precious from your father's garden on one occasion," he explained, "and I'm going to see that the goods are safely returned."

Johnny Sprague was at the railway station when the group of friends gathered to greet Sallie. He looked at her critically, and then at Dr. Nelson, as the two stepped from the car to the station platform.

"Gee!" he exclaimed disgustedly, as he turned away. "'Twas a doctor who kidsnapped her after all. but he ain't goin' to cut her up to make a skelington. He's just goin' to marry her!"



Plums

have a spicy zest which makes them a favorite preserving fruit, and several excellent varieties are plentiful this year. Preserve all you can with

CLARE BROS. & CO. LIMITED - PRESTON

LIGHTER DAY HIGH OVEN COAL RANGE

CURES BILIOUSNESS PREVENTS BRIGHT'S DISEASE

The Certified Statement of One Who Has Proven the Efficiency of Dr. Chase's Kidney-Liver Pills.

Mr. Colin M. Keil, Craighurst, Simcoe County, Ontario, writes: "My mother and I have both used Dr. Chase's Kidney-Liver Pills with great satisfaction. We find that there is nothing to equal them as a prompt cure for torpid liver, biliousness and indigestion. Some years ago my mother came near to death from kidney trouble and has to be careful in preventing Bright's disease. By using Dr. Chase's Kidney-Liver Pills occasionally she keeps the kidneys healthy and active. Another point favorable to Dr. Chase's Kidney-Liver Pills is that they do not gripe and yet accomplish good results. You are at liberty to use my letter."

This statement is endorsed by Mr. Marmaduke Caston, Justice of the Peace, who writes: "This is to certify that I am personally acquainted with Mr. Colin M. Keil and believe his statement regarding Dr. Chase's Kidney-Liver Pills to be true and correct."

If you are interested in this case, write to Mr. Kiel, enclosing stamp for reply, and he will verify his statement. We like to have people to do this, for we are very careful to only use statements from responsible persons.

Sould this case not be similar to yours, write to us for the statement of some one whose trouble was along the same lines. We have thousands of letters to choose from. Or better still, put the Kidney-Liver Pills to the test right away. They will only cost you a quarter and a box lasts for some time.

As a means of awakening the action of liver, kidneys and bowels and thereby curing biliousness, indigestion, backache and kidney troubles, Dr. Chase's Kidney-Liver Pills hold a unique position. By their combined action on these eliminating organs they prove effective in complicated ailments which defy ordinary treatment. One pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Company, Limited, Toronto.

Had Pimples and Festering Sores ON HER FACE.

When the blood gets bad, boils, pimples and festering sores are sure to break out on the face and body. To get rid of them the blood should be cleansed by Burdock Blood Bitters.

Mrs. Charles Jewell, Orrville, Ont., writes: "I feel it my duty to write and tell you about what Burdock Blood Bitters has done for me. I was so pale I had no color at all. I also had pimples and festering sores on my face, and my head ached nearly all the time. I had been reading in the paper, and saw that Burdock Blood Bitters was good for such troubles so I tried a bottle and before it was half done I felt fine, and when the bottle was finished I felt like a new woman. I tell all my friends about it, and advise everyone suffering from such trouble to use B.B.B."

There is only one B.B.B. That is the genuine, manufactured by The T. Milburn Co., Limited, Toronto, Ont.

St. Joseph, Levis, July 14, 1903.
Minard's Liniment Co., Limited.

Gentlemen—I was badly kicked by my horse last May, and after using several preparations on my leg nothing would do. My leg was black as jet. I was laid up in bed for a fortnight and could not walk. After using three bottles of your MINARD'S LINIMENT I was perfectly cured, so that I could start on the road.

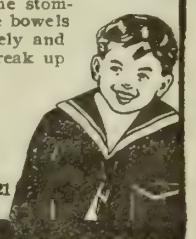
JOS. DUBES,
Commercial Traveller.

SICK TO DAY!

Disorders of the stomach and constipation are so common with children. Mothers should know that Chamberlain's Tablets are mild and gentle, but very effective. The little folk often need a cathartic, and they do appreciate Chamberlain's Tablets instead of nauseous oils and mixtures.

CHAMBERLAIN'S TABLETS
Good for children

You should always keep a bottle on the shelf. A little dose at night and the fretful, feverish little chap wakes up bright and sunny in the morning. The liver is stimulated, the stomach cleansed and the bowels purified, but all safely and gently. They help break up a cold very quickly.



Get Chamberlain's Tablets at druggists, 25c, or by mail from Chamberlain Medicine Co., Toronto. 21

STOP A COLD IN ONE NIGHT

Take

VENO'S LIGHTNING COUGH CURE

You cannot always avoid coughs, colds, and La Grippe, but you can avoid letting them develop into more serious trouble. Veno's Lightning Cough Cure will stop an ordinary cough in one night if taken on the first indication of trouble. A dose in time may save you from long illness and heavy expense. Keep Veno's ready for use should you or your children need it. Being free from dope it is the safest remedy for children. Veno's Lightning Cough Cure is the famous British remedy, and is sold in every part of the British Empire. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

"Canadians at Ypres"

(See Store Windows)

Twelve Outer Covers from the 60-cent size of Veno's Lightning Cough Cure, or 24 from the 30-cent size, mailed to Harold F. Ritchie & Co., Ltd., 10 McCaul street, Toronto, entitle you to a beautiful coloured reproduction of this famous Royal Academy painting. The reproduction is on view in most druggists' windows.

Save Fuel & Food
WITH an ENTERPRISE HEAT ECONOMISER on this MONARCH range you have the latest and greatest invention of the age. Based on a scientific principle it saves fuel by saving heat. This one device will save a very large proportion of the first cost of your range in the course of a year.
With the Oven Thermometer and Controller Damper you are able to cook almost automatically which means a great saving in food which is never spoiled when cooked on an Enterprise Monarch.
Convenient Towel Racks
Large Warming Closet.

GRAY-DORT $885

SHAMROCK 4-PASSENGER ROADSTER

New Ideas in Design ! New Notions of Comfort !
New Proofs of Gigantic Power !

SPECIFICATIONS

Motor—Gray-Dort, 4 cylinder, cast en bloc, L-head type, bore 3¼ in., stroke 5 in., horse-power 28. Carter Carburetor. Thermosyphon cooling, pump and splash lubrication. Westinghouse two unit starting and lighting system. Connecticut battery ignition. Three speed and reverse selective transmission. Gasoline tank under cowl. Springs—front 37 in. elliptic, rear 50 in. full cantilever. Left hand drive. Centre control. 30 x 3½ Dominion tires. Nobby Tread rear. Westinghouse electric lighting. Linoleum covered running board. Lock ignition switch. Dashlight, ameter, robe rail, footrail, clear-vision windshield, one-man top, tools, equipment complete. Divided front seats, tilted windshield, wheel base 105 inches. Weight 2080 pounds.

GRAY-DORT MOTORS, Ltd.
Chatham, Ont.
American Factory at
Flint, Mich.

The biggest, best surprise for 1917 is here—a car that will merit the enthusiastic praise of Canadian motorists. Big and graceful; luxuriously roomy; a car whose style and character stand apart in any crowd. Examine this new Shamrock Gray-Dort Roadster.

A new-idea roadster—designed to hold the road, make easier-going. Yet roomy as a touring car, giving full comfort for four passengers. A car with roadster qualities and touring comfort. The ideal small-family car.

Above all there's the same wonderful motor as gives renown to the Gray-Dort Touring Car; the same motor that Peugot-famed Planche created—giant-like in its reserve of power; velvet-like in its purr and smooth running.

THE DUAL PURPOSE COW

(Continued from page 13)

in the London market. The merits of Red Polls as medium-sized dual-purpose cattle, and particularly, their reliability as milk producers, have led to their being exported in considerable numbers to practically all of the colonies, and to many foreign countries. In the United States they appear to be the most popular of the purely dual-purpose cattle, and are rapidly increasing in numbers," etc. Prof. Plumb, in his "Types and Breeds of Farm Animals," says of this breed: "Animals of this breed present the dual-purpose type in its truest form, for good specimens yield milk liberally and fatten satisfactorily on drying off, producing a good grade of beef." Prof. Thomas Shaw, of Minnesota, says, in his "Study of Breeds": "The medium-sized bodies and the inherited influences arising from environment adapt the Red Polls in an eminent degree to average arable conditions; and the same inheritance best adapts them to equable climates, although they will doubtless thrive in more severe climates as well as many other breeds. The Red Polls are more uniform and persistent in their milking qualities than many other breeds. The average weight of mature cows would be about 1200 to 1250 pounds. They stand midway between the Shorthorns and the Devons. They are most at home where food is plentiful, but can probably gather the same better than their heavier rivals. In no breed, perhaps, is the tendency so strong to produce abundantly when in milk, and at the same time to fatten rapidly when dry. The steers, though of good, fair size, fatten smoothly and cheaply, kill well, and make an excellent quality of beef. They are highly adapted for being crossed upon common stocks to improve them, both in form and utility. The progency have a close resemblance to the Red Polls in form, appearance and qualities."

The Devon

With reference to the Devon, also classed with the dual-purpose breeds, the Cyclopaedia of American Agriculture says:—"While the Devons are not, primarily, dairy cattle, some splendid milk producers have been developed. Although the quantity of the milk yield is not large, the quality is good, which gives them definite value for butter-making. A chief recommendation of the Devon for beef is that it dresses out with little waste, and the meat is of very superior quality. The animals make good gains under stall-feeding, but cannot be forced to so great an extent as some of the other breeds, and generally are lighter when marketed. The breed is small (compared with the large beef breeds), which has sometimes militated against it for meat purposes. As grazing cattle, they stand in the front rank, as they are active and hardy, and have been accustomed to rustle on light, hilly pastures. Prepotency is a characteristic of the Devon cattle, due to their pure breeding for so long a period and when crossed on grade or common cows, the results are very satisfactory for both meat- and milk-production."

Prof. Wallace says of this breed, of which there are really two types in the old country, the North Devon and the South Devon:—"The original Devons were a working and grazing breed and the average cow is only a moderate milker, though greater attention is now paid to the milking powers, and there are several pedigree herds kept largely for dairy purposes. The milch cows retain their flesh well, and fatten into good beef after their fourth or fifth calf." Regarding the South Devon, the same authority remarks: "Within the last thirty years the South Devon has obtained a well-deserved recognition as a general-purpose animal. The breed has spread to the surrounding counties, and there is a growing demand for animals for shipment abroad. Cows of 900 and 1000 gallons of milk yield per annum exist in the best herds, and the milk is of a slightly higher quality than that of average dual-purpose cattle." The other authorities quoted have similar statements to make about this breed. Prof. Plumb says that:—"The Devon in grading or crossing has seen much service in the eastern United States. Owing to its long pure inheritance, the breed characteristics are usually strongly transmitted. Devon bulls on grade cows will produce a superior class of beef and rich milk." And Shaw states:—"Devons are noted rather for the quality than the quantity of their milk. Their good grazing qualities adapt them to localities where the land is broken, and the soil possessed of but moderate fertility; and their fair milking qualities fit them for situations where the arable portions of the land are small in proportion to pastoral, and where at the same time the system of farming is of the mixed order. The grazing qualities of the Devons are of the first order; they readily obtain a good livelihood on lands where the heavy-bodied breeds would probably fail; and when food is plentiful, they fatten quickly. They should answer well for crossing upon common stocks where the aim is to improve the ireasy keeping qualities without impairing their butter-producing powers. The grades from Devons are well adapted to the home (local) market, as they may be fattened at any age."

Such, then, is a brief summary of the opinions of some of the authorities with regard to these two breeds of dual-purpose cattle, and, to some extent, their suitability and adaptability; and I think there are, in reality, sections in our State in which this type of cattle would fit in admirably—in fact, better, perhaps, than either of the specialized types of purely-beef or purely-dairy animals. If, for ex-

Have you had a
Sleepless Night?
Why don't you take Dr. Cassell's Tablets?
They're just splendid for sleeplessness.
DO THIS.
Take two Dr. Cassell's Tablets to-night at bedtime and note how soundly you sleep how fresh and bright you wake in the morning, how well you feel all day. That test is worth columns of argument; we would not ask you to try it if we were not sure of the result. But we are quite sure.
NOTE THIS FACT:—Dr. Cassell's Tablets don't drug you to sleep. They make you sleep naturally, because they overcome all the nerve-fret and friction that prevent sleep. They nourish the nerve-centres, build up new vitality and fill your whole body with sparkling health. Dr. Cassell's Tablets are the key to vim and vigour.
Free Sample
On receipt of 5 cents to cover mailing and packing, a generous free sample will be sent at once. Address, Harold F. Ritchie and Co., Ltd., 10, McCaul-street, Toronto.
Dr. Ramsay Colles, J.P. of Dublin (Ireland), F.R.S.L., F.R.H.S., etc., says:—"From several cases which have lately come under my notice, I am able to form the opinion that Dr. Cassell's Tablets constitute a safe and reliable family remedy and appear to be specially effective for nerve and bodily weakness."
Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-spasmodic, of proved therapeutic value in all run-down conditions, and the recognised remedy for
NERVOUSNESS, NERVOUS BREAKDOWN, NEURASTHENIA, SLEEPLESSNESS, ANÆMIA, MALNUTRITION, DYSPEPSIA, PALPITATION KIDNEY WEAKNESS.
Specially valuable to Nursing Mothers and Women of Middle Life.
Sold by Druggists and Storekeepers throughout Canada. Prices: One tube, 50 cents; six tubes for the price of five. War Tax, 2 cents per tube extra.
Sole Proprietors: Dr. Cassell's Co., Ltd., Manchester, Eng.

Instant Relief for

Flatulence

Heartburn and Windy Spasms

The efficacy of Dr. Cassell's Instant Relief in these complaints will be a revelation to those who have hitherto trusted to bismuth or soda mixtures, or to old-fashioned liver pills and salts. The trouble is due to gas in the stomach or bowels arising from undigested food, and the natural remedy is to restore the organs to healthy action. Dr. Cassell's Instant Relief does that quickly, surely, and so it effects real cure where the old purgative preparations only weaken the system, and create the pill-taking or salts-taking habit.

Take Dr. Cassell's Instant Relief for constipation, biliousness, torpid liver, sick headache, dizziness, specks before the eyes, flatulence and windy spasms, acidity, heartburn, impure blood, and that dull, heavy feeling which is a sure indication of liver troubles.

Ask for Dr. Cassell's Instant Relief and take no substitute.

Price 50 cents from all Druggists and Storekeepers,

Or direct from the sole agents for Canada, Harold F. Ritchie and Co., Ltd., 10, M'Caul-street, Toronto. War Tax 2 cents extra

THE DUAL PURPOSE COW

(Continued from page 22)

ample, this dual-purpose type of cattle had, years ago, been recommended, instead of the Jersey, to the hill farmers of North Louisiana, where the lack of transportation and marketing facilities, previously alluded to, prevailed, it is the writer's opinion that that section would now be possessed of a much more valuable class of cattle, in every way, than those which are there to be found at the present time, outside of some quite valuable breeding herds of Jerseys, especially. Or, in other words, what the conditions mentioned more particularly call for, is what might be termed "the farmer's cow," that will fill a dual-purpose place, rather than those belonging to the extreme or specialized types.

It should be understood, however, that it is not the writer's intention to minimise, or underrate, the value of any particular breed. Each has it own specific mission to fulfil, and each has its proper sphere. Our aim, at this time, is to try to adapt the most suitable animal to the conditions stated; and it is our conviction that the dual-purpose type, illustrated by the Red Poll and the Devon, should meet those conditions more satisfactorily than the other types. And, as a matter of preference, we believe we would favour the Red Poll on account of its being a hornless breed, and credited with being a somewhat larger milk producer.

One Cent a Word.

Volume 23. SUSSEX, NEW BRUNSWICK, OCTOBER 24, 1916. Number 2.

THE YARMOUTH EXHIBITION

Yarmouth, the gateway of Western Nova Scotia, is annually the scene of one of the best County Exhibitions held in the Mayflower province.

The fair is held under the auspices of the Yarmouth County Agricultural Society whose membership comprise men of more than ordinary intelligence, industry and integrity in their legimitate venture they undertake. The calling.

Men of this class succeed in any The way the Yarmouthonians have stuck together and by friendly rivalry and example have helped each other along is worthy of the emulation of those in some other sections where bigoty, jealousy and lack of stick-to-it-iveness have been the cause for the untimely death or smothered growth of many good movements that had for their aim the bettering of local conditions.

The Yarmouth Exhibiton is purely agricultural and industrial. The limited number of side shows that managed to get a place on the grounds were starved out of the place for want of patronage. The yeomanry of Yarmouth County prefered to stand by the ringside and watch the judges place the awards in the cattle and horse classes or examining the various interesting exhibits in the main building.

That the ownership of a good class of live stock is an incentive for a higher class of citizenship and vica versa are maxims that is now general ly recognized by those who read the signs of the times. A visitor to the Yarmouth Exhibition could not fail to be impressed with the truth of this assertion. There is a lot of good live stock, particularly in the dairy lines in Yarmouth county and exhibitors seemed to take a lot of pride in their cattle and also to their own individual personal appearance all of which helps to give a fair a certain tone that the stranger within the gates cannot fail to notice and be impressed favorably thereby. October 4th to 6th inclusive were the dates of this year's fair during which time the weather man was in good humor and gave a brand of weather that everbody could enjoy.

THE HORSES

The horses were judged by Sherrit Harris of Pictou County. There was only one representative of the Standard Bred class, a mare shown by L. M. Hatfield in the four-year-old class. A brood mare with foal by her side had the earmarks of a thoroughbred if we mistake not. Hackneys were shown by Dr. C. A. Webster and Richard Bain. These were not the flashy kind, but good useful individuals. Clydesdales were few in numbers. The Society's Stallion, Bob McGregor was quartered on the grounds but not shown for competition. The only other Clydes were the mare Spring Fashon shown by H. P. Milestone, which was awarded the female championship and the brood mare Fair Maid with foal by he. side and a one-year-old shown by C. A. Webster, both youngsters by Bob McGregor. Roadsters made a good showing in the four-year-old section. There was very little competition in the other sections of the class.

Carriage horses four years old and over five in number. One-three-year-old three two-year-olds, two one-year olds and one foal of 1916 made up the remainder of the class. The diploma went to W. H. Palmers, yearling. General purpose horses made a good showing. Percheron, Clyde and Hackeney was in evidence.

The light draft horses had six entries in the aged section and in the section for foals of 1916. Five entries in the one-year-old section, three brood mares with foal by their side, two matched teams and single entries in the other sections made up the class. Fred L. Rose showed the best horse any age, a good useful animal byBaron Graham.

The four-year-old and one-year old sections of the heavy draught class were the only sections in which there was any copetition.

Baron Graham colts and fillies showed up well in their various sections in which they were exhibited. We overheard quite a number of farmers bemoaning the fact that they had allowed Baron Graham to be sold out of Yarmouth County. In the foals of 1916 and one-year-olds, some very promising youngsters the get of Bob Mc Gregor were shown.

CATTLE

All classes of beef and dairy cattle were judged by Mr. A. S. Logan, Amherst, N. S.

SHORTHORNS—Dr. I. M. Lovitt was the only exhibitor of Shorthorns and was awarded first prizes in the seven sections in which he had entries.

AYRSHIRES—were conspicious by their absence. A grade cow shown by Adolphus Corning was the nearest representative of that herd.

JERSEYS—There was a big showing of Jerseys. Baring the Gurnseys these were as many Jerseys on the fair grounds as of all other breeds combined. The whole aggregation showed that they were out for business. Cann Bros. were on hand with their magnificent herd, Dr. Lovitt, John C. Corning Adolphus Corning, Chas. Rogers and John L. Cann also showed some splendid females. The number of entries in each class and the list of prize winners will be found elsewhere in this issue. There was strong competition in each and every class of the Jersey grades class all of which showed the value of consistent breeding.

GUERNSEYS—Next to the Jerseys in point of numbers came the Guernseys H. W. Corning had a long string of his prize winners in the ring. W. L. Cook, A. J. Fuller, J. S. Boyd, Alfred C. Murray Crosby, the other exhibitors Servant, Clyde Boyd, Amos A. cook, of pure breds are young men who are starting with a few animals and building up. Mr. Cornings herd is certainly an ideal for these young men to look to and from which they can get assistance in their work.

All sections of the Guernsey grades class were strongly contested.

Holsteins and their grades were very few in numbers. Adolphus Corning and Edwin Porter were the only exhibitors of pure breds.

Hirefords and their grades were shown by Jas. B. Purdy, Webster Burrill, Samuel Burrill and Spenser Burrill.

Polled Angus cattle were exhibited by W. O. Porter.

A few Brown Swiss cattle, the first time they have put in an appearance at Yarmouth, were shown by H. E. Hill and Malcolm McKinnon.

Devons were shown by Wm. A. Pinckney.

WORKING OXEN AND STEERS.

There was a big showing of working oxen. This class comprised, three pairs seven years old, six pairs six years old, two pairs five years old, five pairs four years old and one pair in each of the sections of the younger classes.

The special flag for the best pair of matched oxen, 4 years old and upwards was captured by D. S. Saunders with his low set blocky yoke of white Shorthorn Oxen. This same yoke captured the first prize in the hauling competition and proudly led the live stock parade with their colors flying from their head yoke.

SHEEP

Matthew Lamont of Yarmouth County judged the sheep. There were several nice flocks but not much competition.

THE SWINE

The swine were judged by Mr. S. A. Logan. They were a thrifty looking lot but not so numerous as we would expect to find in such a good dairy section.

POULTRY

There was a good showing of poultry.

The main building was well filled with the exhibits of grains, roots vegetables and dairy products.

Various manufacturing firms doing business in Yarmouth County had well arranged booths at the fair.

The experimental section, Kentville sent a nice display along the lines shown at the provincial fair by the Dominion Department of Agriculture. The live stock division showed their educational exhibit of wool in its various forms and grades in order to give the sheep breeders of Yarmouth County a chance to acquaint themselves with the market requirements for wool

Geo. E. Saunders of the Entomological Laboratory, Annapolis Royal had an interesting exhibit of spraying material for the orchardist and farmer. The resultst of experiments to demonstrate the adhesive qualities of over thirty different spraying mixures were shown. The various sprays had been sprayed on pieces of glass and exposed to wind and weather and photos taken at intervales of eight, fourteen, fifty-seven and eighty-two days during which time at the various dates the rainfall in inches had been .98", 343", 7.34", and 8.94". Some of the sprays showed much better adhesive qualities than others. There were also photos showing the amount of settling at various periods after agigation. Here to there was a great variation which showed that some of the spray materials remain in suspention much better than others. We expect to be able to give our readers full details of these experiments for their guidance in the choice of spraying materials. The first show at Yarmouth excelled the first show at Halifax, which despite the fact that it wsa later in the season speaks well for the fruit growing possibilities of Yarmouth County.

Mr. Jas. Rozee of Yarmouth showed the result of an interesting experiment which he is conducting on the growing of potatoes from the seed balls.

In the spring of 1915 he planted the seed from one potato ball taken from a Green Mountain vine and in the fall he harvested fifty very small potatoes of various shapes that totalled 3 1-2 ounces in weight.

These fifty minature potatoes were planted in the spring of 1916 and this fall he harvested therefrom thirty five pounds of potatoes many of them of excellent type and of marketable size. Mr. Rozee will continue his expirement with the various types thus produced in 1917.

In the Dairy Produce class the the section for best and largest display of table butter made from the milkings of one cow during seven days in Sept. had two entries. The first prize went to Mrs. Edson Foote and the second to Mrs. W. H. McConnell. Mrs. Foots cow gave in seven davs 325 lbs. milk yielding 22 lbs. 14 ozs butter and Mrs. McConnell's cow gave 308 lbs. milk yielding 19 lbs. butter.

THE PRIZE WINNERS.

HORSES

Standard Breds—Mare, 4 years old. —1 entry—1, L. M. Hatfield.

Brood Mare with foal—1 entry—1 Jerry Morton.

Hackneys—Stallion, 3 years old— 1 entry—1, Richard Bain.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

R. D. Robinson Publishing Co., Limited

Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

OCTOBER 24, 1916

DATES OF ISSUE

November ..... 7—21
December ..... 5—19

INTERESTED IN BETTER CATTLE

There seems to be a general tendency to better cattle quality. Everybody is talking "better cattle, better bulls," until the common tail d of the ordinary herds are not in demand. This is the best possible evidence of a general cattle quality improvementthroughout the country When scrubs and culls are not wanted at any price for breeding purposes, there is hope of better cattle and better cattle. As the long as the farmer is satisfied with any kind of an old cow, there is not much evidence of cattle improvement.

The hope of this country, with both beef cattle and dairy cattle in competition with foreign countries, is to forge ahead in quality. The production of the best quality of beef cattle will pay when a poor quality of cattle would be produced at a loss. The same has been repeatedly illustrated in the milch cow population. The cow testing associations have proven that on some farms there are cows that have been kept year after year not paying for the feed they consumed, while others were making their owners a big profit. The intelligence of the cow owner or cattle owner is to be exercised in determining these conditions.

It is an old saying, in relation to such comparisions, "that the best is none too good." It is truly the case when applied to cattle. The cattle owners of the Maritime Provinces must awaken to a realization that they have competition in the matter of butter suqqly, and in order successfully to meet these conditions they must employ better breeding, they must make their land yield larger crops, and develop the beef yielding capacity of their cattle and the butter-fat qualities of their dairy cows. Larger yields of beef in their baby beef classes, and larger yields of milk in their dairy cow classes—this is the logical solution, and it is the only solution that is going to test out.

The spirit is now started in the people. Bulls are wanted, bulls are needed,but they must be bulls of good quality, and this demand is not yet filled. The tendency is now to raise more cattle, better quality of cattle than formerly, and this means disposing of the old bull and buying a better one. This is the most sensible way of accomplishing results.

THE FARMERS STATIONERY

Did you ever see a business house that answered their letters on plain paper? It is probable that you did not, and it is almost, if not, as important that the farmer have printed stationery, as it is for the business house.

Nearly all up-to-date farmers have a special line, it may be some line of live-stock, poultry grains, seeds, or fruits. Therefore, let him make this his special on his letterhead, making mention of some of the most important of his other lines. If he has a name for his farm, which is the case with most up-to-date farms at present, let this occupy a prominent place on his letterhead. However, care must be taken about too much printing on the letterhead, as this sometimes spoils the best effect.

THE MARITIME FARMER is equipped to do this sort of work. Submit your copy to us and have us make you a proof of it. If it suits, the printing may be done, otherwise a change can be made. In a general way the printed letterheads will cost but a trifle more than the same amount of paper in tablet form. It is also important to have the same amount of envelopes printed. Five hundred sheets of paper, with five hundred envelopes to match usually cost in the neighborhood of $2.50, an additional five hundred of each will not cost quite as much as the first five hundred. Your letter always attracts more attention, and is answered in a more business-like way when you have a printed letterhead.—

BURN OLD GRASS AND WEEDS

It has been pretty well established that the last season's grasses and weeds left along the roadsides, fences and out-of-the-way places, where crops were not produced or grazing animals given opportunity to eat, will become the breed ing grounds and winter quarters for many insects injurious to vegetation. Therefore every farmer should join in the effort to exterminate these pests It is a duty that the land owner or resident farmer owes himself, his neighbors and the general public welfare—to destroy these breeding grounds by burning off at the most opportune time for insect destruction.

Some farmers keep a little farm flock of sheep to attend to this kind of work. Where sheep are kept and given an opportunity to graze along such fence lines, roadways or idle grounds, they proceed in advance of the insects and carefully crop off all vegegation so closely that there is no winter protection left for a chinch bug, grasshopper egg or any other kind of insect. This is one of the economical advantages in keeping a few sheep on the farm.

The fall and winter burning of such places—and there are lots of them on all farms where grazing animals are not kept-is a duty that should not be overlooked or neglected. Any time in the winter when the ground is bare and the rubbish dry and easily fired will do, but should not be left later than February. If a systematic observance could be enforced among land owners there would soon be a marked difference in insect pests detrimental to the crop interests.

The time is coming and it is not far aff, when there will be a systematic war waged against all forms of injurious insects and a close observance in the protection of all insect-destroying birds. There must be a law for the enforcement of these demands, and people taught to observe them.

MAKE HIM A PARTENER

"I do not like farm life. It is too hard. I have to work 14 hours in the field and do a lot of chores in the morning and evening. Just as soon as I can I am going to get away from the farm and go into town," remarked a 16-year-old boy to me a short time ago. This boy came from a good home. His parents were very successful, but they were of the kind that believe in all work and no play. The boy was tired and discourged. He had nothing to look forward to. He was not consulted in making the plans for the work. Can you blame this young man for not being interested in farm life? He was used as a machine for production only. If this boy could develop a different view of farming and farm life he would make the most desirable farmer. To develop this view there must be the co-operation of the parents. The boy must be taken into partnership with the farming and the farmer.

RURAL CREDITS

Recurring to the question, "Why cannot the farmer secure his loans at the bank," remarks C. F. Davis of the Colorado Agricultural College, "let us see what kind of a loan he usually requires.

"If it is for the purpose of running through the season until his crop is made, or to hold a crop for favorable market conditions, or to handle stock through the feeding season, the loan may be considered as in the short-term class. If it is to be used for the purchase of land, the supplying of the farm with blooded stock or expensive machinery the loan must be for a longer time.

"Now, the farmer's source of income from which he must repay the loan is limited to his farming operations. Reserving out of the normal returns of his farm the keep of himself and family and a fair amount of upkeep, any remainer that may be left may be safely depended upon to pay off his loan. If he pledges himself to pay more than this he must lower his standard of living, or allow his farm to run down, or, finally, must fail to meet his obligations. . It is, therefore, necessary for the farmer to borrow, on the average, on short term, for a period of not less than one year, and on long term for periods of from ten to fifteen years to periods of twenty-five or even forty years.

"It is important that the money for the loan b easily found and procurable with as little burden of fees for commissions, examination and legal services as possible.

'The greater portion of the money loaned by the banks is money which they hold on deposit and which they must be ready on short notice to return to their depositors if it is called for. It is very evident that they cannot consider the long-term loans above described, and, as they are handling the money of other people, they must exercise the greatest care in the spection of the security offered, thus adding to the expense of the loan.

"Chattel security is of too perishable a nature to permit of being used with a bank loan.

"This brief statement shows, I believe, the principal reasons why the farmers and the banks can not hope to get together in the loan business."

YARMOUTH EXHIBITION PRIZE WINNERS.

(Continued from page 29.)

John C. Corning, 2, Mrs. C. H. Cann.

Best 5 lbs. roll or print butter made by girl under 15—1, Rubie McConnell, 2, Jenette Porter.

Best box summer or fall apples, packed, grown in Yarmouth Co.—1, M. S. Crosby, 2, Freeman Crosby.

PEARS

Best collection of pears, not less than 6 varities named, 5 each—1, J. M. Porter, 2, S. W. Mailing.

GRAPES

Largest collection, varities from cold grapory, 2 bunches each—Claa Caie.

Best collection from cold grapery, not over 6 varities, 2 buncnhes each—1, J. M. Lovitt, 2 Clara Caie.

Best 8 bunches black hamburgs—1, J. M. Lovitt, 2, A. K. Crosby, 3, Clara Caie.

Best 3 bunches white—1, Clara Caie, 2, J. M. Lovitt, 3, A. K. Crosby.

Best 3 bunches red—1, Clara Caie, 2, A. K. Crosby.

Best 3 bunches, black allicants—1, J. M. Lovitt, 2, Clara Caie.

CRANBERRIES

Best pk. large or ovall—1, Fred K. Whitehouse, 2, Mrs. W. Hemeon, 3, A. K. Crosby.

Best pk. upland—1, Mrs. W. Hameon, 2, Ethel Handy.

Best pk. small red—1, Pearly B. Porter.

Best pk. spice or grey—1, Pearley D. Porter.

Judges, H. W. Osborne and R. G. Whitman.

Special prize for best booth and exhibit not otherwise provided for—1, Robin Hood Flour, representing Parker Eakins and Co.

1, R. K. Smith, Wall Paper. 2, Porter and Robins, Shoes, 2, R. H. Davis ,Bookbinding.

CONTENTS OF SILO

Please tell me how many tons of silage in the last 13 feet of a 11 x 30 ft. silo.

Also how many cubic feet of hay in the mow to a ton, and the weight of a cubic foot of potatoes in the bin.

O. B.

The last 13 feet of silage in a silo 11 x 30 feet will weigh approximately 30 tons.

The weight of a cubic foot of hay or the number of cubic feet of hay per ton will depend somewhat upon the kind of hay as well as its condition when put into the mow and the way it is packed. Loose hay will of course weighless and that which is thoroughly dry before being stored will not pack as well as that which is a little green. According to Woll, 450 cubic feet per ton is a fair average for hay in general. He gives 420 cubic feet for a ton of timothy hay and 500 cubic feet for clover hay.

Potatoes in the bin should weigh about 48.18 pounds per cubic foot.

TO TIE THE TREE

A small fruit trees that persist in leaning toward the east caused by the prevailance of west winds have to be looked after during the early years of fruit or else they will always be leaning.

We have found that a strip of an auto tire or an old bicycle tire and a stake set a foot or so to the westward of the small tree will hold the tree up where it belongs and not injur the trunk in any way.

A wire or strip of iron would hold the tree as well but there is the trouble about cutting into the bark as the tree grows and injures the trunk permanently. An advantage of the rubber tire is that they will give a little when the wind blows too hard and so hold the tree easier than an inflexible fastening would do.—R.E.R.

Candle the eggs carefully if you expect to set them. Too often they are shaken about and handled roughly, and this last of itself may be the sole cause of their failure to hatch. Eggs are often cracked slightly and the crack will not show. These will always break under the hen.

In many small communities the remedy for a poor market for fat hogs and other classes of finished live stock consists in producing four times as many. Buyers are attracted to places where carlots can be bought often. Community specialization is the gospel.

Is it Fair?

BELGIUM entered this war because she would not sell her honor to an overwhelmingly powerful neighbor. Britain and Canada took up arms in defense of treaty obligations and simple justice. The Belgian motive is as noble and unselfish as our own.

Belgian troops are holding the line side by side with our own gallant lads, braving equal dangers—bearing equal hardships—strafing the common enemy.

But there the equality ends! We non-combatant Canadians are living in a land of plenty—well-fed, lacking no necessity, and indulging in many luxuries.

The Belgian mothers and children in millions are eking out a pitiable existence on the daily ration of three slices of bread and a pint of soup supplied by the Belgian Relief Commission.

Is it fair?

Are we justified, before the bar of common humanity, in calmly feasting ourselves while they endure near-starvation?

What have YOU done to relieve them?

$2.50 will feed a Belgian family a month! The average Canadian family would scarcely miss this sum. You yourself could probably spare several times this much monthly—feed several Belgian families—and be none the worse off.

Will you do it?

Send your subscription weekly, monthly or in one lump sum to Local or Provincial Committees, or

HORTICULTURE.

THE OLD APPLE TREE

More and more as time passes, am I convinced that we must stop leaning and rely on our own eyesight, hearing and thinking. Science can do much, but the real test must be found in experience.

For nine seasons I have been trying to find out what certain trees wanted, for, while the great majority came back readily on the treatment given, certain few refused, and these have kept me busy. Somehow I did not want to be beaten by an apple tree, and so have kept at it, trying to find the treatment which suited the needs of the individual tree. Of one thing I am satisfied, that we must take into account this matter of individuality. You cannot treat trees in a bunch, all alike, and expect the best results. Of that I am satisfied. The best evidence to be found is that which the trees furnish, and by that my work must stand. In general, I am satisfied at the condition of those old trees thought practically worthless nine years ago, their growth, evidence of good health, large leavees, and amount and character of fruit.

Certain ones have refused to respond, and these have furnished good food for thought all these years. One in particular, and it is about that I want to tell, for to me it carries a lesson not to be overlooked This is a Rhode Island Greening tree standing alone in the field, in grass. In 1909 it was given a fair dose of Fisher Formula fertilizer. In '10 it was plowed about and cultivated, and also in '11 and '12, when tthe field was seeded down. In '13, '14 and '15 I gave it a good treatment with different combinations of chemicals—12 pounds yearly—but the tree persisted in throwing out small, pale leaves, making a couple of inches growth, and yielding about a barrel of apples yearly. Realizing that I was not getting hold of it, for its own good and giving it what it craved, yearly changes were made in food and treatment.

In August, 1915, I determined to try mulching, and gave it a foot or more of second crop, extending well out beyond the drip of the branches This spring I gave it another dose of the same, and fortunately hit on what the tree neded, for it is a pretty picture today with its wealth of large, strong leaves, its foot or more of new growth, the evidence of coming vigor and the three barrels or more of fruit ripening on its branches. Only by the actual test could I have known that it was the mulch which that individual tree wanted in order for it to jump into active work for my profit. All this time there are other trees which do not respond to mulching as well as to applications of fertilizer, forcing the lesson that for success, one must be looking after the individual needs of individual trees. Profoundly have I been impressed with this fact during the years, and every experiment trengthens the conviction.

I like also to think this is so, for to me it supplies the incentive for activity, as no man will want to acknowledge himself beaten by an apple tree. So much enters into this question of soil conditions, character of subsoil. etc., that to know all these things one needs to have actual touch come into real knowledge of what with his land and by experience to do.

During the years a wealth of advice has been showered upon me, and every theorist has known just what was necessary to restore, but unfortunately these good men knew nothing about that tree and their advice was worthless. Not one has ever suggested mulching, though several have been outspoken against it, citing the bulletins sent by our Station, in which the mulch system was decried. All the while that tree was crying for protection by mulching, and I did not know enough to understand its call. When I did, the tree responded. All this, if it suggests anything, forces the lesson of greater watchfulness on the part of each and every grower, and varying tests withindividual trees to ascertain what each one wants, in order for it to thrive. Of one thing I am convinced, that the trees are ready to do their best when we are alive to our opportunities and do our duty.

The time has come when we must seek for increased crop yield per tree, per year, and to insure this, closer study must be made of the wants of each tree and the supplying of the same. The average in Maine, if not all New England, is less than one barrel per tree yearly, where it might easily be two barrels.

Dr. G. M. Twitchell.

WANTS RELIEF

It is high time that something is done to prevent the reckless sale of nursery stock not true to name, have had several apples from that bag myself. I have not had much of an opportunity to consider this matter, but think some penalty equal to two or three times the purchase price would tend to make these people more careful. I doubt if a more stringent law could be passed at the present time.—F. C. Bancroft, Master Delaware Grange.

APPLES

Owing to the extreme prevalence of apple scab this season, there are many growers who intend to pack "special" No. 3 apples in order to distinguish such packs from the ordinary run of No. 3. Such grade marks will enable consumers to purchase sound fruit with only slight blemishes, at a comparatively low figure and will also enable the grower to net larger returns than he would receive for barrels marked only "No. 3." As a matter of fact, the fewer packages of No. 3 apples that reach the market, the more satisfactory will the fruit season be to all concerned.

There is no demand for "trash," a term most aptly applied to fruit often packed under the grade No. 3. Such fruit should never be packed at all, but should be sent to the evaporator or cider press. The grade "No. 3" has, unfortunately, become so common, and is so generally supposed to indicate inferior fruit, that the wisdom of adopting distinguishing marks for superior grades of No. 3 at once becomes apparent. Such terms as "Good No. 3," "Large No. 3," or "Special No. 3," provided the contents of packages so marked are honestly put up, are not contrary to the requirements of the Fruit Marks Act. The packing of inferior fruit or "trash" under such marks is, of course, against the law.

One word regarding the packing of apples in general. Growers must bear in mind the fact that Government fruit inspectors cannot be less severe, on account of a "bad year." The requirements of the Fruit Marks Act do not vary from year to year. Consequently apple packers should be careful to brand all packages with regard only to the quality of the fruit therein.

PACKING THE APPLE IN NEW BRUNSWICK

By A. C. Turney

A large portion of the New Brunswick apple crop is marketed in open barrels. The fruit is picked into baskets, emptied loosely into barrels in the orchard, and then stored in bins in the cellar, and afterwards placed on the local market, a few barrels at a time, unheaded. However, a considerable amount of early and late fall apples and some winter varieties are exported or shipped such distances within the province as to render good tight packing absolutely essential. The materials used and general method of procedure is as follows:

The Barrel and Its Preparation

The minimum size of a standard barrel containing 96 quarts, and made from 28-inch staves, commonly known as the Nova Scotia barrel, is used here. The dimensions of such a barrel as given in the Inspection and Sale Act, are as follows:—Between heads, 26½ inches inside measurement; head diameter, 17 inches inside measurement; middle diameter, 18½ inches inside measurement.

The hoops are made of birch or alder and are often split. The split hoops while lacking in neatness are cheaper and usually stronger. To prepare the barrel for filling, drive the quarter hoops down firmly and securely nail the face end. This is done by driving nails obliquely through the upper hoop, the end of the stave, and into each corner of each piece of the head. An additional nail or sometimes two, should be driven into the side pieces. In driving these nails, start them as low down on the end hoop as is possible, but do not let them come through the head. Use five penny nails for this purpose. Head liners are hardly used here at all, although they should be more generally used. They make the barrel safer and stronger and are really essential for export trade. Two liners over the ends of the pieces forming the head should be used, driving four to six nails through each one and clinching them on the outside of the barrel. Secure the quarter hoops by driving two nails, one on each side of the barrel, in a slanting direction, clinching them on the inside. If the hoops are split, drive an extra nail through the lock or lap of the hoop. Use three-penny nails for securing these hoops and for liners.

Facing

Place the barrel on a good stout plank and put in one of the heavy heads commonly used for this purpose. This gives a neater appearance to the barrel when opened and keeps the face apples cleaner and brighter. The face layer should be representative in size, color and freedom of blemish of the entire package. If it fails to do this, then the pack is dishonest and dishonest packing has thrown hundreds of thousands of apple trees into neglect and decay. Why? Because it doesn't pay. With a stemmer, cut off the stems of all the apples for the

Safety First
Every Farmer, Every Owner of Horses Should Use
RED TIP HORSESHOE CALKS
during the Winter Season.
Whether your horse is a light roadster or a heavy draught horse there is a calk made especially to fit his requirements. When worn down RED TIP HORSESHOE CALKS can be removed and a new set inserted in twenty minutes.
They will not break off and instead of becoming dull will wear sharper with use. By this method your horse is always sharp shod and you eliminate all the danger and worry of Winter travel.
RED TIP HORSESHOE CALKS are cheap, easy to get, easy to put on and will absolutely hold up any horse on any pavement or road, no matter how slippery. They will save time, money and annoyance.
Go to your horseshoer today and have your horse fitted with RED TIP HORSESHOE CALKS and remember that genuine NEVERSLIP HORSESHOE CALKS ALWAYS HAVE RED TIPS.
Send for Booklet 398 which will tell you all about them
NEVERSLIP MANUFACTURING CO.
NEW BRUNSWICK, N. J.

face layer and place them in position, stem end down, in a series of circles starting at the outside and working to the centre. Get the layer firm and uniform, being sure never to use a noticeably smaller or larger apple just because it will make the layer tight.

Filling and Packing

The barrel is now faced and after carefully placing apples so as to cover the open spaces in the face layer, it may be filled by emptying the apples in very carefully from the basket. As each basket or two baskets of apples are placed in the barrel, grasp the barrel firmly at the top and raise just one edge and then the other, see-saw fashion, about two inches from the plank on which it is setting, allowing the barrel to drop back each time sharply but not loosely or violently. A barrel should be racked at least three or four times during the filling. When filled to about two inches from the chime the barrel is ready for tailing and is prepared for this by using a barrel "follower," which consists of a round piece of plank, smaller than the head of a barrel so that it will fit nicely inside and padded on the underside with felt. This is placed on the apples and held firmly when giving the last rack to the barrel and leaves a fairly even surface on which to arrange the top rows, or "tail up," as it is commonly spoken of.

Tailing

This is the most difficult part in the packing of a barrel of apples, and is often only half done or omitted to save time. The object is to arrange the last two rows of apples as firmly as possible and in such a way that when the head is placed on it will touch every apple evenly, distributing the pressure over the whole of the layer and transmitting it evenly down through the barrel. The apples of this last layer should be placed stem end up, the stems being shortened as in the face layer, and should bring the surface of the fruit level with or slightly above the top of the stave, depending considerably on the variety to be packed and the distance to be shipped. Tender skinned varieties such as the McIntosh Red and Northern Spy should not be filled more than level with the top of the barrel and perhaps even less for comparatively local markets. On the other hand, solid, tough skinned varieties like the Ben Davis and Golden Russett should be tailed higher, as they need more pressure to prevent slacking in export shipping, probably about an inch above the top of barrel for export and less for local markets.

Heading

Remove the upper hoop of the barrel and loosen the next one; lay the head in position, catch the screw press under the barrel and arrange the circular press head in position. Everything is now ready for applying the pressure, except that the top hoop should be slipped on loosely, so that after the head has been pressed down into the chime, the hoop may be driven into place without removing the press, but first driving the second hoop down into place. Nail the head in the same manner as in the face end, using liners. Stencil the face end and then lay the barrel on its side. If packing in the orchard, remove the packed barrels to some place of shelter where they will be cool but not subject to freezing temperature, and under no conditions allow them to be on the ground in the orchard or to be exposed to rains.

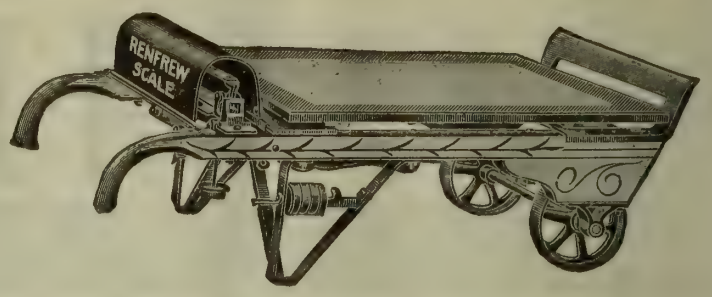
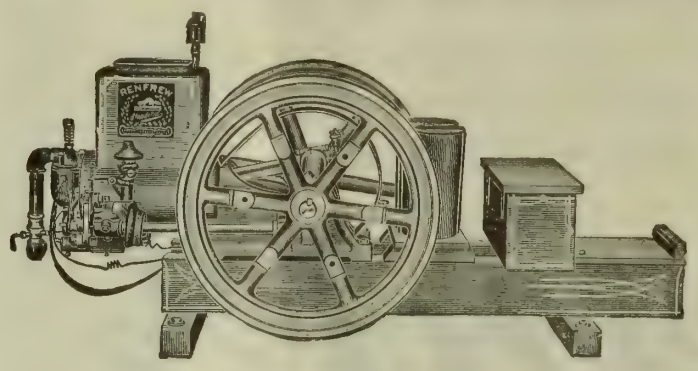
Renfrew Standard ---Truly Reliable

You can absolutely rely on the accuracy of the Renfrew Truck Scale. Each one is tested by the Government, and a Government inspector's certificate is attached to each scale. There is practically nothing to wear out or get out of order, so that you can depend on the scale to keep weighing accurately for years. You can weigh anything on the Renfrew Truck Scale from one pound to two thousand, whether small or large, alive or dead. Wheels around like a truck. The handiest scale for farm use. Every farmer needs one. Write for scale booklet.





The Renfrew Standard Gasoline Engine starts without cranking. Has both batteries and high tension magneto. Can be as closely regulated as a steam engine. Has a carburetor that saves gasoline. Built extra large and strong. All styles from 1½ h.p. to 60 h.p. Write for engine catalog.

The Standard Cream Separator has increased the cream profits of thousands of Canadian dairymen. It skims to .01 per cent., and gives cream with the butter fat globules unbroken—cream that makes high-class, firm butter. It turns easily, the gears all running in a bath of oil. Its interchangeable capacity enables the size of the bowl and discs to be changed and the capacity increased or decreased at any time without purchasing an entirely new machine. This is a feature that is appreciated by dairymen, who increase the size of their herds from time to time. This feature and others are explained fully in our Separator Catalog. Write for a copy.

DAIRYING.

EFFECT OF BACTERIA IN MILK

Bacteria are minute living things possessing some characteristics of both plants and animals. Some of them have the power of moving when in water. Otherwise they resemble plants. There are various kinds of bacteria, some of which cause diseases in both plants and animals, the action of others results in decay, putrefaction, and fermentation. Some are harmless, while others are distinctly beneficial. Each disease, whether of animals or plants and other organic changes of similar specific organism which begins its work as soon as favorable conditions appear.

The bacteria which cause the changes in milk may be divided principally into two groups, viz.:

1. Those causing the souring of milk.
2. Those causing sweet curdling.

Other bacterial changes do occur, resulting in the formation of blue, red, bitter, and ropy milk but such conditions are not common. Each of these changes is effected by a different organism, but it is seldom that they find conditions in the milk suitable for their growth.

The lactic acid bacteria, causing the souring of milk, are by far the most common, and are responsible for most of the losses occurring in milk and cream.

Milk provides a particularly favorable medium for the growth of these bacteria. No matter what other bacteria are present, they are almost sure to make their appearance and to cause changes that make conditions unfavorable for the growth of other organisms. This explains why bitter, red or blue milk is seldom seen, as even though the milk may not be sour there is sufficient acid present to prevent the development of other forms of bacteria.

The lactic acid bacteria increase most rapidly when milk is at a temperature of 70 degrees. The results of experiments show that in milk kept at 50 degrees the bacteria increases in number five times in twenty-four hours, whereas at a temperature of 70 degrees the increase was seven hundred and fifty fold. Sometimes it has been found possible to keep milk for two weeks or more without becoming noticeably injured by bacteria when maintained at a temperature of 50 degrees. If kept at a lower temperature the milk will keep still longer. This, of course, is seldom possible on the farm. The value of these facts is patent to all. They show that the maintenance of a low temperature is a most essential factor in the keeping of milk. The same precaution should be taken with cream. Sweet cream always commands a higher price than sour cream at creameries where the cream is graded.

The most practical and feasible method of controlling the bacterial development in milk or cream is to prevent the entrance of the germs into it. To do this, requires that precautions be taken in every operation connected with the production of the milk.

Sourses of Bacteria in Milk

The milk secreted by the milk glands of healthy cows contains no bacteria, but that drawn from the cow's udder is seldom entirely free from them. It has been demonstrated that bacteria may enter the udder through the teats and spread through the milk ducts. Most of them, however, will be found in the teat itself. For this reason, it is advisable to milk the first few draws on the ground.

Air in the Stable

All air contains germs, but that in the stable shows marked increase in germ content over the air outside. On this account, milk drawn outside is generally purer than that milked inside. It is important, then, that the dust should not be stirred up in the stable at milking time, otherwise, a large number of bacteria may find their way into the milk. The walls, floors, and ceilings should be kept as clean as possible at all times in an endeavor to keep the air pure.

The Cow

The small straws, particles of manure, and hair are all sources of contamination when they get into the milk. The solid particles that fall into the milk all act as carriers of germs, and the greater the amount of dirt, the less satisfactory are the keeping

THE CANADIAN SALT CO. LIMITED 179

qualities of the milk. Wiping the flanks and udder of the cow with a damp cloth just before milking will reduce the possibility of contamination from the source to a minimum.

The Milker

The hands and clothing of the milker are frequent sources of contamination. The hands should always be washed and the clothing kept as clean as possible. A white duck carpenter's apron, with a bib attached, to wear while milking, will aid materially in keeping the milk clean.

Milking with wet hands should never be allowed, as the germs which may be present on the teats of the cow and the hands of the milker, are more readily washed into the pail.

The Utensils

The thorough cleansing of the milk pails is a very important matter. They should be washed first with warm water and then thoroughly scalded with boiling water. To make the work of washing more easy, it is advisable to use seamless pails in which the bottom is rounded nicely into the sides. This avoids crevices in which bacteria might lodge.

Milk should always be strained through several thicknesses of cheesecloth. If a thin layer of absorbent cotton is placed between the folds, practically every particle of dirt and many of the bacteria will be taken out of the milk. The ordinary wire strainer is of little use, as the fine particles of dirt are easily washed through.

THE CREAMING ABILITY OF MILK

The percentage of fat does not entirely determine the creaming ability of milk, according to the Iowa Agricultural College. A summary of the results of an investigation conducted by this institution follows:

1. Wide variations exist in the creaming ability of various lots of milk and accordingly in the cream equivalents of 1 per cent. fat.

2. The individuality of the animal is an important factor from the standpoint of the creaming ability of milk.

3. Factors, such as the stage of lactation of the animal and the breed, are of important from the standpoint of the creaming ability of milk.

4. The temperature at which milk is held influences very materially the depth of the cream layer thrown up. low temperatures giving deeper cream layers than high temperatures. For the development of a deep cream layer on milk, the milk should be held at as low a temperature as possible, although this temperature should be above the freezing point of milk.

5. At ice water temperature, in general, a deep cream layer is first formed and this gradually contracts as the milk stands. At room temperature, in general, a shallow cream layer is first formed and this increases as the milk stands. Commonly a definite cream layer is evident at room temperature earlier than at ice water temperature.

6. With the milk from individual animals, low temperatures occasionally prevent the development of a definite cream layer.

7. The original temperature ordinarily has little influence on the creaming ability of milk.

8. Continued creaming tends to decrease the creaming ability of milk, although occasionally increases are observed. Continued creaming also decreases the distinctness of the cream layer.

9. Agitation at ordinary temperatures does not seriously decrease the creaming ability of milk and occasionally there is a slight increase.

10. Clarification consistently causes a slight decrease in the creaming ability of milk, but this decrease is too small to be of any practical importance.

11. Running milk through a separator and then mixing the cream and skim-milk commonly causes a slight decrease in the depth of the cream layer developing on milk; the rate of the rising of the cream is also decreased. Wide variations are, however, encountered in the effect of separation on milk.

12. Viscogen comonly increases the depth of the cream layer on milk and sometimes this increase is an enormous one; wide variations are, however, evident in the effect of a certain amount of viscogen. The use of visocgen to improve the creaming ability of milk can not be considered a legitimate method of increasing the depth of the cream layer.

13. The addition of egg white commonly causes a slight decrease in the depth of the cream layer.

14. A change in temperature influences the depth of the cream layer on creamed milk. With bottles, a decrease in temperature increases the depth of the cream layer and an increase in temperature decreases it. With tubes, a decrease in temperature causes only a slight decrease which may be due simply to continued holding.

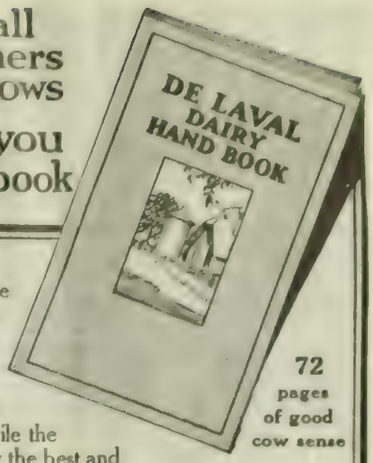
15. In general, efficient pasteurization decreases the cream layer of milk. This decrease need not be a serious one if the pasteurization is properly carried out and the milk is properly held after pasteurization.

16. Homogenized milk does not give a definite cream layer.

17. Wide variations in the effect of the various factors on the creaming ability of milk are observed and are undoubtedly due, in part, at least, to differences in the milk used.

FREE to all owners of cows

If you keep cows you ought to write for this book



72 pages of good cow sense

THIS book was written for the man with only two cows just as much as for the man with twenty. In it has been gathered together a great fund of valuable information on subjects which are of vital interest to every cow owner. And while the various phases of dairying are treated by the best and highest authorities, it is not a technical treatise but is written in plain every-day language so that even the children can understand it.

Here are just a few topics that will give you an idea of the practical nature of its contents:

"How a Dairyman Made Good"— a real story of a real farmer, who starting with almost nothing, built up a fine dairy herd and made a big success.

"Year-Round Feeding of Dairy Cows"—by an authority whose advice is well worth heeding. The importance of proper feeding deserves more attention from every cow owner.

"How to Judge a Dairy Cow."— shows by illustrations what points to look for in a dairy producer—explains the essential qualifications of a good dairy cow.

"Building Up a Dairy Herd"— a practical breeder gives some sound advice on this important subject.

"The Farm that Won't Wear Out" —shows that the farm where cows are kept, and the fertility returned to the soil, improves instead of deteriorates.

"The Care of Cream on the Farm" —quality is as important as quantity. It costs little and brings big returns.

"Silos and Silage"— one of the best chapters in the book. Full of silage facts that every farmer ought to know.

Then there are splendid articles on "Ventilation of Dairy Barns," "Breeds of Dairy Cattle," "Legumes for the Dairy," "Care of Freshening Cows," "How to Test Cows," etc. Numerous dairy rations, suitable for various sections of the Dominion, are given, and various milk and dairy tables as well as tables of weights and measures, silo capacities, etc. that every farmer has occasion, at some time or other, to refer to.

Thousands of dollars have been spent in the preparation of this book, and if you keep cows you certainly ought to write for a copy and read it from cover to cover. The book is absolutely free. Just fill out the coupon or send the information requested on a post card, mentioning this paper.

THE TAMWORTHS AS DAIRY HOGS

A great deal has been said about the different breeds of hogs, and many breeds have started from the black and white hogs, yet it is not the history of the past that concerns us most, it is the present inquiry and the future prospects.

Hogs, like kings and queens and tribes, seem to have their day. Where they were once famous and their product sought for, other breeds have come that have more than supplanted their predecessors. Where any one breed has been tolerated to excess their meat has become of secondary quality. As a rule, among breeders, it is a hog, plump, with fancy points and appearance, not the sweetest, purest and most healthful meat formers such as the stomach of the consumer most desires that meets with approval. To meet the required demand now, you want a hog with length and depth, large and full in the ham. Their disposition and mode of life seem to give them the right to grow and form muscle rather than fat. They possess great nerve and action, with good feeding qualities, and make them good rustlers for themselves, and with strong constitution and hardiness they build a firm and solid carcass that is less subject to disease than the fat hog. Their physical development also fits them as large reproducers with a rich flow of milk; as can be seen by the thrift of their young, and where this breed of hogs has prevailed, the meats have raised in quality and price.

In this part of Canada it is less than 20 years since Tamworths were first introduced and people that only a few years ago looked on them only to criticize, are today their most ardent admirers. Also notice the improvement they have made on the Canadian meats, they go to the most critical and fastidious class of customers, the great middle class and the aristocratic Englishmen. The quality, finish, flavor and appearance of our product must be just right or they would spend their money elsewhere.

We find that nothing removes prejudice so quick as the mighty dollar, and this is true of the Tamworths. We also find the fashion of taste changes as well as the fashion of ware, and it is a matter of importance that our supplies should be what the demand most calls for.

We often hear it said "that if the packers will not give more for dairy fed hogs or for Tamworths than for other breeds of swine, there is nothing gained by raising them."

And after experimenting with them in many ways for sixteen years, I am fully convinced that on the farm, the Tamworth is a most profitable hog. He will transform cheap farm products into high-priced bacon at a great profit. He will grow and do well on clover, grass, stock beets, or peas, all of which are the cheap farm products, and he will also do well when fed on high-priced feed like corn, ship stuff and oats.

Tamworth swine certainly have some splendid qualities. They have stamina and vigor that would be the envy of all the weak races of light-limbed and gouty stock. They have a magnificent frame, viewed from the standpoint of ruggedness. They are seldom troubled with rheumatism, or gout, or paralysis of the limbs or breaking down in the legs. They have limbs that can carry them to the pastures, through the same and home again without labored effort. They are proverbial for large litters and no less famous are they for the way in which they rear them. The young litters have strength and action that enable them to fight an easy battle for existence from the first if they are given half a chance. As many pigs will be reared by one-third less the number of Tamworth sows than from sows of several other breeds, and they will be reared in better form.

Tamworths are also useful crossing on other hogs, and the longer the period that such sows and their ancestors have been tied too closely to a corn diet, the greater the renovation which such crosses will work. The progeny from these crosses will inherit strength and vigor and prolificacy that will agreeably surprise the men who are so discerning as to make such crosses.

But one of the best qualities of Tamworths is the ability they have to produce the finest quality of pork. Because of the intermingling of the fat and lean on the side, they make the best of bacon. Their shoulders and hams are not so overlaid with fat that has to be thrown away as with many breeds. Farmers who once grow Tamworths to provide their own pork will want to grow them again.

True, they will not mature quite so early as some breeds, and possibly they may require more food to feed them. But they they do, see what there is to offset the same. Against this one item there would be the items of stamina, prolificacy, value in crossing, and the magnificent quality of the pork which they produce. Nor has it yet been proved conclusively that Tamworths are harder to fed than other races of pigs, though to some little extent this may be so. Some peculiarities of form would seem to give countenance to the idea, but as yet on this matter judgment should be held in suspense.—J. A. MacDonald in Kimball's Dairy Farmer.

RINGING PIGS

We are not of those who recommend that all pigs should be rung from the time they are weaned; indeed, there seems no reason why the ringing should not be deferred until the necessity for it arises. Many pig-keepers ring stores and breeding sows as a measure of prevention; but there is generally some warning or indication of a disposition to root, and then the restraint should be promptly applied. It is not desirable, however, to ring sows that are heavy in pig, as rough handling and resistance to the operation may prove injurious and occasion abortion. Ringing has a taming effect, and a vicious old boar is rendered more amenable by it. As regards the

CONSTIPATION the bane of Life

Such torturing headaches, such hopeless fits of depression poor complexions poor general health—is the lot of the sufferer from Constipation All absolutely needless. Knowing what Chamberlain's Tablets have done for thousands who suffered from Constipation, Indigestion Headaches, etc., we earnestly counsel you to start them to-day if you are a sufferer.

You hardly realize you are taking medicine their action is so gentle—but sure. The liver acts vigorously The bowels respond regularly Your digestion becomes normal. Your blood is very soon toned and purified

Get and keep Chamberlain's Tablets handy. All druggists, 25c., or by mail from Chamberlain Medicine Co., Toronto 19

CHAMBERLAIN'S TABLETS

The Importance of the Roof

A roof should be so good that once laid you can forget all about it. You can do this with a Paroid Roof. Once you and your farm-help have laid Paroid according to the simple instructions, your roof is weather-proof and fire-resisting.

NEPONSET Paroid ROOFING

Paroid is waterproof, because it is saturated through and through with asphalt. It has not dried out, curled up, split or cracked in 18 years' strenuous trials. It positively resists fire. Insist on the genuine—Paroid Roofing.

Look for the Paroid roll, and you will find one of the 2,000 Neponset dealers throughout Canada.

Paroid is made in 3 colors—Grey, Red and Green.

Write for useful book, "Repairing and Building"—sent upon request—FREE.

Try Neponset Wall Board in place of lumber, or laths and plaster—you'll like it.

alleged cruelty of the practise there are circumstances under which ringing is a necessity, having regard to the well-being of the animal, or rendering it safe or more useful in the service of man. Further, the operation, if skilfully performed, and with proper tools, is not very protracted, and probably not particularly painful. In dealing with pigs, the pain actually caused must not be measured by the resistance offered or the protests uttered. These are always loud, and a pig will make as much noise about taking a dose of castor oil as having his nose slit; but there is cruelty where there is neglect to attend to any soreness caused. When pigs have been rung they should be watched, and if the snouts get sore the rings should be taken out. Festered noses, about which pigmen often trouble very little, are not uncommon, and so generally arise either through the rings being clumsily inserted or put in too deep, or through an accumulation of foodstuff around them. If inserted too far forward, that is, too close to the rim of the snout, it may be torn out; or if placed too far back, that is, into the flesh and too near the nasal bone, it will be too painful and probably suppuration, and perhaps gangrene, will result. When pigs are fed on boiled or steamed potatoes, or any sticky food, it will often accumulate round the rings, form a hard lump, and cause soreness. A cure for this is to turn a few peas into a trough of water, when the pig is searching for, and securing the peas, the accumulation gets soaked and rubbed off.

FREE VETERINARY ADVICE

Posterior Paralysis

F. H. S.—Many of a litter of pigs two and a half months old are losing the use of their hind quarters; in other respects they are apparently all right, in good flesh and anxious for food. They have been fed upon corn on the cob and skimmed milk.

This condition is usually brought about by a too liberal diet of corn, as in this case. Take away all rich grain feed, giving nothing but bran, slop, milk, etc., put them in clean, well-aired quarters with plenty of room to move about. Give each once every two or three days a tablespoonful of epsom salts, or about that amount; more if necessary to keep the bowels loose. Use great care in getting them back on a rich ration.

Rheumatism

Subscriber has a lot of shotes weighing from 50 to 100 pounds that are very lame and sore, especially in the legs; they hate to move and squeal with pain when touched.

The symptoms would indicate acute rheumatism, and I would advise the following treatment: Mix with feed an ounce or two of epsom salts for each pig once a day until bowels are loose, then give each a half dram of salicylate of soda three times a day. Feed foods that will keep bowels free, and house in warm, dry quarters. Any tendency toward constipation should be combatted with a dose of salts.

L. M. N. S. has a 4-months-old pig that presents symptoms identical with the shotes above. The medical and other treatment will be just the same as given in the case mentioned.

COOKING ROOTS FOR PIGS

Whether it is wise to cook roots for pigs depends to some extent on the facilities which exist for cooking, and still more on the age of the pigs to be fed. It is never advisable to give young pigs a lot of cold food in winter. Swedes are generally fed in the winter season; they are watery, cold, and in severe weather often frozen, and it is not good to make the pigs warm up this cold water to the temperature of the stomach, since it impairs the digestive functions. This is especially the case with young pigs. In the ordinary way, especially now that both coal and labour are dear, cooking for pigs is not a profitable business, but where the circumstances are exceptional, as where the are a lot of pigs to be catered for, and a proper cooking plant or waste steam is available, it probably does pay to provide warm food, particularly when the pigs are young and the weather is cold and wet. Old sows can at all times deal fairly well with raw roots, but little pigs in winter ought not to be fed with them. An alternative plan to cooking is to pulp the swedes finely and mix them with the meal at least twenty-four hours before they are given, allowing the heap to stand in the warmest place available. When used in this way they are as easily digested and as nourishing as when cooked.—Veteran.

Feed your hogs at regular intervals. The pig's stomach is a good alarm clock to go by.

LOUDEN Roller Bearing Litter Carriers

—make quick, easy work of stable cleaning. No bother with brakes or ratchets. Loads easily elevated; a light pull on hand chain does it. Box loaded or empty will stand at any height. Roller bearing track wheels give ease and steadiness of motion on the track. Heavy galvanized steel box carries a big load.

COULD NOT SLEEP

Nerves Were So Bad.

To the thousands of people who are tossing on sleepless beds night after night, and to whose eyes sleep will not come, Milburn's Heart and Nerve Pills offer the blessing of sound, refreshing slumber, because they restore the equilibrium of the deranged nerve centres, thus restoring strength and vitality to the whole system.

Mr. Arthur McCutcheon, Mt. Pisgah, N.B., writes: "I have been much troubled with my nerves, and could not sleep for hours after I would go to bed. I would toss and turn from one side to the other before I could go to sleep. I would then wake up in the night, and lie awake a long time before I would get to sleep again. I thought I would try Milburn's Heart and Nerve Pills, as they were recommended so highly. I now get to sleep without any trouble; my nerves seem quieted, and when I lie down I go to sleep quickly. Anyone who is bothered with their nerves should keep a box on hand."

Milburn's Heart and Nerve Pills are 50 cents per box, 3 boxes for $1.25; at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THE HORSE

POLL EVIL IS A FISTULOUS SORE

It Is Caused by an Accident or Rough Treatment, and Is a Dangerous Malady in Horses

"I have a horse that has got a running sore behind the ears."—Subscriber.

This is a fistulous sore affecting the bones of the neck near the top of the head or poll. It is caused by striking the top of the head against a low ceiling or doorway. Suppuration sets in; the pus breaks out on the top, like any other abscess, but burrows down into the bones at the same time, differing in this respect from an ordinary abscess, so that, within a few days after bursting, it has burrowed down so as to reach the bone. If neglected the case becomes serious and the horse will be rendered useless. As in the treatment of all fistulous sores the cavity holding the pus must be opened at the lower end so that the pus may run out. Inject carbolic lotion twice a day, viz., 1 part carbolic acid to 20 parts water. Linseed poultice applied hot and soft till the holes are filled up and healthy looking; then apply three times a day sulphate of zinc 6 drachms, sugar of lead 1 ounce, water 1 pint. Mix and shake. If the symptoms of drooping ears appear, which shows the second and dangerous stage, you will have to get skilled aid. To be successful, you must act quickly and constantly, as it is always a very difficult case to cure.

HORSE BREEDING IN HUNGARY

Hungary, into the fertile plains of which it appears likely that the Russian troops will soon force an entry, is celebrated for its breed of horses. One of the best known breeding establishments is the State stud farm at Kisber, conducted by the Government, where horses are bred for home requirements and for export.

The State studs contribute amongst them to a really gigantic horse-breeding industry, which is one of the greatest resources of agriculture in the country, and the importance of which may be judged from the fact that horses to the value of £1,166,000 sterling, or thereby, are exported every year.

GIVE HORSES A CHANCE WHEN THEY ARE YOUNG

Give the colts a chance! No colt can develop into a large, useful horse if he is stunted in his early growth.

The result of good care and feeding is forcefully shown by the condition of the young work horses of the animal husbandry department of the Kansas State Agricultural college. These horses were purchased three years ago as weanlings. They were given care and proper feed their first winter and were in a good healthy growing condition when turned out to pasture in the spring.

When three years old these colts were worth $250 to $300 each. Colts of the same age and from the same mares, but kept on the farm and given the usual farm treatment, were worth only $125 to $140 each. Thus a difference in value of $125 to $160 was due to no other reason than the care given to the horses as colts.

"The horse is made the first eighteen months of his life," says Dr. C. W. McCampbell, assistant professor of animal husbandry in the Kansas State Agricultural College. "If he is stunted he never reaches his maximum development.

"Too often colts are turned out to rustle for themselves the first winter and all such colts can do is to keep alive. Their growth is stunted and they make a small ordinary type of horse."

SUNSTROKE IN HORSES

Sunstroke is caused by the direct rays of the sun falling upon the skull. A horse so affected may die suddenly as though stricken with apoplexy or he may have a gradual paralysis of respiration. The symptoms which usually present themselves are restlessness, pawing spasms and a marked redness of the mucous membranes lining the cavities of the head. The temperature in sunstroke may not rise above normal during the course of the whole disease.

Another condition very similar to sunstroke is that known as heat stroke or heat exhaustion. This is brought about by over-exertion and insufficient heat elimination. The direct rays of the sun are not responsible for this affection, which very often occurs to an animal on a cloudy, sultry day. Some of the most prominent symptoms of heat stroke are weariness, profuse sweating, difficult breathing, an extremely high temperature, and a rapid pulse, which gradually grows weaker and upon the approach of death muscular tremors will be noted. The treatment for sunstroke and heatstroke are the same. Remove the animal to a cool, quiet, well ventilated place and permit a stream of cold water to flow over the horse, and if possible apply ice packs to the head.—North Dakota Experiment Station.

CONTRACTED FEET

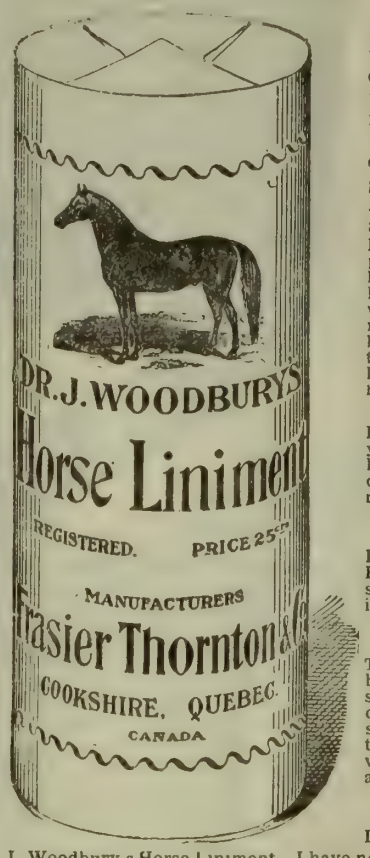
"I have a horse with a contracted hoof. What is the best thing to do for same?—I. I. B., Wiste, Alta.

If possible work this horse at home on the land and keep the shoes off him. This wil soften up his feet and get them to grow. Such hoofs are usually dry and hot and a blister about the hoof head will hasten growth. One of the best things for horses with contracted or tender feet is to get some blue clay—note this is blue clay—if possible. Wet this and stand the horse in it for two or three hours every day; in fact an arrangement may be placed in the front part of the stall where the horse stands so that his feet can be wet all the time he is standing in. Many a horse has been changed from a cripple by this treatment. White clay would be valuable if blue clay cannot be found, or cow manure placed in an old sack horse's hoof is also good. If shod, a shoe with a wide web should be used, pressing against the wall only, and the heels and frog should not be pared down.

Give the horse a chance; he's only half a horse with a sore shoulder. Give him a decent collar and fit it properly or turn him out to good pasture.

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

INFLAMED, BOWED TENDONS

are quickly cooled, soothed and strengthened with ABSORBINE. It is powerfully penetrating and efficient, but does not blister or cause any inconvenience, and horse can be used.

ABSORBINE

TRADE MARK REG. U. S. PAT. OFF.

is used by successful trainers, in developing fast, high-class race horses, getting them to the races fit and ready, and keeping them sound and strong throughout the season. They require a dependable, efficient liniment—one that does it work well, in a mild, soothing manner, and which, when used as a leg brace or wash, will stop inflammation and keep out the soreness from the strained, fatigued muscles, so that there will be no stiffness or "tying up" after a hard work-out or race.

ABSORBINE, used full strength when needed, and diluted for a wash or brace, helps the horse stay strong and win a race that otherwise might have been lost.

ABSORBINE reduces bog spavin, thoroughpins, wind puffs, shoe boils and other similar swellings and soft bunches; allays pain and inflammation; stops lameness quickly.

SPAVIN CURE
at any druggists at $1 a bottle, 6 for $5, and Kendall's will cure. Thousands of farmers and horsemen will say so. Our book "Treatise on the horse" free. 115
Dr. B. J. KENDALL CO., Enosburg Falls, Vt.

The hen provides for her brood, scratches for her living, works, and very early teaches the little chicks to do likewise. Men may learn a lesson from the hen.

POULTRY.

TO KNOW ROUP

One would judge that every poultry keeper would know roup at first sight or sound, and yet many who have kept poultry for years do not know it, if the poultry editor must judge aright from the numerous queries he gets. Many are the failures in the poultry business because of this disease that shows up in its worst form usually during spring or fall months.

If it comes in the spring it comes at the very worst time, for this is the time you want strong eggs and plenty of them. Roup may first show itself to you by the unaccounted-for sudden deaths of some of the chickens. Yet, had you noticed, the premonitory symptoms could have been seen in others of the flock. This is one way it has sometimes of appearing in the fall. But in the spring, if you keep close watch, you will notice the first symptoms—difficult breathing, open mouth, wheezing with or without exertion, may be a rattling in some cases. These signs might mean simple influenza, but it is well to get the afflicted away from the well right now, for more often than not, it is the genuine roup, which next will show by watery discharge from nostrils and throat, and soon, in many cases, swollen and bulged eyes, ulcers in the mouth, depressed condition, ruffled feathers, sudden loss in laying. Not all cases may give forth that putrid smell from mouth and throat, but should you notice this in a few cases, or even one, you have genuine roup to contend with, and must act accordingly.

INCREASING THE EGG YIELD

Those who are anxious to specialize in the production of eggs should retain chickens for breeding purposes from the best individual layers. This is a comparatively simple matter, thanks to the introduction of trapnests. By continuing the selection of chickens from good laying strains for several seasons, provided always that care is exercised in choosing the males from a good egg-producing strain, pullets will be eventually bred than can be relied upon to produce a fairly large quota of eggs in winter. How far selection for the heavy layer can go without doing bodily harm to the hend has not yet been experimentally tried in this country; but it seems reasonable to suppose that the abnormal layer must lose in constitution, and thus fail to breed chickens with sufficient stamina to continue the improvement commenced by its progenitors. We would say that if the poultry-keeper can succeed in getting 150 eggs per annum per hen, and by careful selection and judicious management perpetuate this quality, he can do so without impairing the constitution, and so secure an excellent remuneration from his enterprise. The parent stock transmit both good and bad qualities to their progeny, and it is generally found that hens have the greater influence in this direction.—Expert.

There is nothing the chickens enjoy better than a thick hedge near their poultry house in winter, and one any place handy in summer. A close hedge of any kind is a protection to the poultry house in winter and is not difficult to provide, and is a cool spot in and about which the fowls love to dust and hide on the hot summer days. Notice them, too, on the cold days hunt the sunny or wind protected side of a fence closely boarded. Some people never think of providing for the comfort of chickens by these cheap means.

Lay for the hens that do not lay, and make it pleasant for those that do.

How often do you fix the fire?

IT is necessary work which we have tried to lessen for you in making the Kootenay. And this is how:

The "Kootenay" is fitted with duplex (double) grates which clear out the ashes with a few turns of the shaker. Ashes do not cling to the smooth sides of the firebox; a glance shows the almost imperishable strength and solidarity of its thick semi-steel linings which are of the highest heat-resisting power, never getting out of order.

In taking out the ashes there is no need of spilling them over the floor. The ash-pan is made large enough to hold more than one day's ashes.

McClary's Kootenay Range

Careful thought now, before you buy your range, will save your time, your money and your temper in years to come. Our new booklet explains clearly the things that you should know about your new range. We have these booklets for free distribution, and you may secure one by sending the coupon to the factory.

MORE THAN A HOME

By Keith Kenyon

Perry's usual Friday evening call on Miss Lamont had endured for five minutes. "You do not look like yourself to-night," he pronounced meditatively.

A faint flush warmed her cheeks. Her emotions were always thus as through a sweet transparency.

"It is your hair," he said again. "You haven't a crimp or curl. And that dark gown, plain around the neck—you look five years older. I don't like it either."

She spoke her answer firmly, although her redness deepened. "I think Mr. Halden likes it," she said.

"Halden?" he echoed. "Lord! It is for Halden. It disturbs him to see you look so young—is that it? He recalls the days when he was your age—fifty years ago, say——" The look in her eyes stopped him. They always chaffed, but there was something different in this—something sharper.

"I will not quarrel with you," she said, "for we are too old friends." That was true. They were the best of friends. He had lent his influence to secure her the business position which she held with a credit born of efficiency, and she had in return shown him many tactful, womanly little favors.

"What is it about Halden, then, Julia?" he asked. "What's up?"

"I think," she answered, "I ought to dress to please Mr. Halden if I can. He would not like—his wife to look so much younger than himself.

"His—wife "

"He has asked me to marry him, and I have made up my mind that I will."

"Do you care for him?" They had scoffed humorously at love; they had even proved to their own satisfaction that there was in reality no such thing.

"I respect him."

"You respect the memory of George Washington, I hope! Heavens! Is that all you have to say, Julia?"

"No," she answered him, "it is not. I am not afraid to tell you, my friend—no, nor ashamed. I am going to Marry Halden because I—I want a home. I don't want this always." The room was agreeable, but it was conpicuously a boardinghouse parlor.

He murmured, with frowning brows: "No. Well?"

"Mrs. Denton—you met her, you know—has sent for me to come to Boston and take a position her husband has waiting for me. It is a better one, and I should have gone, but—Mr. Halden," she hesitated, "had spoken——"

"You mentioned that," he remarked tartly.

"I could go to Boston," she said, "or to London, or Paris, but that would not help me. I should be no nearer home. I am tired; that is it. I want somebody that I shall have the right to depend on and trust. What it would be to have somebody always to see to checking my trunk and make bargains with hackmen and—and always to pay my street car fare—what it would be!"

He felt baffled. He suffered from an unreasonable but burning spleen. "But," he cried with energy, "Halden! If there must be a victim, why of all men Halden?"

"Because he wants to be the victim," she returned.

"Probably he thinks he does. Most men have spasms of mental aberration, and this is Halden's. Julia, you would never take advantage of it? Julia, you couldn't!" He got back his old way with her—which lay between banter and mild bullying—and with it his hold on himself. He warmed to his subject.

"Married!" he said. "Halden married! It's inconceivable. It is appalling."

"Many thanks."

"Oh, you might not make him much more miserable than any other woman would. But, Julia, do you know how Halden puts in his time?"

"He spends some of it——"

"Here, yes; that is a serious symptom of his attack of lunacy. But what has he been doing for the last—I won't undertake to say how many years? Why, hanging around the club and absorbing the news and refreshing liquids; going to an occasional stag dinner, and getting new cures for his gout—or neuralgia, is it? And taking a hand at poker now and then with the boys, and smoking on roof gardens and talking stocks and politics. That," Perry said, "is what Halden does, and he's done it till it is a habit with him, like eating and breathing. It would be a smaller undertaking to throw a steam engine off its track than to shunt Halden off his. And what would it result for Halden? Misery!"

"He seems willing to risk it," she observed.

"Willing—willing! I tell you it is his loss of mental equilibrium. In such a case, there is degeneration of the gray cells in the forepart of the cerebrum, and strange hallucinations are the outcome. Any doctor could make it clear to you. And you would take advantage of it? I cannot credit it."

She threw back her head and laughed.

"Don't laugh, I mean it," he said sharply, and for a space his eyes looked into hers. The long look burned its way through the something that had interposed ever between them—the flimsy barrier which their ignorance and their heedlessness had reared.

"Julia——," he faltered. The door bell rang.

"It is Mr. Halden," she said, with trembling lips. "Must you go?"

Nine days later, sitting in his office in the heavy gloom and the dullnes which for the past week had held, him, Perry received a letter. It was from Julia Larmont and it was brief.

"I am going to Boston this afternoon. Good-bye."

"Good-bye!" he muttered, fiercely scowling. But all his apathy had fled on the instant. She was going to Boston. What did that mean? He sprang to his feet. She was going that afternoon. "She'll take the boat," he hazarded. It was already past five. He seized his hat and called a taxi which drove him to West Warren street swiftly. She was there.

"I told you good-bye in my note," she remarked.

He saw with joy that her hair was wavy. "I have not come to say good-bye. Where is Halden?" he demanded.

"He is cruising around the lake with Mr. Crane," she answered, "and fishing. He had—an attack of his neuralgia, and I told him it would do him good to go. I—I thought over what you said, and I saw," she affirmed, not in humility, but in a rigor of pride, "that it is true. It would have been a mistake; I—from the first feared it. And—I almost think he agreed with me, in his heart. So, after all, I am not going to have a home. I am going to Boston." She smiled bravely.

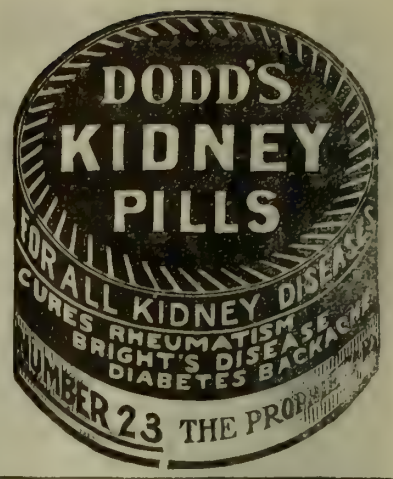
"Those are misstatements," he answered, "both."

"What do you mean?"

"You will have a home, and you will not go to Boston," he returned though he spoke to the back of her head, abrutly averted. "As I reckon

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers Box 309, Windsor, Ont.



Health for Sick Women

For Forty Years Lydia E. Pinkham's Vegetable Compound Has Been Woman's Most Reliable Medicine —Here is More Proof.

To women who are suffering from some form of woman's special ills, and have a constant fear of breaking down, the three following letters ought to bring hope:—

North Crandon, Wis.—"When I was 16 years old I got married and at 18 years I gave birth to twins and it left me with very poor health. I could not walk across the floor without having to sit down to rest and it was hard for me to keep about and do my work. I went to a doctor and he told me I had a displacement and ulcers, and would have to have an operation. This frightened me so much that I did not know what to do. Having heard of Lydia E. Pinkham's Vegetable Compound I thought I would give it a trial and it made me as well as ever. I cannot say enough in favor of the Pinkham remedies."—Mrs. Mayme Asbach, North Crandon, Wis.

Testimony from Oklahoma.

Lawton, Okla.—"When I began to take Lydia E. Pinkham's Vegetable Compound I seemed to be good for nothing. I tired easily and had headaches much of the time and was irregular. I took it again before my little child was born and it did me a wonderful amount of good at that time. I never fail to recommend Lydia E. Pinkham's Vegetable Compound to ailing women because it has done so much for me."—Mrs. A. L. McCasland, 509 Have St., Lawton, Okla.

From a Grateful Massachusetts Woman.

Roxbury, Mass.—"I was suffering from inflammation and was examined by a physician who found that my trouble was caused by a displacement. My symptoms were bearing down pains, backache, and sluggish liver. I tried several kinds of medicine; then I was asked to try Lydia E. Pinkham's Vegetable Compound. It has cured me and I am pleased to be in my usual good health by using it and highly recommend it."—Mrs. B. M. Osgood, 1 Haynes Park, Roxbury, Mass.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

DIARRHOEA

Was Caused By Change of Diet, Etc.

Diarrhoea arises from many causes such as, change of diet, change of water, change of climate, catching cold, the eating of unripe fruits, or anything that will cause or induce an excess of bile.

On the first sign of any looseness of the bowels it should not be neglected, but should be looked after immediately, for if not diarrhoea, dysentery or some other serious bowel complaint may ensue.

Mr. Geo. Smith, Victoria, B.C., writes: "It is five years ago since I first tried Dr. Fowler's Extract of Wild Strawberry. I was then on a timber survey, and suffered greatly from diarrhoea, caused by change of diet, etc. A friend in the party gave me a few doses which gave me great relief. Since then I have been in survey work, and would as soon think of starting out on a trip without my compass and blankets as without my supply of Dr. Fowler's Extract of Wild Strawberry, which I consider the woodsman's best friend."

Dr. Fowler's Extract of Wild Strawberry has been on the market for the past seventy years, and is universally known as a positive cure for all complaints arising from any looseness of the bowels.

When you ask for "Dr. Fowler's" be sure you receive what you ask for as there are many rank imitations of this sterling remedy placed on the market to try and fool the unsuspecting public.

The genuine is manufactured by The T. Milburn, Co., Limited, Toronto, Ont.

it, we have been fools for four years, and that is long enough, Julia."

She faced him with valiant resistance. "I won't consider it," she declared. "It is mental aberration."

"If you say so, but it is chronic. It is hopeless."

"It should be cruel to take advantage of it—inhuman."

"No, no; you are inhuman to confuse me with Halden, that is all. What are we dawdling here for? Come!"

"I can't!" she gasped, "my trunk is on the boat."

"No matter. It is not your trunk," said Perry, with rude and joyous laughter, "that I am going to marry."

Her cheeks were tenderly flushed and her lashes moist. "We shall always quarrel," she murmured faintly.

"And I," he answered, "shall always come out ahead in the second round." He defied convention and the cold-hearted onlookers, and put his arm around her.

INFANTILE PARALYSIS

(Issued by the Department of the Public Health, Nova Scotia.)

Acute anterior poliomyelitis, commonly called infantile paralysis because it usually affects young children, is at present epidemic in exceptionally virulent form in the city of New York, and has caused many deaths. Inasmuch as there is a possibility that the epidemic may spread, it is thought wise to issue this bulletin.

The disease is not unknown in Nova Scotia, an occasional case being reported from widely separated localities. With us, it is more common in the rural districts that in the cities and towns.

It is due to one of the tiniest of micro-organisms, an organism so small that it can be detected only when massed in groups in the field of the microscope. The germ losses its virulence very quickly when exposed to the air, and this is doubtless one of the reasons why the disease is not more prevalent than it is. Some "strains,, of the organinsm appear to be more active in causing the disease than others. It is thought that the "strain" responsible for the present epidemic in New York may have been brought by immigrants from southern Europe.

We are in ignorance of many of the factors concerned in determining an attack of the disease. It is infectious, and yet it is unusual for more than one child in a family to be attacked even though several may be undoubtedly exposed to infection. Occasionally, however, several members of a family may be infected, and on rare occasions adults suffer from the disease. Often thee strongest and apparently the healthiest member of a family is the one to fall ill, so that the best of health does not insure safety from attack.

The first symptoms are, as a rule indefinite and may suggest only some disorder of digestion. The characteristic paralysis usually does not appear for three or four days. During the time of epidemic, therefore, the slightest indisposition on the part of a child should lead to a phycician being summoned.

Many cases are "abortive" and do not go far enough to cause any paralysis Such cases may, however, transmit the infection to others.

The infectious element is given off especially in the discharges from the nose, throat and mouth, but possibly also in discharges from bladder and bowels. It is thought that infection is received principally through the mouth. All discharges from a patient should, therefore, be disenfected immediately upon issuance from the body and any article soiled by such discharges should be disinfected at once. It is of special importance that the hands of those in attendance upon the patient be most carefully cleansed after rendering the patient any service. The dishes used by the patient should be separately washed, better sterilized, and reserved for his use alone.

SACKVILLE, N. B.

It is generally thought that the infection is disseminated especially by "carriers"-people who, although not themselves ill, have been in contact with patients or their discharges and harbor the germs in their throats. Those who have had the disease, even in the abortive form, may also be carriers for some time after convalescence has set in.

It is difficult to identify carriers, but all who may have come into contact with patients suffering from the disease, or who may themselves have had it, should regard themselves as possible carriers and ask the advice of a physician as to how they may render themselves non-infective.

Every patient suffering from the disease should, of course, be strictly isolated, and every case of the disease should be immediately reported, as required by the public health act, to the appropriate Medical Health Officer If energetic measures are adopted immediately upon tthe appearance of a case, the community may be saved a disastrous epidemic.

THE BABY'S MOUTH

Be sure to keep the baby's mouth very clean. Cleanse it at least twice a day with boracic acid solution—one tespoonful boracic acid to a pint of boiled water—and bath the gums with cool water when the baby is fretful and the mouth is very warm.

As soon as the teeth come through, clean them each day with the tip of an orange stick wrapped in cotton or a piece of soft cloth. At this stage baby will show a desire to chew everything within his reach. Select rings and toys which you can boil. Celluloid and painted toys have no place among the playthings of a young child.

ECZEMA WAS CURED TWELVE YEARS AGO

Dr. Chase's Ointment Proved to be a Permanent Cure

The old idea of eczema being a disease of the blood has been pretty well exploded by the record of cures made by Dr. Chase's Ointment.

Some doctors still advise internal treatment, but the results are slow and uncertain, and too often a lamentable failure. With Dr. Chase's Ointment it is different. You apply the ointment to the sore parts. It cleanses the sores and soon sets up the healing process. In a few days you can see with your own eyes the wonderful change that is taking place and are encouraged to keep up the treatment until the cure is complete and the sores replaced by smooth, natural skin.

It is wise to look after your general health, keep the bowels regular and the blood rich, but you can depend on Dr. Chase's Ointment to cure the eczema if you will do your part and apply it regularly.

Mr. W. H. Roberts, Charlottetown, P. E. I., writes: "I can recommend Dr. Chase's Ointment to anyone suffering from itching skin disease. I had eczema on my leg and suffered terribly from the itching. I had a doctor treat me for four months without relief, and I was getting worse all the time. A second doctor gave some relief for a time, but made no cure. I tried several advertised treatments, but without relief until I used Dr. Chase's Ointment. This ointment cured me in a month. That was twelve years ago, and have never had a sign of the old trouble since.

"Since then we have always kept Dr. Chase's Ointment in the house, and find it invaluable for chafing, chilblains, insect stings and burns. I would not be without it if it cost $5 a box."

"This is to certify that I am personally acquainted with Mr. W. H. Roberts, and believe his statement regarding the use of Dr. Chase's Ointment to be true and correct."—(Signed) Alex. Horne, Justice of the Peace.

Dr. Chase's Ointment, 60 cents a box, all dealers, or Edmanson, Bates &Co., Limited, Toronto.

THE GREAT KITCHEN GARDEN.

Quick, continuous growth and a cool moist soil are the essentials of lettuce and other salad crop culture. However, lettuce is very easy to grow and is invariably a seed bed crop, coming to quick maturity and leaving the land ready for a succession crop.

Common sense and a little acttion will do more for the household's supply of lettuce than any expenditure of money. A good spot of ground and plenty of water and good seed are really all that are required. The grower, with slight effort, can keep the weeds out of his crop:

A good salad can be made from wilted or stale plants. Thus, the best salads are practically prohibited to people without their own garden. The plants should be freshly picked within half an hour before meal time.

Lettuce may be followed by cabbage, cauliflower, celery and various other later crops. Successive sowing can be made as often as once every ten days or two weeks. The ordinary spring variety grows quite well in summer.

Lettuces is commonly grown in rows from 8 to 12 inches apart and thinned later on to make the plants stand 6 to 12 inches apart in the rows.

ROOT CROPS.

Root crops are especially popular with the small gardener because no special skill is required to grow them. They are hardy and require a cool season and a deep soil and are sown in drills.

The principal root crops are the radish, beets, carrot, turnip, ruttabage parsnip, salsify and horse-radish.

The value of the root depends on its straightness and symmetry. Thus, it is desirable that the gardener spade deep and loosen the soil more than on the mere surface.

The small red spring raddish and the longer and later one are the two best adapted to the back-yard. They can be sown before frost is out of the ground. They can from the first planting be sown at intervals of from 7 to 10 days to supply the table through the summer. For the later planting select a cooler spot in the garden.

The beet can follow some of the lighter crops and if weeds are keept down well while the plant is young a good crop is assured, as this vegtable is one of the hardiest.

Far carrots be sure the land does not break over the seed. Carrots also must be consciously protected from weeds. Seeds of early raddish can be sown with them.

Turnips are hardy and seeds germinate quickly. The produce is large enough for table use within six to ten weeks after planting.

Parsnips take the full growing season. Salsify, which is used for cooking purposes only, does also. However, if the young plants of the latter are thinned to 4 or 5 inches apart a hardy crop that may be left in the ground during winter will result.

TOMATOES

Although the amateur gardener rarely pictures tomato growing without thinking of the plants he has seen in the corner grocery, there is no reason why he cannot grow his own from seed, if he is sure he wants tomatoes and plenty of them. These plants take up much space and require the full growing season. In the north they grow until killed by frost.

A few plants, if well cared for, will furnish a family with the necessary supply. For the man who is not going into tomato culture extensively it is advisable to purchase the few plants needed.

The tomato is essentially a hot-season crop and no chances should be taken on premature planting. It is grown in hills and needs a quick-acting fertilizer applied during early growth for the best results. Sometimes two or three transplantings are made to obtain continuous-growing plants. Early and steady picking must be practiced to save the crop from fruit rot.

The plants are usually started from four to eight weeks before they are transplanted to the field. If a good fertilizer has been well worked into the soil some weeks prior to transplanting the best results can be obtained. Experiments have shown that a light application of nitrate of soda when the plants are set, works wonders.

In training the vines the best way is to prune the plant to a single steem and tie them to a perpendicular cord which is secured top and bottom to horizontal strands streched between long stakes. If this is to be done plants may be set as close as 18 inches in the row. When frost threatens the largest green tomatoes may be picked and allowed to ripen in dry close places.

PEAS AND BEANS

No garden is complete without peas and string beans. The only difference in the two, botanically, is that peas are hardier and a cool season crop, while warmer weather is required by the more tender bean. Atmospheric nitrogen goes into the making of both, and if any amount is to be grown it is advisable to use a fertilizer containing this quality.

Garden peas are easy to grow They do best in spring rather than in the hotter months and also thrive in fall from late sown seeds. Even before freezing weather is past peas may be sown. They should be planted from 3 to 5 inches deep. The pea

LUNG AND CHEST TROUBLES
Cured by
VENO'S LIGHTNING COUGH CURE

The incomparable efficacy of Veno's Lightning Cough Cure has made it the supreme remedy of modern times for lung, chest, and throat troubles in children or adults. It is sure as it is quick, and safe as it is sure. You will not be disappointed if you trust to Veno's as a remedy for Coughs and Colds, Asthma, Bronchitis, La Grippe, Nasal Catarrh, Whooping Cough, and Bronchial Troubles in old or young. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

"Canadians at Ypres"
(See store windows.)

12 Outer covers from the 60 cent size of Veno's Lightning Cough Cure, or 24 from the 30 cent size, mailed to Harold F. Ritchie & Co., Ltd., 10 McCaul street, Toronto, entitle you to a beautiful coloured reproduction of this famous Royal Academy painting. The reproduction is on view in most druggists' windows.

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

"Do You
Suffer after your Food?"
Don't Take Risks.
Poor appetite can only mean that your digestive system is out of condition, that you are not getting nourishment from your food. Where then is strength to come from—strength for body, strength for brain? You simply can't have it. You must become weak and run down.
Don't take risks. Let Dr. Cassell's Tablets restore the living force of your system and give tone and efficiency to your digestive organs. Then you will have appetite, nourishment, strength, fitness. These Tablets don't drug you; there is nothing in them narcotic, purgative, violent, or dangerous. A child may take Dr. Cassell's Tablets. They are compounded of just such nutrient-restoratives as any high-class specialist would prescribe. And there is this advantage that you can get them from any druggist or store-keeper in all Canada.
Dr. Ramsay Colles, J.P., of Dublin (Ireland), F.R.H.S., &c., says:—"Dr. Cassell's Tablets constitute a safe and reliable family remedy, and appear to be specially effective for nerve and bodily weakness."
Dr. Cassell's Tablets
Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-spasmodic, and the recognised remedy for
Nervousness, Nervous Breakdown, Neurasthenia, Sleeplessness, Anæmia, Malnutrition, Dyspepsia, Palpitation, Kidney Trouble.
Specially valuable to Nursing Mothers and Women of Middle Life.
Sold by Druggists and Storekeepers throughout Canada. Prices: One tube 50 cents, six tubes for the price of five. War tax two cents extra per tube.
Free Sample
On receipt of 5 cents, to cover mailing and packing, a generous free sample will be sent at once. Address Harold F. Ritchie & Co., Ltd., 10, McCaul-street, Toronto.
Sole Proprietors: Dr. Cassell's Co. Ltd., Manchester, Eng.

FOR
Indigestion
and
Biliousness

Indigestion, biliousness, headaches, flatulence, pains after eating, constipation, are all common symptoms of stomach and liver troubles. And the more you neglect them the more you suffer. Take Mother Seigel's Syrup if your stomach, liver, or bowels are slightly deranged or

is one thing that will thrive best in a soil that is not too rich. A strong soil tends to make plants run vines and delay the crop. Sewings may be made at intervals of 6 to 10 days throughout the growing season to obtain a continuous crop.

For the early crop the dwarf varities are ideal. In handling the taller and later kinds the grower will do well to practice pinching in the excessive growths. This assures a larger and quicker yield.

Two or three cultivations during the growing season are usually sufficient for peas. They can be sown from 6 to 8 inches apart in rows. The plants should be from 3 to 4 inches apart in the rows. If the dwarf varieties are grown, each plant will tend to support the other. But if the taller kinds are attempted, chicken wire between rows will prove excellent support.

The bush bean and the pole bean are the common varieities, although the former, requiring the less labor, is the more popular. As a garden crop, bush beans are used mostly as "string" beans, the pod being plucked when two-thirds grown and both pod and beans eaten.

Plant only when the weather has become settled. A late summer planting may follow the earlier one and provide beans until late in the year. The bush beans are sown in drills, rows being rarely less than 18 inches apart. The plants should stand from 5 to 10 inches apart in the row.

SWEET CORN

Corn is distinctly a "made in America" product. Columbus found it there when he arrived and there it has remained as far as popularity is concerned, for the rest of the world it practically is still unknown.

Sweet, or sugar corn is the only kind to be attempted by the backyard farmer. But no large garden is complete without a representation of it. Sweet corn is grown for its immature ears, which are eaten when the grains are yet soft.

The soil should be fertile and quick. The coarser manures left over after fertilization of ground for the smaller vegetables, will be useful for the corn patch. Small gardeners are advised to plant the home supply in drills, three feet apart, with the seed dropped from 10 to 12 inches apart in the rows.

Corn is essentially a surface feeder, that is, it takes its growth out of the very top layer of soil. Thus, care that the seeds are not buried too deep and that the surface soil is well pulverized should be the lookout of the gardener.

A common practice of market gardeners that may well be abopted by the man for the small plot is that of sowing early, intermediate and late varieties at once, ensuring a continuous yield. The same idea is also often carried out by sowing at intervals of two or three weeks.

When this is attempted the grower must gather the ears from the early varieties as soon as they are set, so the later kinds will not be robbed of the plant food.

Corn it must be remembered needs moisture and if the ground possesses a good supply and is well drained, frequent cultivations with the hoe will ensure a good crop.

A POINT IN HORSE JUDGING

Equilibrium means equally distributed weight or equipoise, but the average horseman does not have that in mind when he speaks of weight. He merely means "heft" as he sometimes calls it, and judges by the weight how a horse has developed and what he thinks will be his capacity for labor. The true student sees much more in the matter than that and so we shall say something about it for the farm boys of the Successful family that they may better understand the subject. One seldom, if ever, hears the weight of a draft horse, or light horse, quoteed in Great Britain or France, where horse have been so successfully produced.

To understand the significance of equilibrium in a horse it is necessary to know what "centre of gravity" and "line of gravitation" mean and where the former is located in the body. Without going into very elaboratte or scientific definition, let it be said that centre of gravity means the point where all the forces of gravity centre and where the forces destroy or annul one another so that the mass is at rest. The line of gravitation is that through which the force of gravity falls from the centre of gravity to the ground. If the centre of gravity of the horse is known, then a plumb line dropped from there to the ground follows the line of gravitation.
of gravity of the horse is located just behind the eighth rib, near to the elbow joint and on a line drawn from the point of the shoulder to about the middle of the thigh. The exact point is found by intersecting this line with one dropped perpendicularly to the ground at the eighth rib. That means that the centre of gravity is in the middle of the mass of the body just back of the elbow or at and above the end of the back of the sternum of brest bone. Theoretically the horse would balance on a point at the center of gravity and be at equilibrium or equipoise.

Next remember that the base of support of a horse is formed on four broken columns (bones and jointts) resting upon points which are the feet. These four feet when joined by an imaginary line form a rectangle or polygon and if that were permanent the horse always would be in equilibrium, but the moment he moves a foot the equilibrium changes or is affected. When a horse trots he advances one hind foot and one fore foot diagonally and so is balanced on two diagonal bipeds. When he paces he moves by lateral bipeds, or two feet on the same side of the body, the other two (lateral bipeds) being off the ground at that time. It may readily be seen that the horse may also be balanced or supported on only one foot at certain times, or on two hind ones when rearing, or two fore ones when landing from a jump, or may have no feet upon the ground for a moment when galloping. Equilibrium, therefore, will depend upon what the motion happens to be. It is down, because the centre of gravity is near the ground and the line of gravitation within the base of support. It is lessened when the horse rises and the taller he is and the closer the feet are together the less will be the equilibrium.

If a horse always were in a state of rest one might make exact statements about the subject of centre of gravity and line of gravitation, but remember that he is constantly moving. Each time the head is raised or lowered. or any change made in position of the body, equilibrium changes, is lessened or increased, wittingly or unwittingly, and may suddenly be thrown out of control so that the animal falls. The rule to remember is that for equilibrium the line of gravitation always should fall inside of the base of support. Whenever move quickly to avoid falling. Chances of the line of gravation forward within the base of support takes place when the running horse advances and elevates his head, and such a change necessitates fast movements of the legs to prevent falling. Such changes are not so dangerous as those outside of the base of support to the side, for when the latter occur it is more difficult for the legs to be moved to the side to support the body than when the legs have to be advanced for that purpose. Knowing this, one should be very careful to avoid side slips when riding or driving a horse. Never turn a galloping horse quickly, nor when galloping or trotting on a cement road turn the horse suddenly to enter another street or alley. Falls readily occur at such turns and bones may be fractured. The writer once had a fine saddle horse killed by just such a foolish turn made by the groom. The animal suffered a broken back and leg by the consequent fall.

Understanding the matters we have touched upon here the scientist alleges that "instability of equilibrium gives the measure of speed" and that is correct. There is no speed when the horse stands still. The greater the changes in the position of the line of gravitation outside of the base of the support, the faster will the legs have to be moved to avoid a fall. For this reason the running horse goes at a tremendous rate, for he advances his long neck, on the end of which there is a heavy head, and in so doing the center of gravity is advanced far ahead of the base of support formed by the two fore and two hind legs in their normal position. The horse in consequence has simply to chase forward, to get his legs or feet under his weight and thus avoid a fall.

The draft horse, on the other hand,

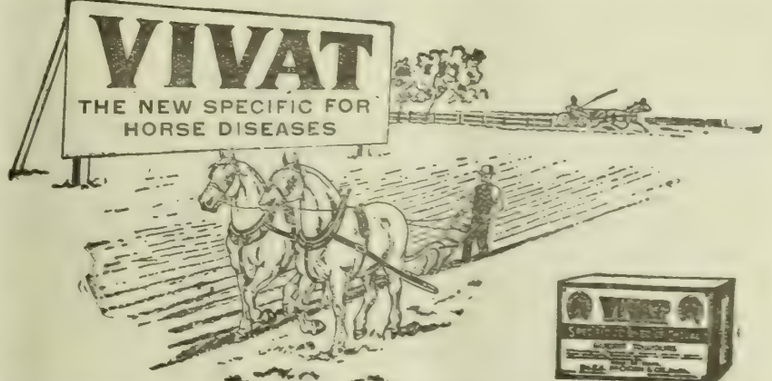
VIVAT
THE NEW SPECIFIC FOR HORSE DISEASES



"VIVAT" is an energetic remedy in powdered form, prescribed with great success by prominent Veterinary Surgeons, for the absolute cure of COUGHS, HEAVES, etc. It acts as a diuretic in cases of COLICS and is prescribed for WORMS.
"VIVAT" strengthens DRAUGHT-HORSES as well as RACERS and gives them endurance.
A 50c Box of "VIVAT" is sufficient for 6 days' treatment.
FOR SALE BY ALL PROGRESSIVE MERCHANTS.
DR. ED. MORIN & CO., LIMITED - - - - QUEBEC, CANADA

does not have to move fast but has to move a great weight and so, when he goes to start a load, he lowers his head, brings it back to his chest, crouches his body, crooks his hind legs at the hocks, gets a grip on the ground with his toes and then straightens out his hocks by action of the great muscles of his hind quarters and loin. He lowers the center of gravity, increases equilibrium and takes full advantage of his stability and strength. Weight also enters into the proposition in holding him down and giving him the full advantage of his great muscles.

Take these matters into consideration when judging or buying horses and the estimate of the value of the horse will be more correct than ordinarily is the case.—A. S. A.

..PRESERVATION OF WOOD

From the stanpoint of the average consumer, more has been expected of wood and less done to help it serve a great variety of uses than almost any other building material. It is a comparatively modern conception that proper preservation treatment is prac tical and economical on the farm and around the house. Good paint is a good friend of lumber, and, while not usually considered in that light, is the one protection against the natural progress of decay which has been uni ersally used. Yet the well painted house has unprotected floor beams in moist walls, door steps on wet ground, and many inside surfaces and timbers which are continually exposed to conditions favorable to decay. The wonderful service which wood has given during all the years, with little or no consideration of the factors which destroy, brings into greater prominence the possibilities of preservative treatment under the present day desire for permanence and elimination of waste. No one expects unprotected steel to do anything but rust, concrete is waterproofed and its surface protected from abrasion and disintegration, fabrics are shielded from the elements, while wood has largely been left to shift for itself. The application of wood preserving methods to the every day uses of lumber, where it needs protection from decay, is in keeping with modern ideas.—Sterling.

BLACKLEG SERUM A CURE

Until serum was developed no cure was known once blackleg had attacked an animal. The only procedure was to vaccinate the entire herd, but this was not satisfactory after the diseasee had made its appearence, because it takes from five to seven days for the vaccine to take effect and a number of animals may die during that time.

With serum, however, the disease can be stopped instantly and in some cases affected animals cured. The use of serum does not interfere with the use of vaccine and can be followed by this in three to five days. This gives the animal protection after the serum treatment has lost its effect.

Blackleg serum has been used in Kansas on more than 2000 catle in herds in which stock was dying. Not a single case occured after its use, although in some instances animals had died in the herd within 12 hours preceding its use.

There seems to be no limit to the dose that may be given with safety and benefit. It has been used in doses of 500 cubic centimeters, or more than a pint, for three days in succession with good results on beef calves weighing about 400 pounds.

The doses employed as a protective measure are about 12 cubic centimeters for calves weighing beyond pounds, 20 cubic centimeters for calves weighing from250 to 460 pounds, 25 cubic centimeters for calves weighing 450 to 600 pounds and 35 cubic centimeters for stock weighing beeyond 600 pounds.

Fortunately corn contains some protein, as otherwise swine fed wholly on corn would die due to lack of this life-giving element in their ration.

Another Cup, Please!

A compliment the lady of the house may be sure of when she uses KING COLE TEA---and what woman does not like to have her tea appreciated!

KING COLE'S rich, mellow flavor gives the finishing touch to an enjoyable repast.

"Mother Says We Couldn't Run The Farm Without

CROWN BRAND CORN PURE SYRUP

IT'S downright scandalous, the number of 20 pound tins I buy. But, as Mother says, we use it for 'most everything.

"Nothing else tastes quite so good on all kinds of Hot Bread, Johnny Cake and Griddle Cakes.

"Mother uses it for all her cooking—for Cookies, Cakes, Gingerbread and Pies.

"And I am almost ashamed to mention the quantity of 'Crown Brand' and bread that my youngsters consume. This syrup certainly is a favorite in my home".

The 20 pound tin is convenient and economical for home use, although you can get "Crown Brand" in 2, 5 and 10 pound tins and 3 pound glass jars. Ask your dealer.

THE CANADA STARCH CO. LIMITED

Makers of "Lily White" Corn Syrup—Benson's Corn Starch—"Silver Gloss" Laundry Starch.

INCREASE YOUR EGG OUTPUT

What can we do to improve our flocks and build up an egg laying strain? When the hatching season is on I would advise you to bear these things in mind:

1. It must be remembered that a chick with a strong constitution is better equipped for fighting diseases than a weak chicken with all the medicines and condiments known to the medical science. Then breed for constitutional vigor.

2. Many disease germs are transmitted from parent to offspring, so all diseased birds, or birds which ever have been diseased, should be removed from the flock. This past month we had a striking example of high vitality and low vitality. Two pens were housed in the same house, drank from the same pen, ate the same kind of food and slept under the same roof. One pen went all to pieces and every one of them were sent to the hospital. The pen on the opposite side withstood the severe weather, kept in splendid health, and is one among the very highest pens in egg production.

3. Breed only from a male which has been hatched from an egg laid by a high laying hen.

4. Select your best laying hens to mate with the above male.

5. Breed from early maturing pullets.

6. Don't breed from hens which are continually going broody.

7. Breed from your hens and pullets which lay in November, December and January.

It is true the hen which has been laying through the winter will go to sitting first, but by this time the loafing hen has begun laying so the good hen is set on the poor hens' eggs, which practice has a tendency to produce a flock of loafers.—T. E. Quisenberry.

BREAKS ALL MILK RECORDS

From June 1st to July 15th the records of sixty-nine cows and heifers were received and accepted for entry in the Record of Merit. The sensational feature of this report is the Sylvia, the greatest milk producer the world has ever known. The largest official one-day milk record ever previously reported was 136.5 pounds. May Echo Sylvia sets the mark at 152.1 pounds. In seven days she gave 1005.8 pounds; in thirty days, 4,196.9 pounds; in sixty days, 8,220.1 pounds; in ninety days, 11,855.1 pounds, and in 100 days, 12,899.8 pounds, making her world's champion for all these periods. Her seven-day butter record of 41.00 pounds, gives Canada her first 40-pound cow; for sixty days, 323.32 pounds; for ninety days, 463.67 pounds and for 100 days, 505.34, all cahmpionship records for Canada. Some people affect to believe that payment for milk according to quality will give other breeds an advantage over the Holstein. May Echo Sylvia's record of 505.34 pounds of butter in one hundred days is a fitting answer to such claims. It is highly doubtful if any other cow in Canada, except a Holstein, could produce 75 per cent. of the above amount in the same time.

Three other cows make over 30 pounds of butter in seven days, viz.: Lady Aaggie Toitilla of Riverside, 30.49 pounds; Lulu Darkness, 30.33 pounds, and Jemima Johanna Wayne, 30.24 pounds. No senior four-year-olds are included in this report, but at the head of the juniors we find Princess Lulu Keyes with 27.06 pounds butter from 655 pounds milk. Gano's Bessie Faforit leads the senior three-year-olds with 27.05 pounds butter from 457 pounds milk. Pontiac Belle of Manor is best junior with 21.24 pounds butter from 419 pounds milk. This is only one of several very creditable records made at the Dominion Experimental Farms. Colony Netherland Segis 2nd scores for British Columbia in the senior two-year-old class with 22.84 pounds butter from 579.4 pounds milk, while Countless Walker Segis is a close second with 22.72 pounds butter. A class of nineteen junior two-year-olds is headed by Retta Maida Gladi with the good record of 24.51 pounds butter from 464.9 pounds milk. —Holstein Freisen Association.

BENDING ONION TOPS

Very frequently onions have a tendency to go to seed, especially those grown from sets, and more especially when the sets were rather large. To stop them from forming seed pods and ruining the growth of the onion, many persons have been in the habit of breaking or cutting off the tips of the stems carrying the seed pod. It is much better to simply bend the stems over, pinching them in such a manner as to stop the growth of the seed pod.

THOROUGHBRED OR PURE BRED

H. E. M. writes: "To settle a dispute, will you publish the correct use and meaning of the terms 'pure bred' and 'thoroughbred' as applied to live stock?"

The misuse of these two terms is one of the most common errors among those discussing pedigreed live stock. The correct application of hese shows thir essential difference of meaning.

The term "thoroughbred" applies to a distinct breed of light horse, the English running horse, and is used only to designate this breed in the same way as "standard bred" or "hackney" implies other breeds of light horses.

"Pure bred," which, to be correct, should be "purely bred," designates an animal from registered ancestry and with which a pedigree of breeding can be produced.

There is no more sense in speaking of a "thoroughbred" cow, sheep or hog than to talk about Shorthorn hog or a Berkshire sheep.

If your horses get sore backs and shoulders, it is your own fault. There is a thought in this connection that is worth while. It is about those backstraps that go down to the tugs. Do not try to regulate the draft by tightening the backstraps to the point where they will pull the tugs out of line. If they are even snug when hitched to the plow they will pull down hard on the back when hitched to a harrow. The work is hard enough to the team without the added burden of lifting the plow as well as pulling it. This weight comes directly over the loins where the back has no support from the ribs.

HOG CONDITIONERS AND WORM KILLERS

There are hundreds of formulas for hog conditioners. Which is the best has never been determined satisfactorily. A popular one is made up as follows:

Wood charcoal, 1 pound; sulphur, 1 pound; sodium chloride or common salt, 2 pounds; sodium bircarbonate or common baking soda, 2 pounds; sodium hyposulphite or the ordinary hypo used in photographic work, 2 pounds; sodium sulphate or Glauber's salts, 1 pound; antimony sulphite or black antimony, 1 pound.

These ingredients should be pulverized and thoroughly mixed. In case of undue laxativeness the Glauber's salts may be omitted. The dosage recommended is a large tablespoonful once a day for each 200 pounds of live weight of hog, to be mixed with the feed.

A formula used to a large extent in Iowa is made up as follows: Glauber's salts, 3 pounds; sal soda, 3 pounds; iron sulphate or copperas, 3 pounds; common salt, 1 pound; powdered sulphur, 1 pound.

The salt may be increased if desired, and this is sometimes done if the pigs tend to eat too much of this when it is allowed at free-will—the usual method. The salt is used as a governor or regulator, an increase or decrease of it affecting the consumption in proportion, but inversely. This mixture made up in large quantities should not cost more than two or three cents a pound. A number of our farmers are feeding it and apparently with good results, although there is no experimental work to back up their experience.

The animal husbandry section of this station has been working for some time on this condimental problem and so far our results would lead us to believe that these various materials if allowed, had best be given separately, or in "free-choice" style. A test conducted last year on eight groups of pigs showed some interesting results, which indicated, although not absolutely, that the addition of these compounds are beneficial. The best gaining lot received corn, tankage, sulphur, Glauber's salts and iron sulphate. The heaviest feed consumption was shown by the same lot, as well as the least feed requirement for 100 pounds of grain. In all cases where the separate ingredients were allowed in free-choice style the feed required for 100 pounds of gain was less than where these materials were mixed with the tankage. These are the results of only one test and should not be taken as conclusive, but merely indicative.

Generally speaking, worms are not killed by worm-killers, but they usually are paralyzed, so that they are no longer able to obtain a hold in the alimentary tract, and so are voided. Of course, it is entirely possible that some worm preventives will prevent the eggs from developing, and from that viewpoint the word "kill" may be in order.

For hogs that are infested with worms the best remedy I know of is a combination mixture of santonin and calomel. This can be given at the rate of 5 to 8 grains of santonin with 5 grains of calomel per 100 pounds of live weight. For a 200-pound hog we usually decrease the proportion somewhat, probably one-third or thereabouts, and a 500-pound hog would receive not more than 20 to 25 grains of santonin together with about 15 or 20 of calomel. The war has caused santonin prices to rise to a high figure, but disregarding the price if one wishes to secure results, he can certainly get them by using the santonin and calomel treatment—United States Experimental Station.

FIRST AID HINTS THAT WILL ASSIST IN HEALING WOUNDS

Living several miles in the country with no physicians or veterinarian, it is sometimes imperative to apply first aid to the injured until the proper help can arrive, be it man or beast. Many people have erroneous ideas about some of the more common remedies and they should be enlightened for their own benefit. It is a common practice to apply spirits of turpentine to all cuts or bruises of man or beast in which the skin is broken. Turpentine is not an antiseptic and it is doubtful if it does any good at all. It weakens and devitalizes the tissues, thus retarding healing rather than promoting it.

It formerly was a common practice among veterinaries and physicians to wash injuries and wounds with large volumes of an antiseptic solution in water, but it has been determined that so much washing weakens the tissues and washes off the protective serum that nature supplies for the repair of the injury. It is the common practice now, especially among veterinaries, to clean up the wound or injury by removing all dirt, hair, loose tissues, etc., and then apply a coating of tincture of iodine, either alone or in combination with glycerine, using one part of iodine to four parts of glycerine. Others prefer dry antiseptic dressings, of which there are several good ones. Iodine is one of the best antiseptics that we have; it stimulates healing, tends to stop minor hemorrhage, and will destroy any of the common bacteria that may gain access to the wound or injury.

In nail wounds or calk wounds of horses' feet there is no agent that will give better results than iodine. Clean, the wound thoroughly by removing all dirt, hair, loose horn, and any other foreign substance, using very little water (none if you can help), as the water will tend to wash the different disease germs down into the depths of the wound where the antiseptic can not reach them and it may also burrow to foreign parts that otherwise would not become involved.

If a person meets with an accidental injury from a corn cutter, ax, nail, or any other object, iodine is as good an application as can possibly be used. Keep the injury clean, and the doctor will have very little to do other than make an inspection and give some advice to the injured. If there is a great amount of hemorrhage, apply tincture of iodine, then soak absorbent cotton and apply to the injury, and then bandage if possible. It is handy to apply, and is safe and reliable.

Keep at least a half pint of the tincture of iodine, a pound of absorbe nt cotton, and a quarter dozen three-inch cotton bandages about the house, and you will be able to take care of most injuries and cuts in a very satisfactory manner until you can secure professional help.—G. H. Conn.

Plenty of young stock on the farm is the very best indication that the farmer is progressive. The man who has pigs, calves and other young stuff around him is surely looking into the future and providing for an income year after year.

The hog's body is composed of about 55 per cent. of water, and accordingly the porker requires plenty of water to maintain him in healthy condition.

THE TENDENCY TO HEAVY HORSES

Any reader who has lived in the central west as a pioneer will remember the pony horses with which the first farming was done. Could he see those horses today in comparison with the average farm horse of now he would be more than surprised at the difference in size. He remembers "Old Ned and Pete" as being small, but not as small as they really were. How we used to get as much work done as we did, and more especially when we consider that all machinery was at least a third heavier in draft then than now, is almost beyond comprehension.

The tendency of the times is toward a still heavier type of farm horses. Except where the soil is of a loose, loam nature, requiring less horsepower to move it, this tendency to heavier horses is proving a great help to better farming. As our soil becomes older it naturally plows harder, and whenever the seasons have been exceptionally wet, as the past two have been, the draft of all plows and cultivators is still further increased. The small horse, while possibly more active, cannot stand up to steady, heavy pulling as can the real draft horse. Since the almost universal adoption of the motor car for road work, there is no longer the need for the "all purpose" horse there once was; the farm horse of today is used almost exclusively upon the farm, or, if on the road at all, ahead of heavy loads—the motor car does the faster road work.

The old time theory that the small horse will kill the larger one at work is rapidly passing on. Time was, when the average farm team was used for light road work as well as for draft work in the fields, then there was reason in the theory that the light horse could outdo his heavier mate, but the work of the average farm horse is fast being simmered down to steady pulling where weight in the collar counts for more than swift action of the feet. Each year sees more and more heavy horses in use on the farms of the central west, and this is as it should be, for weight means power, and with power in plenty, the driver is more inclined to let the plow down to where it should go.—H. H. Kan.

PUSHING THE EFFICIENCY COW

The different dairy breeds are continually headed towards greater efficiency—increased production.

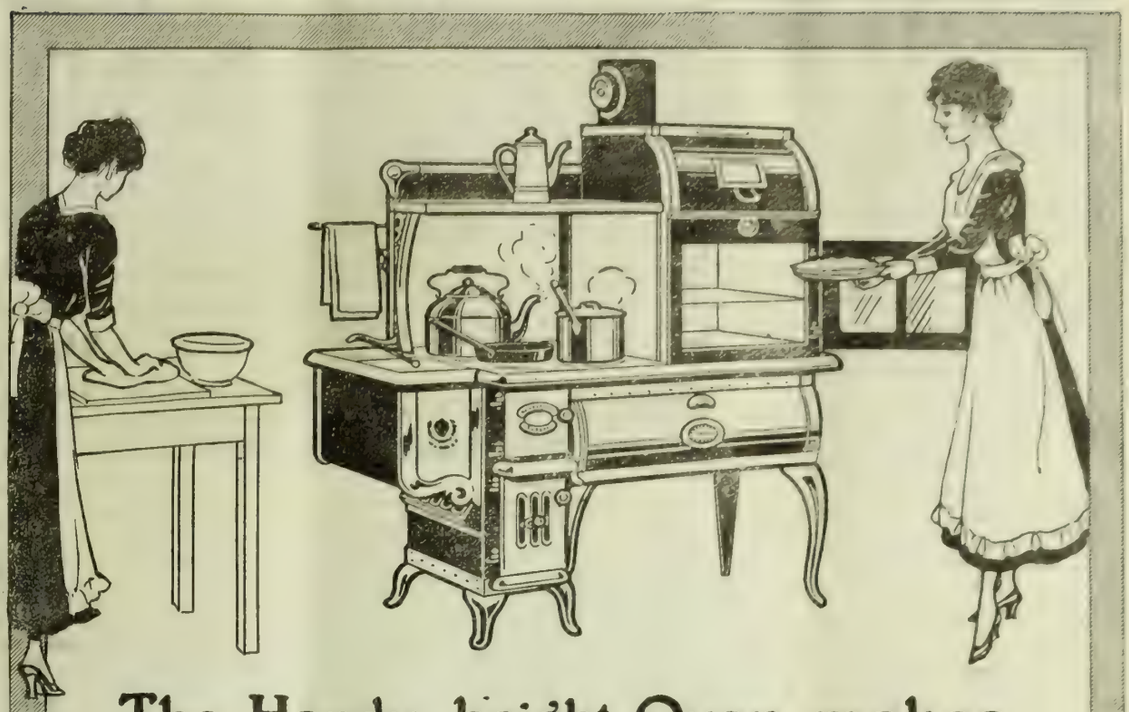
The American Jersey Cattle Club reports an incrase of 119 pounds of milk, 9 pounds of butter and .02 per cent. of fat for the last year, as compared with the year previous, taking ing into account 5244 tests. The average of all these tests is 5.35 per cent. fat.

The table below speaks well for this breed of cattle, and surely places them in the efficiency class. It is up to February 29, 1916:

	Milk lbs.	Fat lbs.	85% butter lbs.
1861 two-year-olds..	6,572	355	418
911 3-year-olds	9,377	400	471
668 4-year-olds	8,340	449	528
1,904 cows 5 years old or over.....	9,057	478	562
5,244 cows and heifers, all ages	7,792	417	490
10 2-year-olds	12,538	677	796
10 3-year-olds	13,626	779	916
10 cows, 5 years old.	16,803	928	1,092
Best 2-year-old records	14,513	816	960
Best 3-year-old records	17,793	910	1,071
Best 4-year-old records	16,147	937	1,103
Best records at any age	19,695	999	1,175

Official tests just concluded show that August Lassie, senior four-year old Ayrshire cow, has a record of 17,784 pounds milk, 720.03 pounds fat, and 840 pounds butter. Her milk averaged 4.05 per cent. fat. She is world champion in her class.

This breed also has another world champion, this one in the junior two-year-old class. She is Willowmoor Etta 3d, with a record of 16,621 pounds milk, 666.06 pounds fat, 784 pounds butter, and an average test for the year of 4.01 per cent. fat.



The Handy-height Oven makes a world of difference

Here is a big step in Kitchen reform.

Ranges with bend-over ovens made tired backs. Just try to count the many, many times dishes have to be lifted in and out of an oven. Count the times one had to stoop to see how things were baking. Modern woman has voted that stooping out of existence. The range of to-day *must have* a Handy-height oven.

For, a Lighter Day has dawned in the kitchen.

This new coal range has an oven that meets you at standing height. There is no bending over. Once things are placed in the oven they stay there until they are done. You don't bend down from time to time to see how they are doing. You simply watch them through the Clearview Door. Stooping is done away with absolutely. The thermometer, too, is up in plain sight.

And that Clearview Oven Door! Cakes have a far better chance when there is no jarring of the door. Isn't it a fine idea to save the constant disturbing of light cookery?

The Lighter Day Coal Range burns either coal or wood. It has six pot-holes, two of which are fully enclosed. Cooking odors can be kept from floating through the house.

This Lighter Day range is now in thousands of Canadian homes. Over 700 stores carry them in stock.

If you have not yet seen one, you can hardly realize the world of difference a Lighter Day would make in your work. Let us show you as well as we can in our Booklet, "A Lighter Day in the Kitchen." This is a booklet of photos showing a housewife using the many new labor-saving ideas of this wonderful range.

THE LEFT-OVER VEGETABLES

When you go to town with a wagon load of vegetables on an "off day" what do you do with the truck which you cannot sell? If you reduce the price in order to dispose of the vegetables the customer will expect you to do it again, and will wait for the customary drop in price before buying.

Some gardeners prefer to carry the produce home or even to throw it away, but this seems wasteful when we remember how many empty mouths there are in the cities.

Why not drive into the poorer quarter of the city, and there sell at a low figure to householders who would otherwise buy nothing? Or in small towns where there are no "slums" the gardener may earn the gratitude of some local charitable organization by leaving the last of his load at its back door. And while charity has its own reward this method of disposing of his wares will also be very good advertising with regular customers.

SOUND SHOULDERS

Here are the directions posted in the stables of a construction camp which uses 1,200 mules in a Southern State, as told in a recent issue of "Country Life in America":

Wash the shoulders and the back of every saddle and pack animal with cold water at noon and rub dry. If a "green" or young animal, add a teaspoonful of alum or a pound of salt to a bucket of water.

All collars must be scraped at noon and every particle of dirt and sweat removed.

For fresh sores, apply elder leaves boiled in a lard mixture.

BREEDERS' DIRECTORY

Our charge for inserting names in this Directory is $1.00 per year for each line under each heading. Money must be paid strictly in advance. Names taken out promptly when time is up Stamps taken.

FOR SALE.—Thirteen months old Guernsey bull, dam in advanced reg.—MRS. T.B.BLAIKIE, Great Village, N. S.

CANADIAN POULURY REVIEW, 39th year of publication. Bigger and better than ever. Departments conducted by specialists. Fifty cents year, three years one dollar. Sample free.—184 Adelaide St. West, Toronto, Ont.

LADIES TO DO PLAIN AND LIGHT SEWING at home, whole or spare time; good pay; work sent any distance, charges paid. Send stamp for particulars.—NATIONAL MANUFACTURING CO., Montreal.

FOR SALE.—A few choice White Plymouth Rock Cockerels, egg laying strain; also fine exhibition bred Black Spanish Cockerels and several Old English Pheasant Fowl Cockerels. Write W. C. BOTHWELL, Rothesay, N. B.

FILL YOUR OWN TEETH at home, painlessly, with Dentol Enamel. Will save teeth and money. Stops toothache. Will harden and form a permanent filling. Send for it now, 35c. "DENTOL ENAMEL," 233 Lancaster St., West St. John, N. B.

FOR SALE.—Six horse power gasoline engine, called the Big Six, new, only used three days, steady work, with saw stand and tilting table and twenty-four inch saw, also grain grinder, never used, will keep three men busy passing cord wood to saw. Write W. H. KELLY, George's River, C. B.

Fir Shade Farm Dual-Purpose Shorthorns !

Several years ago I imported from Ontario three Dual-Purpose Shorthorn animals, and now have in my stable at Rothesay eight representatives of this breed. Two of the females are entered in the Record of Performance, and so far have done excellent work. If you feel disposed you might drop in and see these the first time you are in the vicinity. Perhaps some time when you are coming to the city you would let me know, when I could arrange to go to Rothesay with you.
P. R. L. FAIRWEATHER. St. John, N. B.

The healthy animal, whether it be a calf, pig, colt or a chicken, should always be ready at meal time. The little fellows that are always willing to eat and are never over-stuffed with food do the best.

Name the farm and then live up to the name. Don't look for something poetic and sentimental necessarily. Make it a name that carries business significance as well as a little artistic value.

Overfeeding is as wasteful and extravagant as underfeeding. Feed a ration that will enable the swine to utilize all the nutrients to the best advantage.

Don't forget to hang up a few bushels of seed corn real early this fall. A little thought and time put to this at the proper time will save both money and disappointments. Hang it up where there is abundance of air.

After apples are picked they should not be stored where the dry air will blow on them. It causes wrinkles and toughness to come to them sooner than necessary.

The market hog attains his full growth when about six months old.

FOR SALE!
R. O. P. HOLSTEINS!

Two Bulls fit for service, sired by the "Champion" Holstein Bull of the Maritime Provinces. Dam of one gave over 11,000 milk and 500 butter in a year at 2 years old and the other is full brother to a 4-year-old show cow that made 468 lbs. milk and 20 lbs. butter in a week in R. O. M. and is now finishing a R. O. P. yearly record of over 16,000 milk and 700 butter at 4 years old. For full information and price write

The Maritime Illustration Farms

We have just received a copy of the 1916 report of the Committee on Lands of the Canadian Commission of Conservation, in which the selection and work accomplished on the Illustration Farms is outlined.

As a number of these farms are located in the Maritime Provinces our readers will be interested in the following extracts from the report.

WHY AND HOW SELECTED

The selection of the Illustration Farms and the work attempted on them grew out of the survey of farms conducted by the Commission of Conservation in 1911-12. In the main the survey was undertaken to discover existing conditions as to:

1. The fertility of cultivated farm lands and its maintenance, increase or decrease as the case might be.
2. The prevalence of weeds.
3. The other hindrances to profitable and successful farming.
4. The methods and systems in use in carrying on farming practice effectively and satisfactorily.

This survey included 885 farms in the Maritime Provinces, Quebec and Ontario, taken in groups of thirty contiguous farms, and each group chosen to represent a district of the province in which it was situated. A schedule was drawn up on which to record the information obtained by the visiting collector. The information thus sought and obtained uncovered many facts in regard to the systematic rotation of crops, the selection of seed grain, the sowing of clovers and grasses, the care and use of manure, the prevalence of weeds, insects and diseases, the distribution of labor somewhat equitably over the whole year, and many other minor points. As a result of the survey many striking instances of particularly good farming were brought to light; some farms emerged from the level of the others, not so much because of better soil, as because of better planning, better system, better methods and, above all, better management. From among the best of such farms in each group a selection was made of one to become the Illustration Farm for the locality.

THE HOE CROP IN THE ROTATION

Turnip and potato crop on a Prince Edward Island Illustration Farm; this splendid crop is the result of good cultivation and care.

WHERE THE FARMS ARE LOCATED

There are twenty-four Illustration Farms in Eastern Canada, eleven of these are in the Maritime Provinces, located as follows:—

Prince Edward Island.

J. M. McLean, New Perth, Kings Co.

Adam Brown, New Glasgow, Queens Co.

Albert Schurman, Central Bedeque, Prince Co., Nova Scotia.

H. M. Tattrie, River John, Pictou Co.

Vernon B. Leonard, Central Clarence, Annapolis Co.

Taylor Bros., Antigonish, Antigonish Co.

Scott McDonnell, Port Hood, Inverness.

New Brunswick:

Chester Keith, Corn Hill, Kings Co.

Kenneth Raymond, Bloomfield, Kings Co.

Shaw Bros., Victoria, Carleton Co.

Fred Vautour, St. Louis, Kent Co.

INTELLIGENT MANAGEMENT RECOGNIZED

The survey established the fact that on these farms some measure of care and intelligence was used in the selection of setd grain and some system of rotation of crops was at least partially followed. On the farms so chosen more satisfactory results, on the whole, had been obtained in crops and in profits than on most of the other farms in the group.

The farmers themselves, of each group, in conference with the Commission's expert, chose the farms in their communities upon which they could have illustrations of further improved methods of farminf. These when proved to be beneficial, were to be applied to all the farms in their districts.

The Illustration Farmer, thus chosen, received no salary. He did not become the beneficiary of the public through political patronage; but by the choice of his neighbors, he became their leader, whom they would willingly follow. They did not need to follow his vagaries, if he had a.y, in regard to philosophy, theology or politics. It was not necessary to consult church or party in selecting the Illustration Farmer. He retained his ownership and full control of his farm. At the same time he received Counsel as to systems of rotation and methods of cultivation, the selection of seed, the growing of clovers and grasses, etc.; but the general administration of the business affairs of the farm was controlled entirely by the Illustration Farmer himself. He received all the financial returns resulting from the better crops.

The illustrations benefited the community also.

THE COST OF CARRYING OUT THE PLAN

The Illustration Farmers were directed, or rather assisted, by expert counsel from the Committee on Lands for two years, taking the crops of 1913 and 1914. The Illustration Farmers did not receive any salary.

However, in order that results might bt reached without unnecessary loss of time, the Committee decided to grant a limited amount of assistance to each farmer to provide (1) a supply of seed grain of suitable varieties and of selected quality, (2) the quanities of clover and grass seeds recommended above those required at the rates per acre previously sown, (3) trials, on limited areas, of after-harvest cultivation, seeds, manures, etc. These costs amounted, on the average, to $78 per farm per annum. The cost for salaries and travelling expenses of the Commission's advisers amounted, on the average, to $165 per farm per annum. The expense of initiating the undertaking and getting the work started was more per farm than it need be hereafter now that information has been obtained as to what is necessary and advantageous.

In the spring of 1915 the place of the Committee on Lands, in carrying out the arrangements made for the three year period of 1913-15, was taken by the Dominion Department of Agriculture, through the Division of Illustration Stations of the Experimental Farms. The Committee on Lands released Mr. John Fixter, who had been travelling instructor for the Illustration Farms, to accept a position in that division.

The Agriculturist of the Commission visited each of the Illustration Farms once during the season of 1915. Full reports of the results of the season's work have been received from the farmers themselves and by the kindness of the Director of the Experimental Farms.

PLAN TO SUIT INDIVIDUAL FARMS

The plan of work for each farm was made to suit its conditions. The plan was made by the Illustration Farmer himself, in each case after conference with the Commission's advisers. The frequent visits made by the Commission's advisers assisted the farmer to modify the general plan of work and the methods of its application from time to time.

In general the scheme of co-operation between the advisers and the farmer included consideration of the following matters:

The planning, commencing and carrying on of a suitable systematic rotation of crops for each farm and its neighbourhood.

The sowing of the varities and strains of grain suitable to the farm and the district.

Different rates per acre to ascertain the most suitable rate of seeding.

The sowing of different amounts per acre of clover and grass seed, to ascertain the most suitable rate of seeding of both home grown and purchased seed.

The sowing of various summer pasture mixtures.

The practising of after-harvest cultivation, extra and more thorough cultivation to kill weeds, conserve moisture and increase yields.

The introduction of labour-saving devices and up-to-date machinery.

The care and economical use of farm-yard manure.

The encouragement of a farm garden.

Directly and indirectly encouraging many other means to make the farm more profitable, the farm life more satisfactory and pleasant, and to help to keep the young people on the farms.

After all, in an enterprise such as the Illustration Farms, the first test of success is: "Does it pay?". It is not, "Does it sound well, look well, and conform to certain theoretical principles?" but, "Does it pay?" Does it pay in crops and profits? Does it pay in the resultant fertility of the farmer's fields according to the farmer's own estimate? Has the plan resulted in the decrease of weeds and in putting them under control? Has the farmer been shown how to apply labor to more advantage and has he been able to secure enough labor of the right kind The answers to these questions can best be given by the farmers themselves.

The arrangement with each Illustration Farmer was to last until he had harvested their crops. By the end of the third year, that is, at the end of the season of 1915, the farmer gave his opinions and conclusions as to whether the plan had worked out satisfactorily.

Statements were received from twenty-three out of the twenty-four farmers who were doing illustration work. Twenty state they are now practising a more suitable and systematic rotation than they did before commencing work with the commission three years ago. Seventeen report having changed the plan of their farms or fields, to some extent, to enable them to more advantageously practise the rotation advised by the Commission's instructor.

Three farmers are not practising a more suitable and satisfactory rotation than previously for the following reasons:—

One had already been following a three-year rotation, has continued it, and it has proven a great success

Another has been practising a systematic rotation for the last fifteen years and is continuing the rotation which he found to be suitable.

Kenneth Raymond, has a small portion of his farm devoted to cereal crops and roots, while a large portion of the farm is on the river flat, which is givien up to the growing of hay. The same rotation which has been practised on the cultivated portion is being continued.

Every farmer who has improved his rotation system says that it has increased his crop yields. Several state that there has been an increase but cannot say how much, while twelve state a definite increase, the average of which is 19 per cent.

Twenty-one state their farms are more fertile and freer from weeds than before, while twenty-two say that the following of a definite plan makes their work more profitable and also much more interesting.

The following extracts from their reports indicate the extent of the resultant increase in the yield of crops per acre. While perusing these please bear in mind that at the beginning of this work these farmers were already among the very best in their localities.

Chester H. Keith (Corn Hill, N. B.): Increase 33 per cent.

Fred Vautour (St. Louis, N. B.): I can plan my work better than before. My farm profits are about 30 per cent better.

H. M. Tattrie (River John, N. S.): Increase 20 per cent. The increase in crop yield has been largely due to the amount of couch grass we have killed.

Taylor Bros., (Antigonish, N. S.): Farm profits are much greater than before.

Scott McDonnell (Port Hood, N. S.): Increase 25 per cent.

Albert Schurman (Central Bedeque, P. E. I.): Increase 10 to 20 per cent. The time has been rather short (three years) to see the best results.

Adam Brown (New Glasgow, P. E. I.): Increase 10 per cent.

Sixteen of the men stated that they had not been sowing the varieties and straws of grain on their farms to give best results, and eighteen say they are now sowing varieties more suitable to their farms and their neighbourhood.

Only three claim to have been sowing selected seed before beginning work with the Commission, while now every man is sowing selected or registered seed, and they state it pays them in bigger and better crops. All of the men say that good seed has become something of much greater importance to them than previously. This is something which cannot fail to have lasting and far-reaching results in each community.

Anet this subject:—Chester H. Keith says: "I am now sowing the best of seed, whereas I used to sow seed of inferior quality. This is one way the Commission of Conservation has helped, not only me, but a number of neighbours, in obtaining good seed grain."

Taylor Bros. say:—"We have been sowing selected seed for the past eight or ten years; on the average our yields have been fully 50 per cent greater than they were before."

The question of the amount of grain to sow per acre to get best results have not received much attention by the farmers, and many did not consider the condition when determining the amount. Thirteen stated they now know that the amount sown previously was not suitable, and have changed their rate of seeding. Every farmer says he has found that cleaned and selected seed does not require to be sown so thickly as uncleaned seed, and that soil conditions should determine to a considerable extent the amount per acre to be sown. A number had previously given this point indifferent consideration, but ten stated that they had not thought of this at all previous to the visits of the Commission's travelling instructor.

One Ontario farmer says:—"We have found that the richer the land the smaller is the quantity of seed needed, and where the land is poorer a heavier seeding is needed. We formerly seeded it all the same."

CLOVER ENRICHES THE SOIL

The corn on the left was planted on land on which corn was grown the previous year; that on the right was planted on land which grew a clover crop the year before.

SOWING OF CLOVER SEED

Only two of the farmers claimed to have been sowing their clover seed thick enough to ensure a good catch. Twenty-one had been sowing an average amount of six pounds to the acre, whereas they now sow ten pounds to the acre. Some had sown as low as three or four pounds, but are now convinced that ten pounds is better and are sowing it. Three farmers had previously grown their own seed while now twelve are regularly doing so.

Again an Ontario farmer says: "The high price of clover seed had something to do with our sowing a small amount, but since growing our own seed we do not mind sowing it heavier and find that the extra seeding more than pays for itself'.'

Another farmer, who had not previously grown his own seed, states that in 1914 he produced 500 pounds of alsike seed and 100 pounds of red clover, while in 1915, he grew over 1,000 pounds of red clover seed. The farmer doing illustration work for the Commission in 1914, grew 1,200 pounds of red clover seed and had never grown a pound of his own seed previous to commencing work with the Commission.

J. M. McLean (New Perth, P. E. I.): During the last two years the first crop of hay was always much better on the area sown with 10 lbs. clover and 10 lbs. timothy, while this year we have an unusual stand of clover in the plots heavily seeded. * * * We find the second crop is always much thicker and of a better quality after the thick seeding.

SUMMER PASTURES ARE HELP IN FEEDING.

Only three of the farmers had previously sown summer pasture mixtures, while thirteen now make a practice of sowing a piece for summer pasture, and all state that it pays to do so.

The summer pastures are a great help in feeding the cattle during the months of July and August, and the land is greatly enriched for the next crop.

Vernon B. Leonard (Central Clarence, N. S.): I tried the summer pasture mixture last year and will try it

again next year. I believe it an excellent way to carry stock through the dry season when pastures are short. I think the farmers of this country should practise this plan.

Five of the farmers had been practising after-harvest cultivation previous to the visits of the Commission's instructor, while since his visits twenty have been practising it. Eighteen state that it has helped to keep down weeds, and that it has increased their yields and the profits from their farms. Some of their statements follow:

Our experience with after-harvest cultivation has proven to us that it helps greatly in keeping down weeds and the land is in a better condition to withstand the drought the next year.

Following clover seed production and seeding, this is, in my opinion, the next most important illustration. We find it pays from every standpoint and, as proof that this part of the work has been noticed, many of the farmers in this district are demonstrating its value for themselves and the acreage is yearly increasing. Three years ago this was not done.

If one wants good crops he has to gang plough and cultivate after the harvest.

After-harvest cultivation was not practised in this community until three years ago; and now many farmers are doing quite a lot of it, and find it very profitable, for it mostly ensures a good catch of grass and clover, leaving the land porous and fertile.

Albert Schurman (Central Bedeque, P. E. I.): I notice a good many of my neighbours are taking up this practice.

LABOUR AND TIME-SAVING DEVICES

Eighteen of the farmers say they are making more use of labour and time-saving devices than before; fourteen are using wider implements; twelve are making more use of three and four-horse teams, while twenty state that they now plan and adjust their farm work to better utilize the help on the farm they did before. Some of their statements are:

"Having used a three-horse team I find that it is a decided advantage."

"We have arranged our work so as to be able to employ all our help by the year."

"We find that up-to-date and improved machinery and methods are profitable in all ways."

"When I have to renew my implements I get wider ones, for I think the wider implements are more successful."

Fifteen of the farmers state that they are now applying their farm manure in a manner to get better results than previously. Eighteen of the farmers are now exercising more care to prevent waste. Twenty state that they recognize more fully the value of the manure than they did before the visits of the Commission's instructor.

Twelve of the farmers stated they had always paid some attention to the garden, but eighteen say they are now paying more attention to the farm garden and find it pays them to do so.

Twenty-two of the farmers say they are now taking more interest in their farm work generally than before. Seventeen say their young people have become much more interested. Every man states he is convinced that it is necessary for him to try things on his own farm to see what is really suitable to his farm community. Twenty-two of the farmers state that their farm profits generally are greater than before. Here is what some of the farmers say:—

"The satisfaction of trying things out for yourself, and seeing results, is bound to increase a person's interest in his work, and the illustration work on our farm has shown us what can be done."

"While we have been working under the Commission we have found it a great pleasure to try out these illustrations, and the young people have taken more interest in the work on the farm.

"We find as the years pass the work more interesting and instructive; and believe that it has been productive of great good throughout the surrounding country. Besides scores of farmers have made enquiries and are deeply interested in clover seed production and seeding, which is also practically a new thing in this part of the country."

"The illustration work on the field at the road has called forth the attention of the community at large, and it has proved to them, as well as to ourselves, that a four-year rotation is a very profitable one. They stop to enquire how it has been worked and seeded and are trying to copy it as far as possible."

"During the past summer I observed that the public was very much interested in your Illustration Farms. I received many visitors and I noticed that my illustrations were profitable to all."

Fred Vautour (St. Louis, N.B.): I am more attentive to my work in every way. The young people have a garden of their own. My farm profits are about 30 per cent better.

Chester H. Keith (Corn Hill, N. B.): The illustration work done here is bringing good results in many ways. The farmers are sowing much more clover seed, and, instead of getting the cheaper grades, they are now buying the best. A number of farmers were quick to take advantage of the chance to get good seed grain which had been grown from registered stock. A number of farmers are doing after-harvest cultivation, something that had not been practised around here before. I find that what suits one community does not always suit another. I believe you have to find out, by trying, what is best suited for your own farm and the community in which you live, but I must say that in almost every case where we have followed the advice given by the instructor sent out by the Commission, things have worked out wonderfully well.

Vernon B. Leonard (Central Clarence, N. S.): I am fully persuaded that the work of the Commission has been a good thing for me. I have learned many valuable lessons, and I believe my neighbours have benefited to some extent too.

Albert Schurman (Central Bedeque, P. E. I.): Results: better seed, better cultivation and better prices from having a good article to offer.

Summing up his reference to these farms, Dr. James W. Robertson, Chairman of the Committee says: "Visits to some of the Illustration Farms, examinations of the records in detail, and consideration of all the reports from the Illustration Farmers themselves, have given me great satisfaction. Of the many movements for welfare of the farmers, and the advancement of rural life generally, in which I have had the good fortune to take part, I do not recall any single undertaking which has been more entirely successful in accomplishing the objects aimed at than this one of the Illustration Farms of the Commission."

LIVE STOCK ON AN ILLUSTRATION FARM

Soil fertility can be maintained by growing plenty of clover and keeping live stock on the farm.

WHEAT SMUT CONTROL.

Wheat growers in this country not infrequently experience serious losses caused by preventable diseases. Wheat is preyed upon by a number of parasitic fungi, three of which are classed as smuts. Two of these smuts are common pests in the wheat fields of North America; the other, commonly known as flag smut, is thus far unknown in this continent, though it is fairly common in Australia and certain other parts of the world where wheat culture has been in progress for centuries.

Of the two smuts, bunt or covered smut of wheat, sometimes referred to as stinking smut, is found wherever wheat is grown, sometimes resulting in losses to the farmers of the United States of $20,000,000 or more annually. Not infrequently fields planted to untreated seed and giving promise of yielding 30 to 40 bushels per acre of good wheat will produce a crop of covered smut amounting, in some cases, to as much as 40 to 60 per cent of the crop.

This smut disease is caused by a parasitic fungus which attacks the growing wheat plant before the first leaf appears above ground. Once inside the attacked seedling it continues its growth, and by the time the wheat begins to head the diseased plants produce a crop of smut. If we examine the heads of such a plant we find, instead of normal wheat grains, only a lot of smut balls. In other words, the materials produced by the living plant for the purpose of building up sound wheat grains have been consumed by the parasite in forming its masses of smut spores which finally occupy the exact position in the wheat heads that would have been filled by the kernels had they been allowed to develop. These smut balls consist of nothing but millions of spores enclosed in each case by a thin enveloping membrane. When the smut balls are crushed the spores give off an odor not unlike that of herring brine. The liberated spores become attached to the seed, which, if planted without previous treatment, may produce another crop of smutted wheat.

Treat Seed with Formalin.

Bunt or covered smut of wheat is one of the most easily prevented of any of the cereal diseases. The following procedure is recommended: Run all seed wheat through a fanning mill in order to blow out the unbroken bolls. This being done, the grain should be soaked ten minutes in a solution consisting of one pound of commercial formalin (obtainable at nearly all drug stores) added to forty gallons of water. The seed thus treated is next allowed to drain and is then piled on the floor and stirred frequently until sufficiently dry to sow. If during this process the kernels have swollen very much, the drill should be set to sow a little thicker, else the quantity sown per acre will be less than was intended.

Recent experiments have shown that in certain sections of the

Sussex, N. B.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

NOVEMBER 7, 1916.

DATES OF ISSUE.

November ..... 7—21
December ..... 5—19

POSSIBILITIES OF HIGHER EDUCATION

The improved financial condition in which many farmers will find themselves this fall should make higher education a possibility for many of their sons and daughters. The chief obstacle across the path of those who aspire to better education is the scarcity of help at home. This will undoubtedly bar some, particularly young men, from school, but will affect the ambitions of girls to a lesser extent. From among the catalogue of colleges and schools, no advice can be administered as to which will aid a prospective student in selecting that branch of education which will lead to the greatest ultimate success. Every individual has aims and aspirations for some particular activity, and this desire should be gratified, if consistent with good judgment.

The young man is to-day faced with the serious problem of deciding which is his greater duty—enlistment or school? This, again, is a personal matter, and we shall not attempt to solve it. But, dismissing that question, and supposing it to be a choice between going to an agricultural college or staying at home. What will it pay the young man to do? Individual circumstances, of course, must govern again, but in the majority of cases it will pay him to go to college.

Why? In farming, as in any other business, efficiency counts. Never before in the history of Canada has agriculture attained the position which it holds to-day. It is recognized as the most paramount of productive industries. Under the pressure of abnormal economic conditions, non-productive and unnecessary industries have been driven from existence; yet agriculture stands supreme. There is still an urgent call for greater efficiency in agriculture—better farming, better living and better business. This will be largely attained through better education.

Then too, an agricultural college training develops a "better man." It effaces the rough corners, develops one's individuality, as well as his social instincts, and fits him to become a better citizen in his community. The mere imparting of agricultural knowledge is not, perhaps, the greatest function of a college training. It is the bent of mind rather than the burden of mind—the faculty of seeing and thinking independently—that counts after all. What is developed in character is of more importance than what is drilled into the memory.

With out pursuing the argument too far, we say that in this age it is the trained man who succeeds, and farming to-day is more a work of skill and science than ever before. In what it makes of the young man in ambition, self-reliance and purpose, and in what it gives to him in technical knowledge and familiarity with the world of agricultural affairs, the college course is to be commended.

THE BREEDER'S OPPORTUNITY

The Nor'-West Farmer says:—There is ample evidence at hand to establish the claim that pure-bred live stock breeders are entering a period of unpresedented demand for their products. Before the coming winter is passed, there will be a dearth of good breeding stock, and several breeders will find themselves sold short. This will stimulate the inclination of many to fill mail orders with animals that are obviously unfit for breeding purposes. The demand of 1911, 1912 and 1913 had this effect, and the pure-bred industry, as a whole, suffered materially as a consequence. We have at hand the names of many men who have become permanentlp disgusted with pure-bred live stock through the unscrupulous tactics of certain breeders in such matters as furnishing pedigree certificates, delay in acknowledging correspondence and filling orders in a manner that betrays the confidence of the buyer.

It is time for a new standard of honor in this business. The opportunity to establish it is at hand. Because a breeder may receive a mail order for hogs, cattle or sheep, written by an individual in a remote portion of the country, in poor handwriting, and displaying ignorance of the business, does not justify such an act as sending this man an inferior individual that the breeder himself would not use. Neither does it justify any laxity in furnishing certificates of breeding. There can be only one correct standard for the conduct of this business. That is absolute integrity and business promptness. If the same courtesies are not extended by the purchaser, he can be held responsible.

Various live stock breeders' associations and record associations can well afford to devote themselves more earnestly to the protection of those who are financially interesting themselves in the pure-bred live stock business.

IS IT YOURS ?

One of the greatest assets any community can have is a well developed community spirit. The community spirit is the team spirit applied to larger units for the purpose of getting things that are worth while done. When a community works as a unit for the accomplishment of some worthy aim, that aim is as a rule soon realized. It is not an exaggeration, then, to say that one of the greatest assets of a community is a well developed community spirit.

Community spirit is something that can be developed. It is not something that just grows or comes down like manna from heaven. Its germ is usually an idea. This takes root in some mind. It spreads to other minds. If it spreads far enough, it takes in the community. Then you have the beginnings of a real community spirit. Let the people of a community agree on an idea, or ideal, to be realized, say, in the building of a new school, and let them through co-operation achieve their ideal; then they are ready for some other worthy enterprise. The idea of working together is taking hold. The main difficulty is to get community seed that will germinate. But the community spirit can be developed.

If the community spirit can be developed and is so great an asset, why not begin its development early? Why not make its development a part of our education? To do so would be to go out from the university equipped for efficient work and service in any line.

Why not develop the community spirit by working together as a unit?

By cultivating the community spirit here one will be the better able to help develop it in his home community.

In that there is a germ idea that may become one of the greatest assets of this community.

FIRST RULE IN GOOD MARKETING

Is to sell as much as possible in the market nearest you. Yet many towns and villiges have to import their fresh fruits, vegetables, some of their meats and even eggs or poultry, although located in the midst of a farming region.

This is all wrong. In the days of '49, the Californians who raised what the gold seekers consumed, got rich, while most of the miners went broke. Your local market may conceal a little gold mine for you. To keep down your own living expenses, make the farm produce more of what you can consume.

* * *

Never add warm cream to the cool.

* * *

To spend money on blooded stock and then fail to give it proper care is money wasted.

* * *

Keep the separator and its surroundings clean.

In caring for milk, cleanliness and cold are the two great essentials.

* * *

The question is not "What is the average production of the herd?" but "is each cow in the herd a profit-maker?"

* * *

Experience is the great teacher, but this does not mean that you have to try everything out yourself. The wise man learns by the experience of others.

* * *

Compulsory standards for grading laws appear to be necessary in order to bring about healthy, honest competition and protection to the progressive growers and to the consumer.

* * *

Don't forget the big Maritime Poultry Show to be held under the auspices of the Maritime Stock Breeders' Association at Moncton, N. B., on Tuesday, Wednesday, Thursday and Friday, December 12th, 13th, 14th and 15th, 1916.

* * *

If there is any truth in the statement that "charity begins and ends at home," then it is doubly true that community cooperation is a sacred duty on the part of every good citizen. Keep your money at home, where it will do the most good. You are undoubtedly interested in the groth and welfare of thecommunity in which you live, and it is safe to say that you would not willingly commit an act that might tend to retard its developement.

The Big New Brunswick Apple Show

New Brunswick's third apple show held under the auspices of The New Brunswick Fruit Growers' Association and The New Brunswick Department of Agriculture was staged in St. Andrew's Rink, St. John, on October 31st to November 3rd inclusive.

The New Brunswick Department of Agriculture has for several years been fostering the fruit growing industry of the province. The Fruit Growers' Association has been bringing the growers together from time to time for an exchange of ideas and to hear the last word on the various phases of fruit growing from practical men who have made a life study of the industry, and who are well able to give advise that materially helps the growers surmount the difficulties they encounter. Ever since the Horticultural department was organized, Mr. A. G. Turney, the official in charge and his assistants have been indefatiguable workers to place fruit growing in New Brunswick on the solid basis that the province's possibilities for the extensive and profitable pursuit of the industry warrant.

We have had the pleasure of visiting the first, second and third apple shows held in New Brunswick. We have also visited other apple shows in the neighboring provinces and we have no hesitation in concurring in the opinion, with those who are in a position to know, that the apple show just closed in St. John, was the largest yet staged in Eastern Canada.

A visitor, on entering St. Andrew's Rink, unless he or she was conversant with the splendid fruit growing possibilities of the province, naturally exclaimed, "where did all this fruit come from?" and on being told that every apple at the show were grown in New Brunswick, "Well, I had no idea so much good fruit was grown in the province."

From what sections of the province did the fruit come? was a question frequently heard. The reader who will take the trouble to read the list of awards published in this issue, will learn that the apples came from widely scattered districts in the province. The valleys of the rivers St. John, St. Croix, Kennebecasis, Belle Isle, Miramichi, Richibucto and the Petitcodiac and other districts in the province are eminently adapted to fruit growing, as testify the quantity and quality of the apples from these districts at the big show.

Staged on two inclined slopes against the rear end of the rink and facing the main entrance was an aggregate of 426 boxes of apples arranged according to varieties to give a good color scheme. Between the inclined slopes was a vertical panel, on the centre of which apples were artistically arranged to form a representation of the good old Union Jock.

Ranged around the flag were large maple leaf shaped pannels made of green, yellow, red and gold apples to represent these beautiful autumn leaves, one for each province and territorial district in Canada, and below all in the form of a semi-circle worked with small red apples the motto:—"Canada will never let the old flag fall."

Arranged on long tables in the centre of the rink were the plate exhibits in singles, fives, collections of six commercial varieties, best collections from various counties in the province.

Ranged on the left side of the rink were the barrels, boxes and baskets of the different varieties and on the right side the Advertising Booths' Exhibits of Apples, arranged by F. A. Hubbard & Son, Burton; B. F. Peters, Queenstown; Mrs. E. M. Darcus, Fredericton; W. B. Gilman, Fredericton; St. John Valley Nurseries, Brighton; W. P. & F. L. Fox, Lower Gagetown; A. R. Gorham, Gorham's Bluff; W. A. Colpitts, Mapleton; New Brunswick and British Colonization Co., Fredericton, and Harry Orchard, Whites' Cove.

On the left of the entrance was tastily arranged a splendid array of collections of home grown, preserved and canned, dried and pickled or put up in any way, intended to prolong keeping qualities for food purposes, fruits and vegetables displayed for competition by the Women's Institutes of New Brunswick. The Institutes taking part in this competition, and the number of jars in the respective collections were as follows, the first six in their respective order being the prizewinners:—

1. Sussex 58
2. Lower Millstream.....37
3. Florenceville 25
4. Lower Kingsclear.....43
5. Hopewell Hill.....14
6. Kennebecasis Valley.....35

Cody's, 14; Lake George, 23; Stonehaven, 34; Newcastle, 18; Minto, 11; Smiths Creek and Newtown, 24; Blackville, 28; Hartland, 7; Salmon Beach, 7; Poodiac and Jeffries Corner, 18; Hammond and Markhamville, 12; Albert, 18; Welsford, 28; Leverville, 20; B. N. Boyer, St. John, 12.

Close to the Women's Institutes' display was an array of bee keepers supplies, bees wax and honey and culinary products in which honey was one of the ingredients, surmounted by the admonitions "Eat Honey", and "Keep Bees."

The St. John Valley Nurseries showed some specimens of apple and ornamental trees and shrubs and a nice box of St. Regis strawberries, one of the Everbearing varieties. The luscious ripe strawberries picked in October looked well to us.

At the right of the main entrance was an attractive booth arranged by Mr. W. W. Hubbard, Supt. of the Experimental Farm, Fredericton, who is doing such good work in the development of that new experimental station which is destined to be of so much benefit to the farmers of the province who will avail themselves of the opportunity of keeping in touch with the experiments there conducted.

As a guide to the varieties of apples and the sections in which the respective varieties are grown in the province the reader can refer to the list of prize winners in this issue.

The first prize collections from the respective counties contained varieties as follows:—

Queens County—Grimes Golden, Bishop Pippin, Pewaukee, Fameuse, Ben Davis, Stark, Mac Mahon's White, St. Lawrence Golden Russett, Alexander, Baxter, McIntosh, Wealthy, Fallawater, Twenty Ounce, Ribston Pippin, Merritt, Golden Egg, Duchess, Canada Baldwin.

Westmorland County—Baxter, Wealthy, Stark, Greening, Scarlet Pippin, Colvert, McIntosh, Alexander, Ontario Wolf River, Duchess.

Albert County.—Wolf River, Alexander, Fameuse, Duchess, Canada Baldwin, Blenheim, Wealthy, Scott's Winter, Milwaukee, Baxter, Dudley, McIntosh.

St. John County.—Stark, Alexander, Gravenstein, Wealthy, Duchess, Dudley.

York County.—Golden Russett, Fameuse, Ontario, Alexander, N. W. Greening, Fallawater, Salome, Tolman, Baxter, Milwaukee, Wealthy, McIntosh, Mac Mahon's White, Dudley, Wolf River, Gano, Northern Spy, Ben Davis, Duchess, Pewaukee, Bishop Pippin.

Kings County.—Alexander, Bethel, Northern Spy, McIntosh, Pomme Grise, St. Lawrence, Red Gravenstein, Wolf River, Dudley, Gravenstein, Bishop Pippin, Ontario Hyslop, Grimes Golden, Duchess, King, Wealthy, Fameuse, Fallawater, Rolffe, and Seedling.

Sunbury County.—Scarlet Pippin, Tolman, St. Lawrence, Jennetting, Eureka Pippin, Colvert, Scott's Winters, Pomme Grise, New York Winters, McIntosh, Peerless, Dudley, Bishop Pippin, Ontario, Hyslop, Grimes, Golden, Stark, Wolfe River, Pewaukee, Fameuse, Baxter.

Gloucester County.—Ben Davis, Tolman, Baxter, Duchess, McIntosh, Wealthy, Alexander, Arctic, Wolf River, Betigheimer, Dudley.

Northumberland County. Scott's Winter, Gano, Hyslop, Haas, Winter Bough, Bethel, Wealthy, Blue Pearmaine, Queens Choice.

Charlotte County.—McIntosh, Fameuse, Stark, Alexander, Wolfe River, Ben Davis, Wealthy, Milwaukee.

Kent County.—Pewaukee, Ben Davis, La Salle, Mac Mahon's White, Wolfe River, Wealthy.

The best collection from any one farm in New Brunswick was shown by Cossar Farm, Lower Gagetown, and contained the following varieties:—

Grimes Golden, Ben Davis, Milding, Mc Mahon's White, Pewaukee, Fameuse, Eureka, Fallawater, McIntosh, Stark, Canada Baldwin, Golden Egg, Golden Russett, Merritt, Blue Pearmain, St. Lawrence, Winter St. Lawrence, Jennetting, Twenty Ounce, Baxter, King of Tompkins, Wealthy, Ribston Pippin, Red Betigheimer, Tolman, Alexander, Duchess, Dudley, Bishop Pippin, Max Codling.

The first prize for best six commercial varieties went to Mrs. E. W. Darcus, Lower Kingsclear on McIntosh, Fameuse, Dudley Winter, Alexander, Wealthy and Northern Spy. The best five baskets, one variety were five baskets of McIntosh Reds shown by Mrs. E. W. Darcus, as was also the sweepstakes prize for the best box, any variety.

The Advertising booths already referred to were encouraged by cash, aggregating $85.00, donated by: The New Brunswick Cold Storage Co.; Jones & Schofield; H. Horton & Son; Vassie & Co.; T. H. Estrabrooks Co., Ltd.; J. M. Robinson & Son; J. M. Humphrey & Son; Manchester, Robertson & Allison and $27.00 additional from the Provincial Government Grant. Campbell Bros., axe manufacturers, gave three of their best axes as special prizes. Then there were special prizes offered by the St. John Board of Trade, Senator W. H. Thorne, J. A. Likely, P. W. Thompson, A. H. Wetmore and J. A. Marvin.

The judges were Prof. W. S. Blair, Superintendent Experimental Station, Kentville, N. S.; C. W. Baxter, Chief Fruit Inspector for Eastern Ontario and Quebec; Prof. T. G. Bunting, MacDonald College; A. J. Logsdail, of the Experimental Farm, Ottawa; P. J. Carey, Fruit Packing Demonstrator for the Dominion and Geo. H. Vroom, Chief Fruit Inspector for Nova Scotia, all of whom had good things to say about the big show.

The apples were well grown, well colored, quite free from evidences of the ravages of fungus and insect pests, and in the majority of cases showed that considerable of care and intelligence had been exercised in the selection, handling and packing. There were a few instances where the packing was not up to the highest standard but as the growers are anxious to learn and are asking for instruction and practical demonstrations along this line, we look for improvement in the future pack.

Mr. Turney and his assistants worked faithfully and well to help the fruit growers stage their big show, and we have no doubt the result will be that consumers who visited the show will begin to enquire more than ever before for New Brunswick grown apples.

Following is a complete list of the prize winners and number of entries in the respective sections:

Class I.—Best Plate of fine apples.

Bishop Pippin—16 entries—1. A P Slipp, Upper Hampstead 2. F C and H G Smith, Long Reach; 3. A R. Gorham, Gorham's Bluff 4. W P & F. L. Fox, Lower Gagetown, 5. Alex P. Dumphy, Douglas.

McIntosh—27 entries—1. Mrs. E W. Darcus, Fredericton; 2. Cossar Farm, Lower Gagetown; 3. F C & H G Smith; 4. W. P. & F. L. Fox 5. J. W. Clark, R. F. D. 2 Fredericton.

Fameuse—30 entries—1. W. B. Gilman, Fredericton; 2. Cossar Farm, 3. F. A. Hubbard & Son, Burton; 4. H. B. Steeves, Shediac; 5. Mrs E. W. Darcus.

Dudley—22 entries—1. W. B. Gilman; 2. St. John Valley Nurseries Burton; 3. F. C. & H. G. Smith 4. Matthew P. Smith, New Bandon 5. New Brunswick & British Colonization Co.

Duchess—14 entries—1. Thos. A Clark, Chartersville; 2. W. P. & F L. Fox; 3. St. John Valley Nurseries; 4. Cossar Farm.

Wealthy—23 entries—1. St. John Valley Nurseries; 2, Mrs. E. W. Darcus; 3, Thos. A. Clark; B. J. Power, West Bathurst.

Alexander—22 entries—1, W. B. Gilman; 2, F. C. & H. G. Smith; 3 Mrs. E. W. Darcus; 4. Thos A. Clark.

Wolf River—25 entries—1. W. B Gilman; 2. Thos. A. Clark; 3. Rev Chas. H. Fullerton, Prince William; 4. F. C. & H. G. Smith.

Bethel—7 entries—1, F. C. & H. G. Smith; 2, Alex. G. Dumphy; 3 A. R. Gorham; 4, N. A. Sterritt, Grey's Mills.

Milwaukee—15 entries—1, J. E Holder, Lower Cambridge; 2. Thos. A. Clark; 3, Camber Bros., Springhill; 4, Rev. Chas. H. Fullerton.

Class II.

Gravenstein—9 entries—1, Thos. A. Clark; 2, F. C. & H. G. Smith; 3. B F. Peters; 4, N. A. Sterritt.

Ribston—9 entries—1, Thos. A Clarke; 2. Cossar Farm; 3, B. F. Peters; 4. Thos. L. Alexander.

King—8 entries—1. F. C. & H. G Smith; 2, A. J. Slipp; 3. B. F. Peters; 4. J. W. McKiel.

Golden Russett—18 entries—1, Cossar Farm; 2, Mrs. S. W. Darcus; 3, B. F. Peters; 4. Isaac W. Stephenson.

Northern Spy—12 entries—1. F. C. & H. G. Smith; 2. J. E. Holder; 3 W. B. Gilman; 4 Mrs. E. W Darcus.

Stark—13 entries—1. W. E. Armstrong; 2. Harry Orchard; 3. J. E. Holder; 4. Thos. A. Clarke.

Ben Davis—23 entries—J. R. Dykeman; 2, St. John Valley Nurseries; 4 W. P. & F. L. Fox.

Class III.

Princess Louise—4 entries—1, N. B & B. Col. Co.; 2, Isaac W. Stephenson; 3, Robert J. Shaw.

Blenheim—5 entries—1, Thos. L. Alexander; 2, N. A. Sterritt; 3, Robt. A. Smith.

Grimes—8 entries—1, F. C. & H. G Smith; 2, Mrs. E. W. Darcus; 3, W B. Gilman.

Baxter—25 entries—1, W. B. Gilman; 2, St. John Valley Nurseries; 3, Robert A. Smith.

Tolman—11 entries—1, B. F. Peters; 2, Cossar Farm; 3. Alex G. Dumphy.

Fallowater—7 entries—1. Cossar Farm; 2, W. B. Gilman; 3. Mrs. E. W. Darcus.

Ontario—12 entries—1, Thos. A. Clark; 2, Cossar Farm; 3, W. P. & F. L. Fox.

Lalome—6 entries—1. W. B. Gilman; 2, F. A. Hubbard & Son; 3. Isaac W. Stephenson.

St. Lawrence—7 entries—1, F. C. & H. G. Smith; 2, J. R. Dykeman; 3, Thos. A. Clarke.

Winter St. Lawrence—5 entries—1, Cossar Farm; 2, A. P. Slip; 2, J. E. Holder.

Canada Baldwin—9 entries—1, Thos. L. Alexander; 2, Matthew P. Smith; 3, Cossar Farm.

Mac Mahon's White—7 entries—1, Cossar Farm; 2, J. E. Holder; 3, Matthew P. Smith.

N. W. Greening—6 entries—1, Alex. G. Dunphy; 2, W. B. Gilman; 3, Alban Dionne.

Scott's Winter—7 entries—1, Isaac W. Stephenson; 2, N. B. & B. Col. Co.; 3, St. John Valley Nurseries.

Blue Pearmain—2 entries—1, J. R. Dykeman; 2, Cossar Farm.

Gano—9 entries—1, W. B. Gilman; 2, Rev. Chas. H. Fullerton; 3, St. John Valley Nurseries.

Milding—4 entries—1, W. B. Gilman; 2, Alex. P. Dunphy; 3, J. E. Holder.

A. O. V.—21 entries—1, St. John Valley Nurseries; 2, Thos. A. Clarke; 3, Cossar Farm; 4, A. R. Gorham; 5, W. B. Gilman.

Class IV.—Crab Apples—Best Plate of 12.

Transcendent—5 entries—1, Matthew P. Smith; 2, Alex. G. Dumphy; 3, Wm. A. Colpitts.

Hyslop—7 entries—1, F. C. & H. G. Smith; 2, Rev. Chas. H. Fullerton; 3, J. E. Holder.

Whitney—1 entrie—1, Thos A. Clark.

Any other variety—1 entry—2, Wm. A. Colpitts.

Class V.—Pears—Best plate of 5.

Flemish Beauty—3 entries—1, R. A. Snowball, Chatham; 2, W. P. & F. L. Fox; 3, B. F. Peters.

Class VI.—Collection of Apples, 5 of each variety grown in

Gloucester County—1 entry—1, B. J. Powers.

Northumberland County—2 entries—1, J. W. Vanderbeck; 2, F. Habermann.

Kent County—1 entry—1, Alban Dionne.

Westmorland County—2 entries—1, Thos. A. Clarke; 2, H. B. Steeves.

Albert County—2 entries—1, Robert A. Smith; 2, Wm. A. Colpitts.

Kings County—5 entries—1, F. C. & H. G. Smith; 2, A. R. Gorham; 3, N. A. Sterritt.

St. John County—1 entry—1, Wm. R. McFate.

Charlotte County—2 entries—1, W. E. Armstrong; 2, Frank Scott.

Queens County—5 entries—1, Cossar Farm; 2, W. P. & F. L. Fox; 3, A. P. Slipp.

Sunbury County—5 entries—1, F. A. Hubbard & Son; 2, St. John Valley Nurseries; 3, Thos. L. Alexander.

York County—4 entries—1, W. B. Gilman; 2, Mrs. E. W. Darcus; 3, New Brunswick & British Colonization Co.

Class VII.

Best collection of six varieties of apples, fine specimens of each, grown by exhibitor—17 entries—1, Mrs. E. W. Darcus, Lower Kingsclear; 2, W. B. Gilman; 3, A. G. Dumphy; 4, Cossar Farm; 5, W. P. & F. L. Fox.

Class VIII.

Best collection of apples, not necessarily the largest, grown on any one farm in New Brunswick, 5 specimens of each.—17 entries—1, Cossar Farm; 2, W. B. Gilman; 3, Mrs. E. W. Darcus; 4, F. C. & H. G. Smith; 5, W. P. & F. L. Fox.

Class IX.—Best box of Apples ready for shipment.

McIntosh—10 entries—1, Mrs. E. W. Darcus, Fern Hill, Fredericton; 2, Cossar Farm, Lower Gagetown; 3, W. B. Gilman, Fredericton.

Fameuse—9 entries—1, W. B. Gilman; 2, W. P. & F. L. Fox, Lower Gagetown; 3, F. C. & H. G. Smith, Long Reach.

Louise—2 entries—1, N. B. & B. Colonization Co., Fredericton; 2, I. W. Stephenson, R. R. No. 1, Maugerville.

Dudley—7 entries—1, W. B. Gilman; 2, F. C. & H. G. Smith; 3, N. B. & B. Col. Co.

Wealthy—11 entries—1, St. John Valley Nurseries, Burton; W. B. Gilman; 3, Cossar Farm.

Bishops—6 entries—1, W. P. & F. L. Fox; 2, F. C. & H. G. Smith; 3, Cossar Farm.

King—3 entries—1, F. C. & H. G. Smith; 2, B. F. Peters, Queenstown; 3, A. R. Gorham, Gorham's Bluff.

Ribston—6 entries—1, B. F. Peters; 2, I. W. Stephenson; 3, Cossar Farm.

Bethel—3 entries—1, F. C. & H. G. Smith; A. G. Gorham; 3, N. A. Sterritt, Grey's Mills.

Golden Russett—6 entries—1, Cossar Farm; 2, B. F. Peters; 3, W. P. & F. L. Fox.

Canada Baldwin—3 entries—1, Cossar Farm; W. P. & F. L. Fox.

Baxter—10 entries—Cossar Farm; 2, I. W. Stephenson; 3, W. P. & F. L. Fox.

Gravenstein—4 entries—1, F. C. & H. G. Smith; 2, B. F. Peters; 3, A. F. Gorham.

Northern Spy—7 entries—1, F. C. & H. G. Smith; 2, J. E. Holder, Lower Cambridge; 3, Mrs. E. W. Darcus.

Alexander—12 entries—1, W. B. Gilman; 2, F. C. & H. G. Smith; 3, Mrs. E. W. Darcus.

Tolman Sweet—5 entries—1, Cossar Farm; 2, B. F. Peters; 3, A. R. Gorham.

Any other variety—17 entries—1, F. C. & H. G. Smith; 2, Cossar Farm; 3, J. Meiklejohn.

Class X.—Best barrel of apples ready for shipment.

Alexander—9 entries—1, W. B. Gilman; 2, Camber Bros.; 3, F. C. & H. G. Smith.

Wolf River—11 entries—1, W. B. Gilman; Alex. G. Dumphy; 3, Camber Bros.

Dudley—8 entries—1, F. C. & H. G. Smith; 2, W. B. Gilman; 3, N. B. & B. Colonization Co.

Wealthy—2 entries—1, W. P. & F. L. Fox; 2, St. John Valley Nurseries.

Fameuse—5 entries—1, W. P. & F. L. Fox; 2, F. A. Hubbard & Son; 3, W. B. Gilman.

Bishop Pippin—5 entries—1, F. C. & H. G. Smith; 2, W. P. & F. L. Fox; 3, A. R. Gorham.

Bethel—2 entries—1, Alex. G. Dumphy; 2, F. C. & H. G. Smith.

Golden Russett—2 entries—1, W. B. Gilman; 2, B. F. Peters.

Ribston Pippins—4 entries—1, I. W. Stephenson; 2, B. F. Peters; 3, N. A. Sterritt.

Pewaukee—3 entries—1, W. B. Gilman; 2, St. John Valley Nurseries; 3, I. W. Stephenson.

Baxter—3 entries—1, F. A. Hubbard & Son; 2, J. E. Holder; 2, I. W. Stephenson.

Any other varieties—9 entries—1, F. C. & H. G. Smith; 2, T. Clark; 3, W. B. Gilman.

Class XI.—Best 8 Quart Basket of Apples

STORING APPLES TO PRESERVE THEM FOR WINTER USE

Many farmers have more or less difficulty in keeping apples, so that they will continue to be sound and palatable for any considerable length of time.

Everyone knows that there is a great difference in the keeping qualities of the various kinds of apples. This splendid fruit, like most good things, "has its day and passes away," but, while in a general sense this is true at the same time the life of good qualities of any variety of fruit may be prolonged for many days, weeks, or even months, according to the nature of the fruit and the methods of preservation. However, there is a limit to the profitable practise of extending the usefulness of any variety beyond its natural time, and especially is this true of the earlier varieties. Evidently nature intends them to last only for a short time, for they are soon followed by other varieties, and these again by others, until the end of the season, when firmer, naturally longer keeping varieties are produced. Since these are the last of the season, and with no more to follow, our greatest endeavor to prolong the usefulness should be with this class.

It is always desirable, as far as possible, to use apples in their natural season. No matter what system is employed to prolong their usefulness they are never quite so good as just at the supreme moment, even though they may be useful for some time after this. For instance, the Christmas holiday season will take all the Fameuse that are produceed at good prices, but you can hardly give the variety away in March or April. The Transparent is delicious in the harvest time, but no one will want it a month later. The McIntosh Red is one of the best in the winter, but the not be greatly in demand in the spring and the Ben Davis, which no one would look at in January, will be relished in June and July.

While the usefulness of an apple cannot be prolonged indefinitely, at the same time, by adopting the proper methods of preservation, overripeness, loss of flavor and decay can be delayed for quite a long time after the usual period of its passing. With this end in view, all bruised and broken specimens should be rejected. Defective apples will not keep by any method for very long, and no kind of defects are worse than bruises or broken skins. Prematurely ripe specimens should also be removed, as these will go before the general lot and cause trouble.

There is no general principal that will apply any and everywhere in the preservation of apples, and that is, to keep them cool. The lower the temperature, so long as they do not freeze, the better. There are several other importan matters, but this is an absolute essential. Another thing, they should be exposed to the air as little as possible. It is the practice of some to lay them singly on shelves. While by this method they do not necessarily decay, if kept cool, at the same time they will be damaged in texture by evaporation and injured in flavor by absorbing any undesirable flavors that may be present.

While it is practically impossible to preserve apples in their natural statc without changes, the process may be so retarded that they may be kept until other fruit begins to ripen, the following summer, which is as long as is desirable. The best way to accomplish this is to place them in as nearly an airtight box or barrel as can be secured and the lid or hed be closed up, which will prevent the air from evaporating them. If, in addition to this, they are individually wrapped in paper, it will be a still further precaution against decay, as experiments in this direction have shown. The paper has a good effect in keeping them from the air, preventing too close lying against one another, in case of decayed spots, in a measure prevents it from carrying infection to others and absorb moistures, keeping the fruit drier.

Apples should not be stored in a furnace room used for heating the dwelling, as it will be much too warm, inducing rapid ripening and early decay. Nor should they be placed in a cellar with many vegetables, unless as suggested previously, tthey be kept in air tight cases. Every cellar should be provided with a separate room shut off entirely from the other part so that the windows may be kept open when necessary and the temperature brought as near the freezing point as possible without injury.

In using from the barrel for home consumption only just what is needed for the present moment should be taken. Ripe apples placed on the table in a warm room soon loose that delicious flavor, cooling sensation and crisp texture which is so enjoyable in this excelsior fruit, when properly handled, but which rapidly becomes insipid and undesirable when exposed to unfavorable conditionns.

RED ROSE TEA "is good tea"

Reinforcements for Your Dairy

HOW about that old separator that you have been thinking of discarding for the past one, two, three perhaps five years? Don't you think it is time to replace it with some modern cream separator machinery? The "Made in Canada"

Standard

cream separator will bring reinforcements that you have needed for some time in your dairy to enable you to make a "drive" for larger cream profits.

It will bring to you a skimming device that Government Dairy Schools have tested out and proven to skim so close that only one-tenth of a pound of butter fat is lost in every 100 lbs. of milk skimmed. The Ontario Government's Dairy School Bulletin No. 206 considers the loss of one-half pound of butter fat good skimming. And there are machines that lose even as much as a full pound and more in every one thousand pounds of milk skimmed. Dear knows how much an old obsolete machine that has been in use for years loses. Certainly enough cream if it were saved to soon pay for a modern Standard cream separator.

The Standard also will bring to your dairy a real self-oiling system. This machine runs in a bath of oil, the reservoir only requiring to be filled three or four times in a whole year. This saves oil, keeps the machine in perfect running order, and means less attention required.

It will bring, too, a wide open bowl and discs that can be cleaned thoroughly in a minute. It will bring safety, for the Standard's gearing is all enclosed.

"Made in Canada"

It will bring other things, too—easy running, inter changeable capacity, low supply can, instantaneous clutch, flexible neck bearing, etc., etc.

But these are all described in our latest cream separator catalog. Send us your name and address and we will mail you a copy by return post.

DAIRYING.

MAKING PAYERS OUT OF SCRUBS BY FEEDING.... AND BREEDING

Cows of nondescript breeding and stunted in growth by scant and improper feeding can be made materially to increase in milk and butter fat production and to fill out and develop even after the age of maturity has been reached by proper feeding and attention. The second and third generation of the offspring from such cows and pure-bred bulls produce more than double the milk and butter fat of the original female foundation.

The scrubbiest kind of scrub cows were brought to the Iowa experiment station eight years ago, and they and their offspring have been under test and observation ever since to see just what correct care and feeding will do for them, and better breeding for the offspring. While not completed, the work produced valuable data to substantiate the above statement which hithero usually have been stated and generally accepted, but which lacked practical demonstration. Dairymen who have wished to build up grade herds have had no way of knowing their chances of success. Nor how long it would take to bring their herds to profitable production. They have not doubted the possibility of increasing milk yield by more liberal feeding, better housing and the use of pure-bred bulls but the big question has been, will it pay? The affirmative answer offered by the Iowa station is most comprehensive.

One scrub cow made an increas of over 102 p. c. in milk and over 86 p. c. in butter fat during her third year at the college dairy farm at Ames. A two-year-old Guernsey heifer made 131 p. c. more butter fat than the average record of her scrub dam under identical conditions. These are but two of the more outstanding results recorded to date.

The work was begun in 1907, when H. G. Van Pelt purchased 13 scrub cows and a nondescript bull among the back-country farms of Arkansas and brought them to Ames. They were thin in flesh, shaggy-coated and produced hardly enough milk to nourish the calves. Not a pound of corn nor a mouthful of silage had they ever tasted. Pure bred bulls were unknown in the community from which they came. They were about as poor examples of dairy type as could be obtained.

At the college farm they were given good care and management and were introduced to balanced rations, production records nd other modern improvements. They received their first taste of corn and ate their fill of good alfalfa hay. They were sheltered in a barn which was superior to the homes of some of their former owners.

They were mated with the pure-bred bulls at the dairy farm, and in the course of time their daughters were bred to pure-bulls.

The four-year old scrub cow mentioned above during her first year at the college farm produced 2742 pounds milk and 131 pounds butter fat. After three years of good treatment she produced 5556 pounds milk and 245 pounds butter fat, or an increase of 102 p. c. and 86 p. c. respectively. This was above the average rate of improvement, but in practically every case there was a marked increase in production.

The cows which were already aged at the time of purchase did not show a great deal of improvement after their first year, but it is certain that their performances were a considerable gain over their records before coming to the college farm. It is also of interest to note that the persisency of their output for a long number of years compares very favorably with that of the purebred cattle at the college. These figures show the latent productive possibilities of grade cows on our farms. Probably tthe most significant results of the experiment were the records made by the heifers sired by the college's pure bred bulls. On the scrub cows Holstein, Guernsey, Jersey, and later, Ayrshire bulls were used. These were not high-priced bulls beyond the means of the farmer, but were of good dairy breeding. The fact that many of the heifers have not as yet reached their prime prevents a fair comparison in some cases, for they undoubtedly will show continued improvement up to the years of their greatest production.

Some exceptionally noteworthy records have already been made by these half the threequarter grades. The greatest increase in production shown by any of the first generation grades is that of the Guernsey heifer noted in a preceding paragraph. As a two-year-old she produced 3451 pounds or 131 p. c. more milk and 179 pounds or 1136 p. c. more butter fat than the average record of her scrub dam. In this year she also made an increased profit over the best record of her dam of $24.48.

A Holstein grade of the first cross made 101 p. c. more milk and 53 p. c. more fat than the best record of her dam. Only one first generation Jersey grade has freshened up to the present time, and her average record at 2 1-2 years of age is 205 pounds or 20 p. c. more butter fat than was produced by her scrub dam at seven years old.

Improving the Young Stuff

The first generation grades are without exception much better in dairy conformation than were their dams, and this characteristic is still more marked in the second generation. There is a great improvement in constitution, capacity, mammary development, straightness of top line, quality and dairy type in every case except where the sire proved impotent.

In the Holstein cross, the breed markings did not show up particularly well in the first generation, but the heifers having three-quarters Holstein blood show the characteristic coloring and

A druggist can obtain an imitation of MINARD'S LINIMENT from a Toronto house at a very low price, and hav : it labeled his own product.

This greasy imitation is the poorest one we have yet seen of the many that every Tom, Dick and Harry has tried to introduce.

Ask for MINARD'S and you will get it.

conformation of their sires. These second-generation heifers are in most instances animals of exceptionally good dairy type for grades and bear little resemblance to their lean, poorly kept granddams that were brought from Arkansas eight years ago.

The results bear directly on the plans of farmers entering the dairying field, or who wish to bring a low-producing herd to a degree of production where they will pay for the feed consumed. Complete results will help decide whether to "buy in" or "grow in," whether to purchase high-producing, pure-bred cattle or to deevelop a herd of good grades.

The first plan is, no doubt, excellent for a man who has considerable capital and skill as a breeder and who seeks his profits in registered cattle. For the farmer who intends to make his living from the products of his cows rather thna from their offspring is commended the method of building up a herd of good grade cattle. The principle initial investment, according to Mr.Kildee and Mr.McCandlish,who have charge of the experiment, should be a good dairy bull. The figures show what canbe done with the poorest of scrubs and a reasonable priced bull of good breeding. independent and improved methods of management and feeding.

The demonstration has proved that dairying with a grade herd can be made profitable. Use the foundation of the cows already on hand, or which can be picked up in the community and a good, dependable bull, use intellgent methods of selection, weed out the non-producers by means of a testing association, feed well. The farmer then need not hesitate to enter he dairy business, for he can develop a dividend-paying herd in a comparatively few years.

DAIRY BARN PLANS

The time has passed when any sort of a building will answer the purpose as a shelter for dairy cattle. Today the work of the farm is in such a large measure centered in the dairy barn that the far-sighted farmer sees to it that this place is both sanitary and convenient. The time has passed when the work around the stables is looked upon as a mere chore, a task to be added to the day's work after 10 or 12 hours have been put in in the field.

Today the farmer appreciates that just as much of his profit, in fact, in many cases more of his profit comes from the dairy barn than from any other form of farm work. The question is now of arranging the stables,of planning the equipment, of organizing the barn work in such a way that he may get the largest reurns from the money invested.

Furthermore, the dairy barn houses perhaps the most expensive and valuable part of the farm equipment. There is no other place where from profit producing standpoint so much wealth is centered in so small a space. The dairy cow represents the greatest source of revenue on many of the farms, and it is because of this that the dairy farmer appreciates her significance and realizes that she must have the best of care if she is to make the best of profits.

There are men who make a business of planning farm barns. They outline and schedule the various things that are to enter into the dairy barn construction just as carefully and just as systematically as they would make a blue print of a city hall, a court house or a capitol building. The farmer's barn is no longer a structure that is started with a feew posts, sills and rafters. It is a barn that is complete in the mind of the architect and also of the owner before ever a board is bought or a nail driven.

Had such a thing as this been broached 25 years ago the man guilty of the misdemeanor would have been considered the laughing stock of the community. Why spend the moneny necessary for blue prints or plans for the service of an architect in making just an ordinary farm barn? There is no possible excuse for such an unwise expenditure or such foolish extravagance.

Today things are different. The dairy barn must be built so that when it is completed there will be no weak point, there will be no place that might be changed to the advantage of the work that is being carried on in the handling of farm stock.

The present systems of building are perhaps a little more permanent than when lumber was used exclusiveely, therefore it is especially important that the barn be arranged right before it is started. These few suggestions mark not only a change that has been made in the progress of barn building, but also the great steps in advancement that have been taken in farming generally.

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

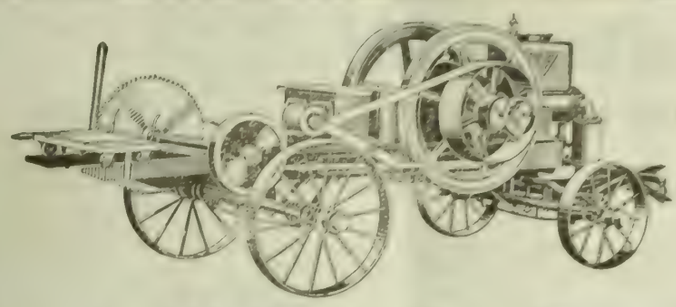
FLUSHING IN EWES

The propagandists of cheap mutton and wool have fallen by the wayside. A shortage of wool and mutton exists which is not likely to be relieveed in many years. It therefore behoves those who own flocks of ewes to handle them so as to obtain maximum results, fr the harvest will be rich, bountiful and enduring.

It is a recognizeed fact that the condition of the ewe flock during breed ing time is largely responsible for controlling the fertility. The condition of the ewes is a far more important factor than that of the ram. Of course the number of ewes that one ram can serve successfully must obviously depend upon his vigor. Flushing is the term applied to the practice of stimulating the organs of reproduction by supplying additional grain or more succulent pasture to the ewes. An insufficency of feed retards the breeding season, and reduces the fertility.

To flush ewes, Professor Wm. Hislop of the Experiment Station at Pullman, recommends that they be placed in a succulent pasture and fed one-half to one pound per day of two parts oats and one part bran for ten days preious to turning the ram in with them. It is equally important that the ewes be not over fat at this ime. All the wool about the dock of the ewes should be trimmed away beffre mating. As a means of distinguishing the ewes that have been bred, paint the ram on the brisket with some color which will leave a mark on the wool of the ewe. At the end of 21 days the ram should manner the owner is enabled to tell whether or not the ewes are "returning."



Look Well to the Power End of Your Sawing Rig

No part of a wood sawing rig should be more carefully scrutinized than the engine. It is the engine you must rely on to keep the outfit working.

Cold weather does not affect the steady, smooth running qualities of the Alpha. This is a great advantage as most of your wood sawing will be done during cold weather.

The carburetor and ignition system are entirely free from complicated parts. When you start your Alpha in the morning you can rely on it plugging away steadily all day. There is nothing to fuss or tinker with—not even batteries. The perfect control of the sensitive Alpha governor instantly regulates the engine to the varying loads that are always encountered in sawing wood. This feature and the great reserve power of the engine will keep the saw going steadily through big or little wood.

The above illustration shows one of our special steel frame mounted sawing outfits. Let us know what your requirements are and we will be glad to quote you prices and send description of a rig such as you wish.

STERILITY IN COW

I have a cow four years old, which freshened one year ago last april, and has been milking regularly since. I have breed three times, and still there is no sign of her being in calf. Can you advise me what to do?

R. M. R.

Answer:—About a day before the cow is expected to be in heat, take an ordinary yeast cake and soften it with a little warm water. Let this stand in a fairly warm place for 10 or 12 hours. Then add 1 pint of lukewarm water which has been recently boiled, and let it stand again for 10 or 12 hours more. Inject this into the vagina as soon as she comes in heat and breed her just as she is going out of it.

Occasionally the womb of a cow remains closed when in heat, which if it does she cannot get in calf. The remedy is to insert the hand into the vigina, after oiling the hand and arm with sweet oil, and open the womb with the finger. Have the finger nails cut close, so as not to injure the parts. The work should be done carefully, and made large enough for the two front fingers to enter.

In an hour after this operation. breed her.

Unless there is a diseased condition of the womb present, the trouble should be overcome by the use of one or the other f these remedies.

Had Severe Cold
ON HER LUNGS.

RAISED PHLEGM AND BLOOD.

Never neglect what at first seems to be but a slight cold. You think perhaps you are strong enough to fight it off, but colds are not so easily fought off in this northern climate, and if they are not attended to at once will sooner or later develop into some serious lung trouble such as bronchitis, pneumonia, and perhaps that dreadful disease, consumption.

Miss Kasye McDonald, Sydney Mines, N.S., writes: "Last winter I contracted a severe cold, and it settled on my lungs. I would cough and raise phlegm and blood. I had the cough for a month, and had medicine from the doctor, but it did not seem to do me any good. I really thought I had consumption.

My friends advised me to use Dr. Wood's Norway Pine Syrup, which I did, and it gave me great relief. I am very glad I used 'Dr. Wood's,' and would recommend it to every one."

You can procure Dr. Wood's Norway Pine Syrup from any druggist or dealer, but be sure and get "Dr. Wood's," when you ask for it as there are a number of imitations on the market, which some dealers may try to palm off on you as the genuine.

See that it is put up in a yellow wrapper; three pine trees is the trade mark; price 25c. and 50c.

Manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

LIVE STOCK.

THE PROFIT IN SHEEP

Many people do not understand the economic position of sheep sufficiently well to make the most out of ttheir farms. Sheep are ruminants, and especially well adopted to consuming roughages. They may be wintered, and wintered well, upon roughages alone. To be sure these must be protein roughages, such as clover, alfalfa, or pea hay, but many times there are waste feeds of this character on the farm that can be turned into cash. I have thus used to good advantage pea straw out of which the peas had been threshed. The crop thus yielded double returns, one for seed and another for the straw.

Growing wool requires a variety and a considerable quantity of mineral substances. Weeds are rich in minerals, and consequently much relished by sheep. There is nothing else quite so good for sheep as weeds for a part of their ration. The farmer who has weedy hay or weeds on his farm can oftenturn those to profit by the sheep route.

The shelter and labor required for sheep are less than for any other class of farm animals. The protection from cold afforded by the wool makes warmth in the sheepshed an unnecessary consideration. The sheep is economical in its water consumption. It passes a manure that is relatively dry and does not need much bedding. One or two cleanings of the sheep shed per season are sufficient. Feeding and watering are done for groups and so can be accomplished with a minimum of labor. If sheep are properly bred and fed, the lambs come strong and can largely take care of themselves, so that not much extra attention is necessary at lambing time.

In the sale of sheeep and their products a dual-purpose idea is involved. Horses are raised for the work they furnish, dairy cows for the milk they give, beef cattle for the meet one can get from them,and hogs for the amount of carcass they will yield, but with sheep the carcass and the wool are equally important. The lamb, however, is the most valuable product of the sheep industry.

With a good farm flock the lamb dropped in the spring will within 6 months equal the live weight of the original flock. This can be done on pasture, the cheapest or all feeds, and with the minimum of labor. This cannot be accomplished with any other roughage-consuming animals of the farm. When one stops to consider that the winer feed at least can be taken care of from the sale of wool, the source of profit in sheep can readily be accounted for.

With hothouse lambs the possible profit in sheep is still greater. Sush lambs can within 3 months be made to equal two-thirds of the live weight of the breeding dams with the consumption of a little extra feec Furthermore, the price at which lamps like this sell is greater than can be obtained for any other animals of the farm. These often outsell poultry. Taking all things into consideration, a farm flock of sheep properly managed is one of the most profitable investments a farmer has.

SHEEP MANURE VALUABLE

Sme time last winter a man from Maine wanted me to tell how I would manage to make 50 or 60 loads of manure from 75 sheep in a year. The most of the farmers around here who keep sheep let them run in the pasture in the fall until the snow gets so deep that they cannot paw through to the ground. Thenn getting to the barn they have the corner of a wagon house or manure shed for shelter with no bedding, are fed in the corner of fences or buildings. If they have racks they are outdoors. The sheep spend a larger part of their time out in the yard under these conditions. They do not save much manure.

I am no advocate of the open shed theory for sheep. My barn is double boarded and sealed with matched boards inside. There are windows and ventilators that are opeen in common winter weather and the door is open into a yard when it does not storm. But when the themometer is 20 below and the wind blows a gale the sheep seem to enjoy having the doors and windows shut.

My feed racks are in this barn. I bed thesheep with oats straw butts that come from the racks. In regard to the amount used you will soon learn by experience how much. If you use too much the manure will heat, if not enough the pen will be wet. I keep this pen comfortable enough so that the sheep spend most of their time inside. Every sheep will go out into the yard many times in a day, but they will eat and lie in the barn and when a sheep gets up the first thing is to relieve the bladder and bowels. so the manure is all in the barn. Quite a large part of the fertilizer from a sheep is the liquid.

My sheep begin to come to the barn nights in October when the fall storms come on. In fact, they come to the barn nights all summer when there are big storms. I have a dog-proof yard near my pasture bars where my sheep stay nights. When I go after my cows at night I shut them in and let them out in the morning when I turn my cows out. When there is a storm coming I find my sheep waiting at the bars that lead to the barn Other times they will be in and around the yard in the pasture. I have read that cattle on the plains will become restless and stampede before a storm Sheep certainly know when there is a storm coming.

In making this estimate I do not figure on manure that I made through the summer with the bedding I use in the winter. The manure soon gets to be from 1 to 2 feet deep in the pens and I have to draw some out or bump my head on the outlays. What I draw out through the winter I put in a pile in the field and mix it with manure from the cow barn at the rate of one load of sheep manure to two loads of cow manure. This keeps it from heating and makes a fine combination for any kind of crop, particularly for corn.

What I have left in the pen in the spring I use for potatoes. Now that potash is not to be had there is notthing that takes the place of sheep manure for potatoes.

There is a man in this town who keeps a pair of horses, onee eor two cows, the rest of his stock being sheep, and he has been for years. He buys practically no fertilizer and but a very little grain. His farm is always in a high state of cuultivation, cuts two crops a year. But I will admit that this is an exceptional case. He has around 15 acres of very heavy natural grass land with a large amount of pasture that runs back on the hills. Practically all the dairy farmers around here buy immense amounts of commercial fertilizer and draw home a two-horse load of western grain every time theey go to a village. They should raise sheep.

IT PAYS TO TEST.

As to whether or not official testing pays, there should be no question. If it don't pay, then there must be something wrong with the owner—not the cow, for she is proving she is all right—not the system, for it is practically right in every way.

Why keep registered cattle if they aren't going to be given a chance to demonstrate their worth? Just as well keep grades, or any old thing. Make the registration count for something more than just the pedigree, and then there will b no chance for outsiders to say that registered cattle are no better than grades.

It pays to test. No puestion about it and here are a few reasons plainly told by a well known Jersey breeder.

"To my mind, Register of Merit testing helps in very many ways. First of all, it gives the owner and manager of the herd an absolute accurate recrd of what the cows are capable of, and it gives it in a more certain and authoritative manner than by private testing. Then it stimulates greatly, I believe, he interest of the herdsmen and milkers, which is a very appreciable advantage, also s n incentive to improvement nnd advancement in breeding its effect is most benefical. After all, the value of a cow is in her ability to produce and reproduce, and accurate testing goes far in measuring this value.

"As far as theactual and immediate financial value of testing goes,I think it pays and pays well. I know it does my own case and believe it will pay practically in all cases. Nearly all breeders wish to sell a certain number of bull calves and I find that buyers are fast becoming very careful in scrutinizing the record of the dam, in fact, I believe it will very soon be almost impossible to sell a bull calf from any but tested cows and it is real Register of Merit records they will want, not private tests."

WAS THE CREAMERYMAN DISHONEST

"Why is it one of my cows only tested two per cent according to the creameryman's test, yet she raises me the best, fattest, and sleekest calves of any cow I've got?" asked a dairyman at a recent dair meeting in northern Indiana.

"I see nothing wrong in that coincidence," repled the speaker who had been explaining why cream tests vary, and had the statement that the dishonest creameryman was an exception rather than the rule.

The idea that the richer the milk, the better it is for raising calves, and that skim milk is little better than water is a very correct yet common conception. A great many valuable calves have been lost with the scours because they were fed milk that was ttoo rich in fat. The calf only needs about two per cent of fat in the milk or in its ration to .meet its requirements. The surplus fat is not used by the calf's system, but by a digestional process is made into a kind of soap, being similar to the process our grandmothers followed in making home-made soap. Many progressive dairymen throughout the state who are compelled to raise their calves on whole milk are very careful to furnish the calves milk from their cows producing the thinnest milk. They are much more successful by this method than by any other.

The most economical feed for calves is skimmilk, with a grain mixture of corn and coats, allowing access to alfolfa or clover hay. M any have the impression that skimmilk is little, if any, better than water, but the truth of the matter shows that skimmilk contains all of the original food nutrients which promote growth and vigor. All hat separation has removed out of the whole milk is the butterfat. as shown in the following analysis The same amount of fat that is necessary be supplied by a small amount of the ground corn and oats. These feeds have given not only better but more economical results than any of the other grains in the various feeding matrials in the past.

How many hairs has a Bear ?

We doubt if the average person in Canada who sees [illegible] has any real idea of their number, their length, their fineness and warmth. But it is [illegible] of the great importance of hairs per square inch to produce fine warmth and softness.

The actual number of hairs on any given area can be actually determined by mathematics and an abundance of patience.

We have cut a piece out of a bear's hide, one inch square in size—have sealed and deposited it with the bank and are giving

$300.00 IN PRIZES

to the 64 persons who are nearest correct in their estimate of the actual number of hairs on that one square inch of black bear skin.

This contest is entirely free to every one who complies with the conditions, and we might frankly state that the sole object of this contest is to familiarize as many people in Canada as possible with the wonderful bargains they can secure in stylish guaranteed Furs and Fur garments, through Hallam's system of dealing direct "From Trapper to Wearer"

THE HORSE

BREED IDEALS AND SOUNDNESS

In the development of each breed of draft horses the direction of selection and improvement has been governed by definite ideals. Sometimes the ideal has been realized through the constructive work of a single breeder or group of breeders, as, for example, in the influence of M. Jules Hazard on the modern Belgian. Sometimes the ideal has been the outgrowth of the minds of breeders in general, as in the Clydesdales or Suffolk, where no man towers preeminently as a constrctive breed builder and the small farmer vies with the great export producer or stallion owner as a breeder of quality animals. Again the ideal may be the result of a particular market demand, as in the case of the American demand for Percherons.

The report of the ten states publishing the nature of the unsoundness in their public service stallions offer an opportunity for a study of the effectiveness of each of these methods. Of course, in the final analysis, each breed is being produced ultimately to meet market demand, but some breeders have held more fixedly to an ideal of what futur market demand will be, while others have catered to market vagaries and the extrems in popular favor. On the other hand, the breeeds that have made the greatest effort to respond to export desires have had a breederswhose steadfast purpose has carried their studs constantly forward, as, for example, when market demand veered from the dumpling "Dutchmans" type, to the stretchier, heavier-framed modern draft. Hence no breed ideal can be classed purely as any of the three types mentioned, but ach is only predominantly of one group.

The ultimate function of the draft horse is draft power. The strength of the pull exerted depends on the muscle power, the bone leverage, and the weight of the horse. In addition his efficiency depends in part on the rate at which he can move loads and, for farm work, his general activity. The lowest blocky "Dutchman's" type that first found popular favor in America represented the ultimate in leverage, muscle power, and weight, in proportion to its bony framework. On the other hand this type of animal lacked in activity and ability to move loads rapidly. The correction of these defects developed the taller, stretchier drafter whose type in part corresponds to that product of constructive American breeding, the Standardbred. Of the modern breeds the Percheron, French Draft, Belgian and Suffolk tend toward the blockier ideal, while the Shire and Clydesdale approch the ideal of the active animal.

As the relative proportions of the different kinds of unsoundness indicate where a breed ideal fails under service , and the absence of particular unsoundness reveals the strong points, the following table, based on the specified unsoundness in the 10 stallion board reports is of interest. Since infectious diseases and most anatomical defects are not the result of severe work but are due to inborn causes, they are ommited from the table. Futhermore, no unsoundnesses are reported in the 31 Suffolks so they are also ommited.

Percentage of each unsoundness on basis of total specified unsoundness in each breed.

Breed	Percheron	Belgian	French Draft	Shire	Clydesdale
Sidebone	33.1	45.1	30.4	27.6	40.0
Bone spavin	9.7	6.1	10.9	6.7	0.0
Ringbone	2.7	4.9	6 5	0.0	0.0
Curb	1.3	1.2	0.0	0.0	0.0
Thick wind	18.7	18 3	13.0	27.6	10.0
Heaves	0.0	1.2	0.0	3.5	20.0
Blindness	9.0	8.6	19.6	13 8	10.0
Bog spavin	8.4	4.9	10.9	6.9	0.0
Thoroughpin	0.3	1.2	0.0	0.0	0.0
Springhalt	2.0	0.0	2.2	3.5	0.0
Chorea	2.0	1.2	0.0	0.0	0.0
Navicular disease	0.3	0.0	0.0	0.0	0.0
Other specified unsoundness	12.5	7.3	6.5	10.4	20.0
Actual No.of specified unsoundness	299	82	46	29	10
Number of each breed	11,193	2,798	1,540	1,263	782
Percent of breed specified unsoundness	2.67	2.93	2.92	2.29	1.27

In examining the preceding table one must not regard the percentage between the different breeds on a particular unsoundness as indicative of which breed is most liable to that unsoundness. The percentage here simply indicates within each breed the relative probability of a given probability of a given unsoundness appearing, providing the breed becomes unsound at all. The opportunity to compare the different breeds on particular unsoundnesses was afforded in my article on "Breed Predispositions to Unsoundness."

The Clydesdale and the Suffolk have been subjected by their breeders to selection toward a common ideal. Apparently this kind of breed building is most effective for the production of animals to withstand service, as there are fewer weak links in the chain of draft power in these two breed than in all others. The Suffolk shows weakness at no points so far as service is concerned, although its numbers are too small to be significant. According to the table the Clydesdale exhibits weakness at 4 points, the Shire at 7, the French draft at 7, the Belgian at 10, and the Percheron at 11. Of course, these points have no particular significance when only a single case occurs, hence it is important to know in how many significant points the breeds fall short. On this basis the weak points in the Percheron are the feet, the hocks, the wind and the eyes, with a significant deficiency in quality as evidenced by bog spavins and thoroughpins combined. The Belgian evinces trouble of the same nature, as does the French draft with bad ankles added. The shire shows less tendency to puff joints, while the Clydesdale has a clean bill of health both in strength of hocks and in quality.

If one point stands out clearly here, it is that the fussiness of the Clydesdale breeder in regard to feet, legs, and action has its reward. While of the specified unsounndness in the Clydesdale, sidebone is the most common,yet it is really even less frequent in this breed than in any other major breed, only one animal out of every 158. This is meerely another means of emphasizing the thoroughness with which a general breeder's ideal can improve a breed.

Perhaps the most significant fact of all is that the real weak spot in all of the draft breeds is in the foot. If a draft horse is to become unsound the chances are from 1 out of 2.5 to 1 out of 4 that the foot will go first, and sidebones be produceed. The next most, valuable point is the wind when all breeds are considered, but, the chances range from 1 out of 3 to 1 out of 8. After that the eyes seem weakest, the probability being from 1 out of 5 to 1 out of 12.

It seems difficult to understand why the heavy horse, whose foot never receives more than two-thirds of the jar which the racers foot gets, fails so signally at this point. That it is not related to breed peculiarity in shape is evidenced by its frequency in each breed, nor does texture of the horny wall seem to be related to it. One can appreciate the difficulties in the wind, the thick wind of the continental breeds and the Shire doubtless being related to overfatness while the heaves of the Clydesdale may be related to its less capacious punch and its greater activity, which might produce pressure on the lung nerves with the resultant paralysis. The blindness appareently is more or less sporadic. No blindness due to recurrent ophthalmia (moon-blindness) is included, hence one may consider the blindness to be the result of hereditary causes more or less independent of the other conditions of the breed or body.

It is easy enough for anyone who is a breed partisan to find food for his partisanship in the figures that have appeared in this article and in the four articles preceding, but two things stand out preeminently, even to the impartial observer, immense popularity of the Percheron in the leading horse producing states of America, and the remarkable efficiency of the Scotch method of horse breeding, which has produced the Clydesdale, a breed so free of unsoundness and so durable in quality. Furthermore every evidence should demand further inquiry into the Suffolks.

Kansas Agricultural College.

HOW TO MANAGE A RESTLESS HORSE.

A correspondent asks how to break a horse from the habit of pawing in the stable and in front of the hitching post.

Secure a piece of wood a foot in length and 2 to 3 inches square. To the centre of this securely fasten a strap about 15 inches in length. Buckle this device about the knee of one of the horse's front legs permitting the bock to hang down free about 10 inches below the knee. When the horse paws, this piece of timberdangles around the animals legs and strikes against them in propertion to the fierceness of his pawing. This device must be applied repeatedly until the bad habit is broken. When first putting it on care must be exercised not to shy the animal.

To make a horse stand while getting into the rig, first make the horse understand and obey the word "whoa."

TOTALLY DISCOURAGED BY NERVOUS PROSTRATION

After Many Weeks of Doctoring a Friend Recommended Dr. Chase's Nerve Food, and She Was Cured.

There is nothing more discouraging than Nervous Prostration. Because of the exhausted condition of the nervous system, weakness and helplessness take possession of the body. The faculties of the mind as well as those of the body are affected and hope and courage disappear.

The patient, often appearing well, gets little sympathy, and few doctors understand diseases of the nerves well enough to treat nervous prostration intelligently. Dr. Chase's Nerve Food is founded on the prescription of a great nerve specialist, and hence its wonderful success in curing ailments of this nature.

Mrs. Edith May Williams, Tillsonburg, Ont., R. R. 3, writes: "I cannot speak too highly of Dr. Chase's Nerve Food. I suffered for years with my nerves, and at one time I was confined to my bed with nervous prostration for several weeks. I cannot just explain my feelings, but I was weak and helpless and so discouraged and despondent that I thought I would lose my mind. I doctored with several doctors and received but little benefit. At last I became very much discouraged and thought I would never get better. A friend advised me to try Dr. Chase's Nerve Food, and before I had finished the first box I knew that it was helping me. It took several boxes of the Nerve Food to make me well and I can truly say that it is a wonderful builder-up of the nervous system."

It is only wise to prevent such dreaded diseases as Nervous Prostration, Paralysis and Locomotor Ataxia by keeping the nervous system in good condition at all times. When you cannot sleep well, have headaches and indigestion, be warned of approaching dangers and restore the nervous system by using Dr. Chase's Nerve Food. 50 cents a box, all dealers or Edmanson, Bates & Company, Limited, Toronto.

Had Weak and Dizzy Spells.

WAS CURED BY MILBURN'S HEART AND NERVE PILLS.

Mrs. J. S. Nicholls, Listowel, Ont., writes: "I was weak and run down, my heart would palpitate, and I would take weak and dizzy spells. A friend advised me to take your Heart and Nerve Pills, so I started at once, and found that I felt much stronger, and my heart was ever so much better in a short time. I cannot praise your medicine too highly for it has done me a world of good. My husband has also been bothered with heart trouble ever since childhood, and finds quick relief by using your valuable pills."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years, and are universally known as the very best remedy for all troubles arising from the heart or nerves.

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

POULTRY.

HENS CHOOSE OPEN-AIR HOUSE

By remodeling our henhouse several years ago, our winter egg production has been merely doubled. Air and sunshine were admitted and the hens were as happy as when they were scratching in the garden, or catching grasshoppers, consequently the egg basket was well filled.

The first time I ever read of an open air henhouse, I decided it was as nearly perfect as it could be. Many times I have been in the henhouse in the winter and noticed the windows heavily coated with frost, due to the excessive moisture. The hens had a dejected appearance, and were huddled in a corner where a ray o fsunshine filtered through. I suggested to my father than we change it into an open-air house, but he laughed and said he thought it was open-air enough, that the hens would freeze if the windows were removed.

I did not say any more about it until the next summer. After having, I was not working, so I thought it would be a good time to do the job. My father's consent was won because his mind had been changed accidentally in regard to the matter. This is how it happened. One day about the middle of February some of the hens were in an open shed, a heavy snowstorm came on, preventing them from going back to the henhouse. In the morning finding them scratching in some litter that was in the sunshine, he could not help noticing the difference, when feeding the others, in their appearance.

The night had been one of the coldest of the year, so he decided to let them stay there and try out the open-air idea to the limit. None of the hens had laid any eggs during the winter, so he thought they could do no worse there. I can imagine his surprise on looking into the box he had put out for a nest, and seeing a nice brown egg, a month before those in the henhouse had laid an egg.

HOW THE JOB WAS DONE

I removed the window sashes and hinged on frames covered with canvas. These could be easily raised and hooked to the top of the house. A roosting platform was made3feet above the floor, about 5 feet wide and 6 feet long. This was boarded on the sides tightly, so as to prevent drafts on the fowls when on the roost. A curain similar to those in the windows was constructed toclose the closet at night.

Two ventilators were made just above the curtain to provide air when too warm, or too close. The walls were made double annd stuffed with hay. In the room itself drafts were prevented by having all the walls tight except the front, and the bulkhead under the openings was made 3 1-2 feet high, to prevent the wind blowing directly on the hens when working on the floor.

Litter a half foot deep was kept on the floor all the time, in which all grain was thrown so as to make the hens keep at work. There has not been a sick hen in this house for the last two winters, and we have had eggs every day. Twenty-two hens were kept in this house the first winter, and each hen averaged nine eggs during the month of January, about the same iu February, and 12 in March.

These hens had no extra care, they had no warm water, no warm mashes were fed. Dry mash, composed of wheat bran, corn meal, cottonseed meal, middlings and ground oats was kept before them all the time, as was water, oyster shells, grit and charcoal. Oats, wheat, barley and crackeed corn were fed three times a day. Meat and bone were fed two or three times a week. For green food, turnips, beets and cabbage were fed daily, hung on a nail to make the hens exercise. We can truthfully say that this open-air henhouse has proved entirely satisfactory.

PREPARING FOR WINTER EGGS

During the past summer when our flock of 400 hens and pullets had the run of orchard, meadow and grain stubble they consumed less than 100 pounds of meat scrap per month though they had access to it all the time. As the supply of bugs, worms and grasshoppers decreases with the coming of fall they find less meat in the fields and go oftener to the meat scrap hoppers, and with the appearance of cold weather they will have to depeud entirely on these hoppers

(Continued on page 72)

Are your hens winter layers?

The time to prepare for winter eggs is during October, November and December. Have your hens get over the moulting season early and enter the winter months healthy and vigorous. This you can do by feeding **Royal Purple Poultry Specific**, put up in four sizes, viz.: 25c, 50c, $1.50 and $5.00.

Use **Royal Purple Roup Cure** in the drinking water to prevent and cure diseases—25c tins only.

Royal Purple Lice Killer—the hen's best friend and the worst enemy of lice. It smothers them and will permit the hen to sit comfortably on the nest to lay her eggs. It is made from the flowers of an Oriental plant which we grind to the very finest powder. Guaranteed. 25c. and 50c. a tin.

Thoroughly disinfect your hen houses with **Royal Purple Disinfectant**—put up in three sizes, 25c, 50c and $1.00. For sale by our dealer in your town.

Free—We will send **absolutely** free one of our 80-page illustrated booklets on the common diseases of stock and poultry. It tells how to prevent and cure diseases, describes fully our **Royal Purple Calf Meal** and tells how to raise calves without using milk if necessary. This book is given free, no postage required. Write for your copy to-day. Dept. H

SNAPPING TURTLE SOUP COMPANY

Melly had passed the age when a boy habitually accumulates frogs, garter snakes, young squirrels annd other possible and impossible pets. Therefore Miss Kate Derby, as she watched him from a rear window of the kitchen one morning late in the spring, was greatly puzzled by his action.

He had put a large wooden bucket, which had a board for a cover, into the angle between the carriage house and the barn. Into that bucket he seemed to be thrusting a number of small objects, which he was taking one by one, very gingerly, from his pockets. Apparently the objects were alive, for every time that Melly thrust one into the bucket he raised the cover and clapped it down with remarkable suddenness.

Miss Derby rapped sharpely on the window. Springing up, Melly glanced behind him with an air of alarm.

"What are you doing?" his aunt demanded.

'How you startled me! When you pound on the window like that, Aunt Kate, it always makes me think something has happened."

"Well, I dont know but something has happened. What have you got in that pail?".

"Oh, nothing much—just something I put in there from my pockets."

"What did you put in there? Can't you answer me without going all round Robin Hood's barn?"

"Ouch!" Melley cried, leaping into the air and clutching at one side of his coat. "Now, you've gone and stopped me, and the've got turned round so I can't get hold of their tails!"

"What have you got in your pocketts? I want you to answer me right off!"

Miss Kate came out upon the back porch and started down the steps. Holding his coat away from his body and watching the side pocket with one eye, Melly advanced to meet her.

"Why, it aint anything," he declared, "only some little things that Marty Blaisdell found and turned over to me! Can't you see the head of that one sticking out?"

A black pointed nose was thrust from the pocket and was weaving about in a snake-like mmanner.

"What is that—a snake?" Miss Kate cried.

"No, it ain't a snake! Don't you know a little snapping turtle when you see one?"

"My goodness! A boy of your age collecting mossback turtles! I thought you gave up that sort of thing three or four yeears ago."

"Well, this is different—this ain't play, this is business."

"Humph! Business! How many of those miserable things have you got?"

"Seventeen—unless one of 'em got away, I ain't sure yet, because you interrupted me. Marty Blaisdale found the eggs and raised 'em. He turned them over to me."

"Well, you didn't have to take them, did you?"

"Of course! I'm president, he's only secretary."

"President! President of what?"

"President if the Snapping Turtle Soup Company. We've organized it, and we've got to lay in a stock before we can have anything to sell."

"I declare Melancthon Derby, you've outdone yourself this time! This is the most foolish thing I ever knew even you to think of! Who on earth wants any snapping-turtle soup, I'd like to know."

"Why, everyone would," Melly declared with some heat, "if they only knew how good it is, and we've got out literature and tell 'em Haven't you read how rich people always have Other folks would like it if it only were within their means, and we intend to put it there."

"But that's sea turtle, it isn't these wretched mossbacks!"

"Well, what's the difference? Do you know, Aunt Kate, that there's seven different kinds of meat in a snapping turtle, most of it like veal? Why, it's a great deal better than any sea turtle, and we're going to prove in our circulars that its even better than diamond-back terrapin! Did you ever eat a turtle?"

"No, I never did, and I don't inteud to , either! What are youu going to do with those nasty things?"

"As soon as we can get the creek fenced in, we're going to put 'em there to grow."

"Fence in the creek! With what?"

"Why, we've got some old chicken fence, and so's Billy Jenkins! He's treasurer. We ain't going to fence it all in, we ain't got woven wire enough. After the company gets well established, though, I presume we,ll need a lot of creeks. You haven't any idea, Aunt Kate, how many snapping turtles there are in the country, all going to waste now. I wish you could see the folder Tim Mosher is getting up. He's our advertising manager. He's finding all about turtle soup, and has got a dozen receipts for making it, and he's going to write up the life history of the snapping turtle, too, so's to have a page or two of interesting reading."

Miss Kate gazed at Melly with a curious expression, in which strong disapproval of the boy's wild schemes mingled with a sort of dumb wonder at the fertility of his imagination.

"Where is the money coming from for these folders and other expenses?" she asked dryly.

Melly wriggled under her fixed gaze, "Billy could explain that better than I can. After we get stock of turtles, so's to have something to stand on, we're going to hold a directors' meeting and decide. Maybe we'll issue stock, or maybee we'll issue bonds. It dont make much differencee which, so long as we get money for working capital."

"No," his aunt agreed, "I don't think it'll make a whole lot of difference. How much do you reckon that these turtles you're going to stand on are worth."

Melly glanced sidewise at her, for her tone, to say the least, had been sarcastic. "That depends upon how many we get, of course," he said, "but let's take just these seventeen we've got now. By the time they're grown next summer they'll weigh twelve or fourteen pounds apiece. Allowing half of that for waste, we'll say they average six and a half pounds of dresed meat. Now at ten cents a pound, that comes to sixty five cents, and seventeen of 'em would be worth —let's see—"

Melly stoped to do a little mental figuring. "Well, say about eleven dollars for only seventeen," he went on. "The sand banks along the creeks are just full of eggs, and we're going to get all we can find. There are thousands of them, and besides, when you make the meat up into soup it foots up a whole lot faster than I've figured. When we get our turtles together, we can show people all kinds of value. Aren't they selling stock in fox farms and such things? Foxes ain't half as practical or a millionth part as plentiful as snapping turtles, Aunt Kate!"

"Then you're not going to sell any stock till you get your turtles together?"

"Why, no—not unless somebody comes and asks for it."

"Well, I guess nobody will. But what are you going to feed them?"

The boy scratched his head thoughtfully. "Mostly they feed themselves," he explained, "but of course, if we shut them up and they ge pretty thick, we'll have o feed them. Every time we catch turtles we're going to cach frogs, and every time we get turtles' eggs we're going to get tadpoles. The turtles will eat the frogs, and the tadpoles will grow up just in time for the turtles that hatch out to eat them. You see, in hat way, feeding them won't cost anything except a little time and trouble."

Miss Kate shook her head sadly "You go and put the rest of them in the pail," she said, "and get them down to the creek just as quick as you can, for I don't want them crawling round here."

Melly returned to the barn, and for a time his aunt stood watching him wondering wether or not to put an immediate stop to the preposterous scheme. At last she decided that in a short time it would fall of its own weight.

On the following Saturday four or five boys inclosed part of the creek with woven-wire fence. The part thus impounded was not very large, but evidently they judged that it would do for a beginning, for they dumped the bucketful of young tortoises inside the inclosure, and with admiring eyes watched the little reptiles scuttlee to cover. Then the boys joined in a hunt for turtle eggs.

As Melly was rather close-mouthed on his return, Miss Kate did not know how the hunt had succeeded until two or three days later, when she discovered a bed of freshly spaded earth on the southern slope at the foot of the garden.

"What have you planted there?" she inquired.

"I haven't planted anything there," said Melly. "That's our turtles'-egg incubator."

"Have you got a lot of the eggs of those nasty things in there?"

"Yes, most two hundred."

"Then they will be crawling all over in no time!" cried Miss Kate. "Didn't I tell you to keep them down by the creek and away from tthe house?"

"Well, we'll look after 'em. Its more to our interest to put 'em on the creek than to yours,we don't want to loose any of 'em."

"I don't think you're watching very carefully, theres one scrambling round under those pieplants leaves now."

Melly ran to investigate, extended his hand, and drew it quickly back.

"My goodness!" Miss Kate cried, pulling her skirts tightly about her ankles. "It's a snake, a little water snake! You've put snakes eggs here instead of turtles eggs!"

Melly looked extremely crestfallen. "Maybe it just came up from the creek,"he suggested. But that theory seemed hardly tenable, especially as at that moment two more snakes wriggled from under the sheltering rhubarb leaves.

"You get every one of them out of there this minute!" Miss Kate commanded, fleeing with a succession of short leaps toward the house. "Get a shovel and dig out every last egg before you do another thing! If you don't, I'll hire a man and have him do it, and have him tear up your fence, too! The idea of your not knowing snakes' eggs from turtles' eggs!"

"Well, could you tell 'em apart? They look a lot alike."

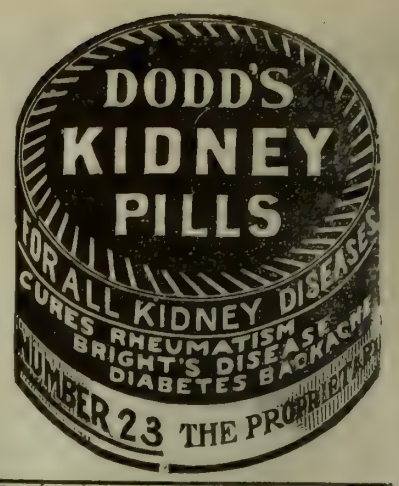
"I could if I were a turtle farmer, or I wouldnt go into the business. Now, you do as I tell you."

Melly got a spade and went over the ground inside the "incubator" limits with considerable thoroughness for he judged that the futuree of the company depended upon his obeying promptly.

All things considered, the Snapping-Turtle Soup Company had not made a very promising beginning. And when in the course of the summer, several of the original seventeen tortoises escaped from the inclosure through a muskrat's hole, the boys' interest in the enterprise began to wane. Toward fall,however, Billy Jenkins, while fishing, hooked a hugh mossback that

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.



WIFE TOO ILL TO WORK

IN BED MOST OF TIME

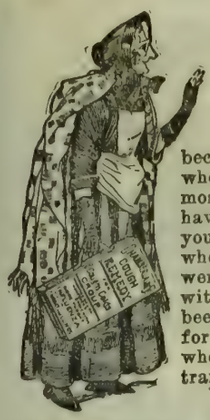
Her Health Restored by Lydia E. Pinkham's Vegetable Compound.

Indianapolis, Indiana. — "My health was so poor and my constitution so run down that I could not work. I was thin, pale and weak, weighed but 109 pounds and was in bed most of the time. I began taking Lydia E. Pinkham's Vegetable Compound and five months later I weighed 133 pounds. I do all the housework and washing for eleven and I can truthfully say Lydia E. Pinkham's Vegetable Compound has been a godsend to me for I would have been in my grave today but for it. I would tell all women suffering as I was to try your valuable remedy."— Mrs. WM. GREEN, 332 S. Addison Street, Indianapolis, Indiana.

There is hardly a neighborhood in this country, wherein some woman has not found health by using this good old-fashioned root and herb remedy.

If there is anything about which you would like special advice, write to the Lydia E. Pinkham Medicine Co., Lynn, Mass.

Here Again



"Granny" Chamberlain

I have come back to stay in Canada as long as cold weather lasts, because that is when I can be most useful. I have helped young mothers whose children were choking with croup, and been the comfort of parents whose children tramp to school in the wet wintry weather.

Many a cold and attack of bronchitis I have warded off, and thousands I have helped in the anxious time of whooping cough.

You will see me often, for I have much to tell you of what can be done in the home with.

Chamberlain's Cough Remedy

Yours for Health
—Granny Chamberlain

26

weighed nearly twenty pounds, and turned it over to President Derby.

"What shall I do witth him?" Melly inquired doubtfully.

"Why, put him in the creek, of course!" said Belly. "Ain't he a wopper?"

"Thats just the trouble. How am I going to get him there? See him reaching for my leg! If he got hold once he'd take a chunk right out!"

"Have him bite the end of a stick and then drag him along on his back," said the resourceful Billy.

Melly tried that plan and found that it worked, the "snapper" held on to the stick like grim death. But the boy made such slow progress that darkness had fallen beffore he reached home. The creek seemed so far away that he decided to defer until the next morning the task of putting the tortois into the watery compound.

A glimmer of ligh from the hall window told him that Miss Kate was somewhere upstairs. The coal closet, just off the kitchen, was empty except for a little "tucket" corn that had been put there temporarily, so, swinging the snapping turtle off the ground Melly carried it inside at arms length and shut it in the closet. Of course, Aunt Kate would be mad if she knew, but there was no kneed of her knowing.

After supper Melly went to bed rather early, and some timee elapsed before he heard his Aunt come upstairs. Then, almost at once, she repassed his door, downward bound, and certain sounds tthat he heard roused his suspicion. Was she going to that coal closet for something?.

Melly slipped from his bed and tiptoed down the stairs. Yes, she was in the closet, and he expected to hear a shriek at any moment. But all was silent. Presently she came out, leaving the dor ajar, and started for the stairway. Melly stole into the dining room, and she passed him without detecting his presence.

He must close the door before the tortois escaped. In the match box on the kitchen wall he found a single match, and struck it on the doorframe of the closet. As the blaze leaped up, he peered into the corners of the little room, but could see nothing of the turtle, which he suspected must be hiding behind the door.

The short lived flame was dying rapidly. Craning his neck to see behind the dor, he tok a quick step foward, when — click! — something closed on his bare foot with a vise-like grip, and as he tumbled backward, the match went out.

"Oh, oh, oh! He's got me, he's got me! Oh-h-h-ee!" Melly shricked rolling out into the kitchen, where he upset a chair to add to the racket. Aunt Kate came down the stairs in a hurry, and as the lamplight flooded the room, Melly found that his foot had been gripped, not by the tortise, as he had feared, but by a "kill-'em-quick" rat trap.

He was barely a second in freeing his foot, after which he looked ruefully at the red marks on the skin. "Why didnt you tell me that you were going to set a trap to-night?" he asked reproachfully.

"Why should I? What were you doing down here, snapping round?"

"Why," Melly began, "I—I—"

His voice trailed off, and in spite of himself his eyes remained fixed on the claset doorway, from which came a rasping, scraping sound. Miss Kate's glance shifted to the same quarter, where she saw a black head, followed by a round, brownish-green shell, slowely emerging into the lamplight.

"Oh," she cried, "I understand! How many times have I told you—"

Leaving the sentence unfinished, she opened the rear door and seized a broom. In another moment she had hurried the mossback out upon the back porch, and there left it to its own devices.

"Now," said the irate lady, "I'm done with this foolishness, and so are you! To-morrow you ttake that fence out of the creek! Do you understand me?'

"Yes, I do?" Melly replied plaintively. "I should think you could bring me some arnica or camphor or something, after leaving traps round to take the skin all of a fellow's feet!"

After Miss Kate had bathed and bandaged his foot, Melly felt better.

"I don't much care about the company, anyway," he confided to his aunt, "for I made up my mind some time ago that there wasn't enough capital or enterprise round here to float it. Put you mark me, Aunt Kate, somebody'll serely take hold of snapping turtles some day and get rich out of 'em."

COUGHS, COLDS,
and LA GRIPPE
Cured by
VENO'S LIGHTNING COUGH CURE.

It is the power of Veno's Lightning Cough Cure to strengthen all the organs of breathing that enables this wonderful medicine to cure Coughs, Colds, La Grippe, and Bronchial affections so quickly and so thoroughly. Veno's Lightning Cough Cure contains rare curative principles (not found in ordinary preparations) which help the system to throw off respiratory troubles, and so Veno's cures where other means fail utterly. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

"CANADIANS AT YPRES."
(See Store Windows.)

12 Outer Covers from the 60 cent size of Veno's Lightning Cough Cure, or 24 from the 30 cent size, mailed to Harold F. Ritchie & Co., Ltd., 10, McCaul-street, Toronto, entitle you to a beautiful coloured reproduction of this famous Royal Academy painting. The reproduction is on view in most druggists' windows.

DANGEROUS HEALTH IDEAS

The opening of school marks the beginning of the health problem in the family of one or more children. Every school year there are epidemics of scarlet fever, measles, mumps, grippe, whooping cough, and chicken-pox, with once in a while an outbreak of diphtheria or smallpox to lend variety.

"Smallpox," someone exclaims indignantly,"why there is no comparison between that and whooping cough. Why of course I wouldnt think of exposing my child to smallpox!" One cannot but be sorry for the misguided individual. The average child might better have the average case of smallpox than a case of measles, scarlet fever, or whooping cough.

Almost all of the children's diseases are only too apt to leave a trail of evils from which the child recovers slowely if ever. "Running ear," so-called weak heart, which usually means some organic trouble, kidney disease, and deafness are the by-products of many cases of scarlet fever. Whooping cough has resulted in bad cases of convulsions, hemorrhages, broncho-pneumonia and too frequently in tuberculosis. The idea of exposing children to infectious diseases during early childhood is so exceptionally short sighted for it has been proved by bitter experience that it is the young child who most frequently gets the infection and dies from it. As the child grows older he seems to acquire a certain protection from the germs of these diseases. If we can keep him free from them until he is ten or twelve years old, he may never contract the disease or if he does he has it in a milder form.

Measles is frequently looked upon as a sickness of minor importance and that in the face of records which show that in the case of the child under five years of age, the death toll is usually heavy. Further than that, no disease except whooping cough seems to be such a sure forerunner of tuberculosis.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.
If you my sister, are [illegible] of ill-health, and feel [illegible] pleasures, or daily [illegible], write and tell me just how you suffer, and let me my **free** ten days' trial of a home tr[illegible] with references to C[illegible] how they have [illegible] happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without any [illegible]. You **cannot** [illegible] sufferings; what we women know **from experience**, we know better than any doctor; and thousands have passed there is hope **for the hopeless** in my method of home treatment. If you suffer from pain in the head, back, [illegible] bels, feeling of weight and dragging down sensations, falling or displacement of internal organs, ladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly **or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living.** I invite you to send to-day for my complete ten days' treatment entirely free and **postpaid**, to prove to yourself that these ailments [illegible] easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when **you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all—young or old. To Mothers of Daughters, **I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health.** Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS, - - - BOX 309 - - - WINDSOR, ONTARIO

That the mother may deal more intelligently with the problem of quarantine in these cases of infectious diseases I will briefly outline the striking characteristics of the most serious of the so-called children's diseases.

Scarlet Fever

Every doctor and nurse dreads an epidemic of scarlet fever. While it is not, possibly, as contagious as measles, yet it is the worst of the children's diseases and requires the longest quarantine. It usually makes its presence known a week after exposure. There is at least one case reported by Dr. Holt, where it was only six hours after exposure to the first symptom.

The first signs of scarlet fever may vary, or it may be so wide of the usual that it will be diflcult to recognize. However, the reasonably well behaved case begins abruptly with a temperature, a sore throat, and frequent vomiting. This combination is enough to awaken suspicion. If there is an epidemic, one may be unhappily sure that when all these signs are present there is little doubt of the diagnosis. In from twelve to thirty-six hours after the first hint of trouble the sickness comes out in its true colors and there is a decided scarlet rash.

The time of greatest contagion is during the height of fever, usually from the third to fifth day, but all danger is not past until the child has finished "peeling" which may take six weeks or longer. In even the mildest cases the child should not be allowed to mingle with other children for at least four weeks and he should not sleep with another child for three months. It is evident to the most careless observer that scarlet fever is a menace to which one ought not expose any child needlessly. During an epidemic it should be the duty of every parent to see that health measures are rigorously enforced in the schools and that the children with the disease are not allowed to attend school until a month after all symptoms have ceased. It is better to inconvenience one than to expose the whole school.

Whooping Cough

The cough once heard, the diagnosis is no longer in doubt but sometimes the whoop does not appear until a week or more after the beginning of the trouble. Any cough that is worse at night and appears during a whooping cough epidemic, and which does not yield easily to remedies, is quite likely to inform you of its true character by a whoop, before it ceases entirely.

Because the disease is so difficult to diagnose and because the whoop does not put in its appearance immediately, it is hard to tell just what the incubation or developing period is, but it is probably about the same as measles, anywhere from seven to fourteen days. Its infectiousness, however, lasts longer. In most cases six weeks is the course of the disease, sometimes it will take weeks longer before all symptoms abate. The child should not be allowed to play with other children until the whooping stage is past, or until all coughing has stopped.

The hemorrhages, convulsions and weakning effect of wooping cough make it a disease to be dreaded. Any one who has ever seen a child racked by the paroxysms of coughing must always feel that needless exposure is unpardonable.

Mumps, while exceedingly painful, are not as a rule anything serious, altho, like the erysipelas that sometimes follow chicken-pox, the complications may become a problem.

Most people are sufficiently fearful of diphtheria that they will take all needed precautions. It will be infinitely better for all concerned when people realize the seriousness of all of these children's diseases. If every family, unlucky enough to become infected, would follow out absolutely the rules of the board of health we could soon stamp out epidemics. If we would but follow the Golden Rule, we could by protecting our nighbor's children protect our own. If your child has some suspicious symptoms that make you think of measles, scarlet fever, or whooping cough, keep him at home. Keep him out of school. If you make a mistake in your diagnosis there will be no harm done. If you are right you have done your duty by your neighbor's child. On the other hand, when a child comes to play with your little ones and he looks ill, send him home. A sensible mother will find no fault with that.

Since spring and fall are quite apt to yield their quota of epidemics, pay especial attention to the children's health at these times. Keep yourself posted on the epidemics in school and warn the children of the folly of using pencils and books belonging to other children. It is a reflection on our intelligence and our community spirit that we tolerate so frequent and constantly recurring epidemics of children's diseases.

Measles

There is only one other child's disease that, in point of infectiousness, stands at the head of the list with measles and that is whooping cough. Both have a tendency to appear one right after the other. A child will recover from whooping cough only to gobblee up a select collection of measle germs.

Measles like scarlet fever is accompanied by a rash but where the fever usually begins abruptly, measles take more time to start the trouble. It usually begins as a cold, with a good deal of discharge from the nose and quite a bit of redness and watering of the eyes. The "spots" or rash usually put in a firstt appearance on the face, or back of the ears at the roots of the hair, from there it spreads gradually until it has covered the body. This usually takes place anywhere from the fourth to the sixth day. During the first days of th rash the child is most uncomfortable. One of the most important trade marks of the disease is the "Koplik's sign" which can in most cases be found on the inside of the cheeks opposite th double or back teeth, where it appears as tiny bluish specks on the reddened background. This is what may be termed a sure sign but unfortunately it is not always easily distinguished, especially by artificial light and it fad s when the measles rash is full grown.

Measles require from eleven to fourteen days to get itself in working order If you have been exposed and have no symptoms inside of fifteen days you are pretty sure to be able to pat yourself on th back and congratulate your system on having no liking for measles. The disease is most easily "taken" during the catarrhal stage and diminishes in contagiousness as the rash disappears. Unlike scarlet fever it is not a menace for such a long time. Usually at the e nd of three weeks the child is no longer a source of danger to other children.

The most to be feared feature of measles is the frequent complication of broncho-pneumonia and the thoroness with which it weakens the system until it falls an easy prey to any infectious disease, tuberculosis especially. Frequently in taking the history of a patient ill with tuberculosis the following facts are found. "I've had a little catarrh and havent feelt quite well since I had the measles." Or the story is varied by this, "After I had the measles my mother said I had bronchitis for a long time." Sometimes they give a history of a swollen gland but always the connection between tuberculosis and measles is markedly suggestive.

If one could be sure of taking German measles the outlook would be nothing to worry about for true German measles is the mildest of the chrildren's diseases. Unfortunately our systems are not always careful buyers and are quite apt to pass by the mild German brand and pick up the real old fashioned kind with its long train of ills.

No Stooping

BENDING over to a low-down oven is needless work.

The Handy-height Oven makes baking a far, far lighter task. You can see things baking through the Clearview door.

The Lighter Day does away with stooping. It makes your days brighter. It lightens your work.

Modern white porcelain enamel and bright nickel finish. Sold in 700 stores. Book of photos on request.

WASHING WOOLLENS WITHOUT SHRINKING

To wash woolen goods successfully the water should be soft and warm, not hot, and of uniform temperature throughout the operation. Only the milder soaps should be used and these not applied directly to the fabric. If much dirt is present, a volatile alkali such as ammonium carbonate may be added to the wash water.

The scrubbing to which fabric is subjected, should be gentle, and the wringing through loosely set wringers.

Once washed, the goods should not be allowed to lie about wet, but should be immediately hung up to dry preferably out of doors if the air is dry and the temperature above freezing.

The reason for this careful treatment is found in the peculiar nature of the wool fabric. Its outer or epidermal layer is made up of minute serrations which are arranged in some such manner as the scales on a fish. Now these scales are softened and opened up by hot water and by such alkalies as are found in the harsher soaps. In this softened condition the pressure due to hard scrubbing is sufficient to cause the serrated edges of the fibres to interlock or felt. Felted fibres are usually hard and brittle. This is because the alkali which has helped in felturing process has removed from the cells certain fatty substances which serve to make the fibre soft and pliable.

Fabrics which have become hard and felted, have not only lost their attractiveness, but also most of their usefulness as a protection from the cold. This latter quality is due to the "air blanket" which forms in the spaces between the fibres, for quiet air is, as we know, a very poor conductor of heat and cold. When the fibres have become felted, these air spaces are lost and consequently the fabric is no longer able to materially aid the body to retain its heat.

CLEAN YOUR DRESSES WITH CARBON TETRACHLORIDE

While gasoline is, as most of us know, a cheap and effective cleaning agent, it has one great disadvantge. It is extremely volatile, and its vapors form, with air, an explosive mixture. On no account then, must it be used in a room containing a flame of any kind. There is, however, another cleaning agent, more expensive than gasoline, it is true, which is absolutely non-inflammable. This is carbon tetrachloride, a substance but little known as such, but often sold under such trade names as Aolval, Eradeline, Antiflammen, etc. This substance is, like gasoline, a fat solvent, and cleans by dissolving out the grease which mechanically holds dirt in the fabric. Carbon tetrachloride has another advantage over gasoline, it spreads less readily and for that reason is less liable to form a ring when grease spots are removed by sponging.

KEEPING VEGETABLES HOT

When mashed potatoes, baked beans or any of the various creamed or escalloped dishes must be kept hot for any length of time, try placing the vessel containing the food in a larger one containing hot water. Place a cover over the larger vessel and you will find that the steam will keep the food hot and moist with no suggestion of aver-cooking. This fact is especially noticeable with escalloped dishes. During threshing or corn shelling time, when considerable time elapses in serving all the men, this will help to make the meal of the last man to be served as palatable as that of the first one to sit down.

If the cover is replaced each time after the food is removed, the dishes will be much more easily washed as the steam will keep the food loose from sides as well as bottom of the kettle.

OLD TIME APPLE PIE

Now some one is longing for the real old time apple pie and here it is, and believe me, it is good. Make a good, rich crust, as a rich, flaky crust is essential to any good pie. Line the pie tin with the bottom crust rolled thin. Pare and slice thin enough tart apples to fill the tin, heaping up a little in the centre. Mix one half teaspoonful of cinnamon, and level dessert spoonful of flour and three-fourths cupfuls of sugar together and stir in among the apples. Add one tablespoonful of water and one tablespoonful of butter put on in dabs, and bake with top crust. Bake until a light brown.

WHEN MAKING COMFORTERS

When time for washing comforters comes each year the woman who has had the laundering of them in mind when they were made has an advantage over her sister housekeeper. Removable covers are real comforts when they have to be cleaned. In making cotton comforters it is a very good plan first to tack the cotten in a thin cheesecloth cover, the tacking is quickly done if a long back stitch is used. There is no need of tying the heavy thread used on the inner cover. After the cheesecloth comforter is finished place it in the silkaleen cover and then tack through the silkaleen in a few places with pretty yarn knots. The silkaline cover is easily removed when it needs to be laundered. The cotten in its cheese-cloth cover should be well sunned before it is put back into its nice clean dress.

CEMENT FOR CHINA

One ounce of shellac dissolved in one-half ounce of oil of turpentine. Work into this two and one half ounces of fine powdered pumice stone. Or a paste may be made of white lead mixed with half the quantity of pipe clay and moistened with boiled linseed oil.

To Investors

THOSE WHO, FROM TIME TO TIME, HAVE FUNDS REQUIRING INVESTMENT, MAY PURCHASE AT PAR

DOMINION OF CANADA DEBENTURE STOCK

IN SUMS OF $500 OR ANY MULTIPLE THEREOF.

Principal repayable 1st October, 1919.

Interest payable half-yearly, 1st April and 1st October by cheque (free of exchange at any chartered Bank in Canada) at the rate of five per cent per annum from the date of purchase.

Holders of this stock will have the privilege of surrendering at par and accrued interest, as the equivalent of cash, in payment of any allotment made under any future war loan issue in Canada other than an issue of Treasury Bills or other like short date security.

Proceeds of this stock are for war purposes only.

A commission of one-quarter of one per cent will be allowed to recognized bond and stock brokers on allotments made in respect of applications for this stock which bear their stamp.

For application forms apply to the Deputy Minister of Finance, Ottawa.

DEPARTMENT OF FINANCE, OTTAWA,
OCTOBER 7th, 1916.

HOW TO MANAGE A RESTLESS HORSE

(Continued from page 66)

It may be necessary to give him a lesson first with a foot lift rope. This is a strap with a ring on it buckled below the ankle of the horses front right leg. Secure a rope, preferably a half-inch cotton one, about 12 feet in length. Pass one end through a ring fastened to the surcingle or belly-band of the harness, down through the ring on the foot, then up and tied to the curcingle. Take hold at the other end of the rope with the right hand.

Put on lines and drive him without first hitching to a rig. Give command to stop, pull the lines, and pull up on the rope all at the same time. Repeat this until the horse knows what it means, and obeys. Then hitch to the rig and repeat. By patience and kindness and rewards of kind words, a little "something" that he likes to eat, given when he does as he should, goes a long way in making the horse stand when wanting him to. Never should the horse be induced to start in a hurry.

Put blinders on the horse, and hitch him from either side to prevent him from turning around. Get located where the horse can' see you, and when he paws strike him on the fore legs with a good keen whip and he will soon think that the pawing is producing the cuts and get disgusted with the habit.

To prevent forging, shoe light behind good weight roller motion in front, frnt shoes very short not to extend past the hoof.

To get a horse to stand while getting in the rig, put him to a breaking cart and simply hold him if he rears and falls. When he gets up continue to hold him as if nothing had occurred. Plenty of use is helpful as it takes up the excess energy until habit is overcome.

PREPARING FOR WINTER EGGS.

(Continued from page 67)

for the meat part of their ration. If the hoppers are kept full the hens will begin to lay as soon as the molt is finished and the pullets will lay steadily after they have once started.

The usual farm diet for poultry has too much of a sameness. Corn or wheat, whichever is the more plentiful is the grain usually given them, though if wheat prices keep on soaring it is not likely they will get over much of that. In feeding the chickens it must not be forgotten that he price of eggs is keeping even step with those of corn oats, wheat and other grains, and that real economy lies in feeding for egg production.

Considering the food value the price asked for wheat screenings is little if any less than what good wheat sells for, and moldy or smutty wheat is dear at any price, as either of these are injurious to the digestive organs. Smutty wheat can be washed without a great deal of trouble, but unless one is provided with good facilities for drying it again the operation must be performed every day or two.

The simplest method of washing is to fill a pail or tub with water and pour the wheat slowly into it. The smut kernels, being lighter than the other, will rise to the top and flow ove. the edge of the tub. Stir with the hands or a padle, drain off the water and repeat the operation until water is clear.

Wheat that has been wet and kilndried should not be depended upon as a regular ration as the hens are not fond of it and will not eat enough to keep up egg production.

A good grain ration is all the corn they will eat at night and about half that amount of wheat and oats for the morning feed, or the corn, wheat and oats may be kept before them in self-feeders providing the operation of the feeders gives them sufficient exercise.

The purpose of the grain is mainly to sustain life. For egg production they require in addition some food rich in protein, such as meat scraps or dry meat mash, preferably both of these.

A hen can be kept for 75 cents to $1 a year and lay a few dozen eggs when prices are low, or the addition of another 50 or 75 cents in egg-making foods will enable her to produce double the quantity with double the price for the surplus. This is the place to look for the money in poultry raising.

The natural time for a hen to lay is when she can gather insects and green grass. Give her the equivalent of these and she will lay during the winter. Meat scraps is the cheapest form in which to buy egg-making food. It is the only poultry food that has not advanced in price during the last few months.

Our miller nailed the following formula to a post in the mill and mixes the feed to our order at an average cost of about two cents per pound. Double the amount of alfalfa is used during the winter to add greater bulk:

Bran	200 lbs.
Ground corn and oats	200 lbs.
Middlings	100 lbs.
Alafafa meal	50 lbs.
Meat scraps	100 lbs.
Salt	5 lbs.

C. N. Whittaker.

WHEAT SMUT CONTROL.

(Continued from page 57)

the soil of a field producing a crop of smutted wheat this year may harbour enough smut spores to cause the appearance of smut in next year's crop if the field be re-seeded to wheat. This sometimes occurs where smut is very bad, in spite of the planting of treated seed, and shows that in such localities crop rotation should be practised in addition to seed treatment. Bunt or covered smut of wheat attacks no other cereal crop, but other cereals have their own smut diseases.

Loose Smut.

The other wheat smut occurring in this country, known commonly as loose smut, is not so serious as bunt, though it probably produces an average loss of three-fourths of one per cent of the total wheat crop of the country. Loose smut may be prevented by treating the seed by the Jensen hot-water method or some modification of it.

The Jensen method consists in soakin hot water at a temperature of 132 to 133 degrees F. It is highly important that the water shall not rise over 135 or fall below 130 degrees F. A temperature below this will not kill the smut, while a temperature too high may affect the germination of the seed. The grain, after treatment, should be immediately spread out to dry. If it can not be spread out at once, it should be dipped into cold water to cool and spread as soon as possible.

YOU can save Belgian lives!

Though you cannot fight and kill Germans, you can give and save some of their helpless Belgian victims, three million of whom must be fed or starve.

So little is needed to feed a Belgian family, and so economically are contributions handled by the Belgian Relief Commission, that there are very few of us who could not provide for at least one family through this winter, or till the end of the war.

$2.50 a month—less than 10c. a day—will do it! How easily you could save that much from your little indulgences—and how much it would mean to some Belgian mother and her hungry little ones!

Wouldn't a little self-denial now be richly repaid by knowing, when the war is over, that you had done your part, and had saved precious lives for our unfortunate Allies?

Enroll your name to-day among those who are doing their bit in this way! Send your subscription weekly, monthly or in one lump sum to Local or Provincial Committees, or

TREATING TREES FOR SCALES

I observe that Charles M. Patterson in discussing a cure for SanJose scales advises complete destruction of the trees and then replacing with other trees not affected with scales. But what then if the scale is in the neighborhood? What good does it do to destroy infected trees, replacing such trees with healthy trees nly to have the dealthy trees in a short time becomejust as badly affected as the trees previously destroyed? Such a doctrine is not so up to date. We nave methods for treating scale which are just as effective for ridding fruit trees of scale affliction as for colts of lice, sheep of ticks, range steers of mange, or southern cattle of cattle ticks.

You might say with equal honesty that when colts are covered with lice or steers with mange, or sheep with scab that the thing to do is to slaughter or market at once. The average live stock man would laugh at such a doctrine. He would say spray or dip and thus get rid of the pests. Not only do this once, but ffrequently, and at the samee time clean up the infected quarters, otherwise live stock put in the same quarters would soon be as badly affected as the infected individuals. That is the way it was with San Jose scls. Destruction of trees in this day and age is a foolish practice. It means loss of years in growth nd then when healthy trees are planted you are right back where you were before, unless you spray.

The practical, common sence, right treatment is to spray. When effective sprays, such as are now available, as for instance scaleside, it is absured to talk about destroying trees. Spraying from time to time with scalecide will not only clean up an infected orchard, but soon will have every tree free of these pests and growing vigorously. John M. Weiss of Michigan in discussing his experiences with San Jose scale stated that after many years of hard work he had succeeded in getting several thousand trees up in good bearing, then suddenly he found that they were infected with several pests, including San Jose scale. Now, what did he do? This is what he says: "After trying several spray mixtures I purchased a barrel of scalecide and was so encouraged with results tht I went on and sprayed all of my trees, doing a thorough job, spraying from all sides and spraying no material." He cleaned up his orchard and got fine colored fruit of the best quality.

Mr. Weiss's experience is duplicated in all parts of the country. Take the Tyson Brothers. of Pennsylvania Twelve or thirteen years ago they had 200 old apple trees in which they had failed to control the scale and they had actually cut out 144 trees when having heard of scalecide, they sprayed the remaining 56 trees that were left with this material. Just a few years later they sold one year's crop for $960. These trees remain to-day healthy and productive. One does not need to destroy scale infected trees, but you wannt to get a spraying outfit and go to work and horoughly spray and keep at it, and by so doing clean up the orchard, and then by continuous sprying thereafter there shoul" be little difficulty witth orchard pests or in producing good fruit of good color, fine skin and right quality.

Take the fruit section in any part of the country and for any kind of fruit and you will find the successful fruit growers are the men who depend on spraying, and who spray thoroughly. Spraying is just as important a part of every orchard work as pruning the trees or keeping the soil in proper condition or picking the fruit and of properly packing it for market. No the way to treat San Jose scale is not to destroy trees,but to spray and spray thoroughly.

C. W. Burkett in N. E. Homestead

WHITE PIGS ON PASTURE

M. G. Connolly, writes: "In your issue of July 5 I notice a query re white hogs becoming scabby on rape or other wet pastures, the reason for which you are unable to give. Perhaps you will pardon me for presuming to give some information on this subject. White skin, whether on pigs, horses or other animals lacks 'pigment' or coloring matter, which protects the skin. This dark-colored substance is in the blood, and serves as a protection to the skin. It may often be found in little hard lumps in the skin of an old grey horse. Dark skin protected by this pigment is much more resistant to the effects of the sun, wet, etc., than is white skin, at least that has been my experience. I find that horses with white legs are much more prone to have scratches, grease, etc.,than horses with legs of another color. The pigment protects the skin."

MAKE A HANDY CHURN

When we made a change from butter making tto cream selling and churned only occasionally to supply our household needs we found butter became stale quickly, especially in summer. We got busy with our tools and genius and made a little family churn that furnishes us fresh butter any day in the week at small cost and little work.

We used a glass gallon jar with a screw cap top. Nearly every household possesses similar jars. On this cap top we mountted a 15 cent egg beater gearing, removing the beater portion and substituting a small wooden dasher made from maple. This little churn is easily operated and quickly brings us a pound roll of butter that we know is sweet, clean and sanitary.—Geo. W. Brown, Hancock Co. O.

We hear so much nowadays of the advantages to be derived from the proper use of commercial fertilisers that some of us are almost inclined to look upon farm yard manure and composts as getting old fashioned and out of date. There could not, however, be a greater mistake, and if we neglected the application of natural manure or other form of organic matter for any length of time the diminished crops would soon bring home to us that we were trying to grow plants on an artificial means which Nature revolted against.

SANDWICH

One of the most common questions asked by the housewife is, "Can you tell me a good sandwich filler?" Here are a few that have proved to be very satisfactory.

Meat thinly sliced or finely chopped and seasoned, or mixed with salad dressing.

Celery chopped fine and mixed with salad dressing.

Olives chopped fine and mixed with salad dressing, one-half cup to one-quarter cup olives.

Celery, pimentoes and nuts, chopped fine and mixed with salad dressing.

Cream cheese and nuts, or olives, or pimentoes and cream.

American cheese grated, seasoned with tomato.

Lettuce with mayonnaise.

Peanuts, pounded smooth, seasoned and moistened with cream.

Figs cooked to smooth paste, sugar, lemon juice and nuts added.

Dates and preserved ginger.

Dates and peanuts chopped fine, moistened with cream.

Raisonc cooked to smooth paste, lemon juice and nuts added.

The bread should be 24 hours old and cut in thin, evenslices. If fancy forms are desired, shape before spreading with butter. Cream the butter and spread evenly.

Every Dollar You Invest In Feed for the Cows, ought to bring you two dollars' worth of milk and butter fat. If the feed does not increase the milk yield this much, you are paying too much for it.

EDWARDSBURG GLUTEN FEED

THE TWELFTH NEW BRUNSWICK FRUIT GROWERS' CONVENTION

Knowing that the most progressive fruit growers of the province would be exhibiting their fruit at St. John and that many of the members of the Fruit Growers' Association, other than exhibitors, would pay the apple show a visit, the executive of the New Brunswick Fruit Growers' Association planned to hold their twelfth annual meeting during the show week in St. Andrew's Rink.

The executive members were so busily engaged in getting the big show complete in every detail that the formal meeting was not held until the morning of November 3rd, but in the meantime and after interested fruit growers had ample time, and they took opportunity of the same, to congregate in small groups and move around from exhibit to exhibit, discussing the same and exchanging ideas re orchard care and management and the proper picking, packing and marketing of apples. Whenever opportunity offered, the judges joined in the discussions and helped to shed some rays of light on the most perplexing questions.

On Thursday morning the men got together for their business meeting.

THE PRESIDENT'S ADDRESS

The President, H. H. Smith, Hoyt Station, was in the chair and delivered the following address:—

Officers and members of the New Brunswick Fruit Growers' Association

It is my pleasant duty to welcome you to this, our twelfth annual meeting of the New Brunswick Fruit Growers' Association.

It is with a feeling of pride that I refer to our third apple exhibition, with its magnificent display of fruit. Such exhibitions bring the fruit growing industry into greater prominence, advertise the general agricultural possibilities of our province and bring the fruit growers together in a way that stimulates them to greater exertions and to the adoption of better methods.

It is gratifying for me to be able to state that this has been a good year for the fruit growers of New Brunswick. Apples have been a medium crop and prices fairly good. Strawberries were an abundant crop. Prices ranged high at the first of the season but dropped later on account of the berry season in Ontario and Quebec being late so that we were not able to ship our berries west at paying prices until after our local market had been overstocked. Other small fruits were a good crop and sold at remunerative prices.

The prospects for commercial fruit growers for the near future in our province should be very bright. It is a well established fact that no finer apples and small fruit can be grown anywhere in the dominion than in our province by the sea. One of the greatest advantages that New Brunswick apples possess lie in their wonderfully high color and singular beauty of appearance, as can be readily seen in our fruit exhibitions. Regarding the flavor and quality of our apples it is well recognized not only by all the leading authorities but by the most critical of all critics, namely the great consuming public, that apples grown on the Atlantic coast regions are far superior in flavor to those grown in the west. With the start that has already been made in commercial fruit growing, with plenty of suitable land at very moderate cost, with cheap and rapid transportation, with an overseas market close at hand, with the knowledge that has been acquired as to proper varieties to plant, with the active co-operation of the government, the success of New Brunswick as a fruit producing province seems assured.

We regret that at the present time our fruit growers are handicapped by the absence of cheap and rapid transportation to the European markets in October and November when the fall varieties should be marketed.

It is a well known fact that there are many early and late fall varieties grown in this province which cannot be surpassed in any other part of the dominion. When the crop is light we have no difficulty in finding a market at home at remunerative prices, but in years when the crop in the east is heavy it is impossible to realize satisfactory prices on account of the great quantities of inferior fruit which is shipped into the province.

It is therefore quite obvious that we should reach out and establish trade connections with other markets. The prairie markets are very desirable in deed. The people of the prairies are large consumers of apples and great quantities are imported annually from the early apple growing states to the south of them.

I have no doubt whatever that because of the excellent quality of our fruit, if we grade and pack it properly, we will have no difficulty in obtaining and holding a first place in the markets of the prairie provinces.

For the individual fruit grower to accomplish this is a commercial impossibility; the cost would be out of all proportion to the value of his crop. Co-operatively this is possible and the individual cost would not be great, in fact it should prove an excellent investment.

Organization will not solve all the difficulties with which the fruit grower has to contend, but it will go a long way towards putting the fruit industry of this province on a sound business basis and elevate it to the high position which it justly deserves.

In conclusion I will say that I trust our meeting will be both pleasant and profitable and that we will return to our homes realizing that New Brunswick is the land of the "Big Red Apple" and that money can be made in the fruit raising industry.

Owing to the rush of work connected with the Apple show, Mr. Turney, the Secretary-Treasurer was unable to have his report completed and he asked that the Association appoint a committee of two to audit his accounts as soon as he has them ready. His bank balance at the time of meeting was $347.00 and there were still a few outstanding accounts to be received from parties who had bought trees and spraying materials through the Association. Messrs. W. B. Gilman and S. B. Hatheway were the Auditors appointed by the Association in compliance with Mr. Turney's request. The membership numbers about one hundred.

The election of officers resulted as follows:—Honorary President—T. H. Estabrooks, St. John; President—Roscoe A. Fillmore, Supt. St. John Valley Nurseries, Burton; Vice-President—W. P. Fox, Lower Gagetown; Sec.-

Money in Richer Milk

Big Ben

A *Westclox* Alarm

The Gift of Time

BIG BEN'S the only time-clock the modern farmer knows—he helps the farmer beat the sun to work.

Four a. m., in growing time, starts the farmer's day—brings a bumper crop of hours, for chores and in the field.

That's why Big Ben goes to the farm, at Christmas every year—to lend a hand in preparing for planting days. Now'days there's businesslike system on the farm. Where Big Ben's wound up every night, the farm cannot run down.

So it's Big Ben for Christmas, wherever you go—the gift of time that means good-will all year.

You'll like Big Ben face to face. He's seven inches tall, spunky, neighborly—downright good all through. He rings two ways—ten half-minute calls or steadily for five minutes.

Big Ben is six times factory tested. At your dealer's, $2.50 in the States, $3.50 in Canada. Sent prepaid on receipt of price if your dealer doesn't stock him.

Westclox folk build more than three million alarms a year—and build them well. All wheels are assembled by a special process—patented, of course. Result—accuracy, less friction, long life.

La Salle, Ill., U. S. A. **Western Clock Co.** Makers of *Westclox*

Other Westclox: Baby Ben, Pocket Ben, America, Bingo, Sleep-Meter, Lookout and Ironclad

Treas.—A. G. Turney, Fredericton; Directors—A. R. Gorham, Gorham's Bluff and W. B. Gilman, Fredericton.

R. A. Fillmore, A. G. Turney and W. P. Fox were appointed a committee to draft a resolution to forward to forward to the Dominion Fruit Commissioner. Following is the resolution drafted and passed.

Resolved, That this Association heartily appreciates the very satisfactory and courteous services at the third New Brunswick Apple Exhibition of the Fruit Commission officers and branch; and

Further resolved, That this Association desires to co-operate with the Dominion Fruit Commission as closely as possible for the immediate improvement in the grading, packing and marketing of the New Brunswick apple crop.

The judges who officiated at the big show were present at the meeting.

Mr. C. W. Baxter, Chief Fruit Inspector for Eastern Ontario and Quebec had come to the show to represent Commissioner Johnson who was indisposed and unable to be present, buch to his disappointment, as he had looked forward to meet and get acquainted with the men who are doing things in fruit growing lines in New Brunswick.

Mr. Baxter conveyed the Commissioner's assurances of help and asked for expressions of ideas from the fruit growers themselves as to how the Commissioner and his officials can best serve the New Brunswick growers.

Practical demonstrations in packing at the winter courses and the planning of arrangements for co-operative marketing were some of the things asked for.

P. G. Carey, Apple Packing Demonstrator for Horticultural Division, Ottawa, said the New Brunswick Fruit Show eclipsed all the fall shows he had ever seen and compared favorably with the big winter fruit shows held in the provinces claiming even greater things from fruit growing than does New Brunswick.

The echoes of one of the crying evils and curses that the fruit growers have had to contend with in the past and to some extent now-a-days, was in evidence at the Apple Show, viz: the selling of trees not true to name by unscrupulous nurserymen. Many years of valuable endeavour have been partially lost on this account, and growers not acquainted with the characteristics of varieties of apples have been grievously led astray to the extent that some growers had actually made entries in some sections at the show, conscientiously thinking they were showing the varieties called for in that section and never receiving the rude awakening that they had been duped by the agents until their attention was called to the fact by the judges at the show.

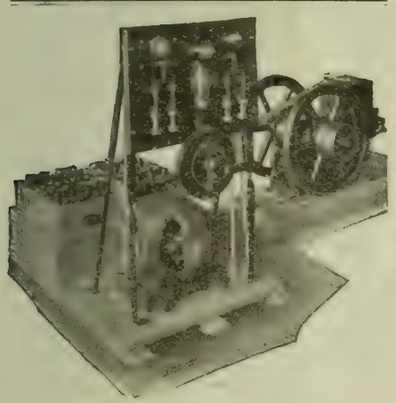
Mr. Carey explained that the promiscuous planting of trees of varieties not suitable to a locality was the worst form of over planting. The planting of proper varieties to suit the respective localities was not over planting. Fameuse and McIntosh varieties as grown in New Brunswick will always be in demand. It is true these varieties are particularly subject to fungus pests, but then spraying for the control of these pests is just a blessing in disguise. He would not advise any grower to plant the Ben Davis and the Stark is not asked for.

Referring to the box pack at the show, Mr. Carey said the work was almost faultlessly done in some cases, while in other cases the apples were literally speaking "thrown in." Education is needed along this line.

As beginners in reaching out for wider markets for their fruit, Mr. Carey strongly emphasized the importance of so grading and packing the apples so that the first shipments would create a favorable impression. This motto if faithfully adhered to, was sure to bring repeat orders. He also expressed his willingness to come to New Brunswick at any time to demonstrate proper packing systems. He had been highly pleased with the seeming readiness to learn of the growers whom he had met at the show, and the good grace in which they received his criticisms of their various packs and packages.

Geo. H. Vroom, Chief Fruit Inspector for Nova Scotia had stopped off in St. John to see the big apple show. He was on his way home from New Hampshire, where he had been judging fruit at the State Fruit Show. The New Brunswick show eclipsed the New Hampshire Show, he said. He had no hesitation in asserting that the present New Brunswick show was the biggest and best ever staged in the Maritime Provinces.

Mr. Vroom strongly urged to discontinue the growing of varieties that do not do well in New Brunswick and devote more attention to the varieties that can be so perfectly grown here.



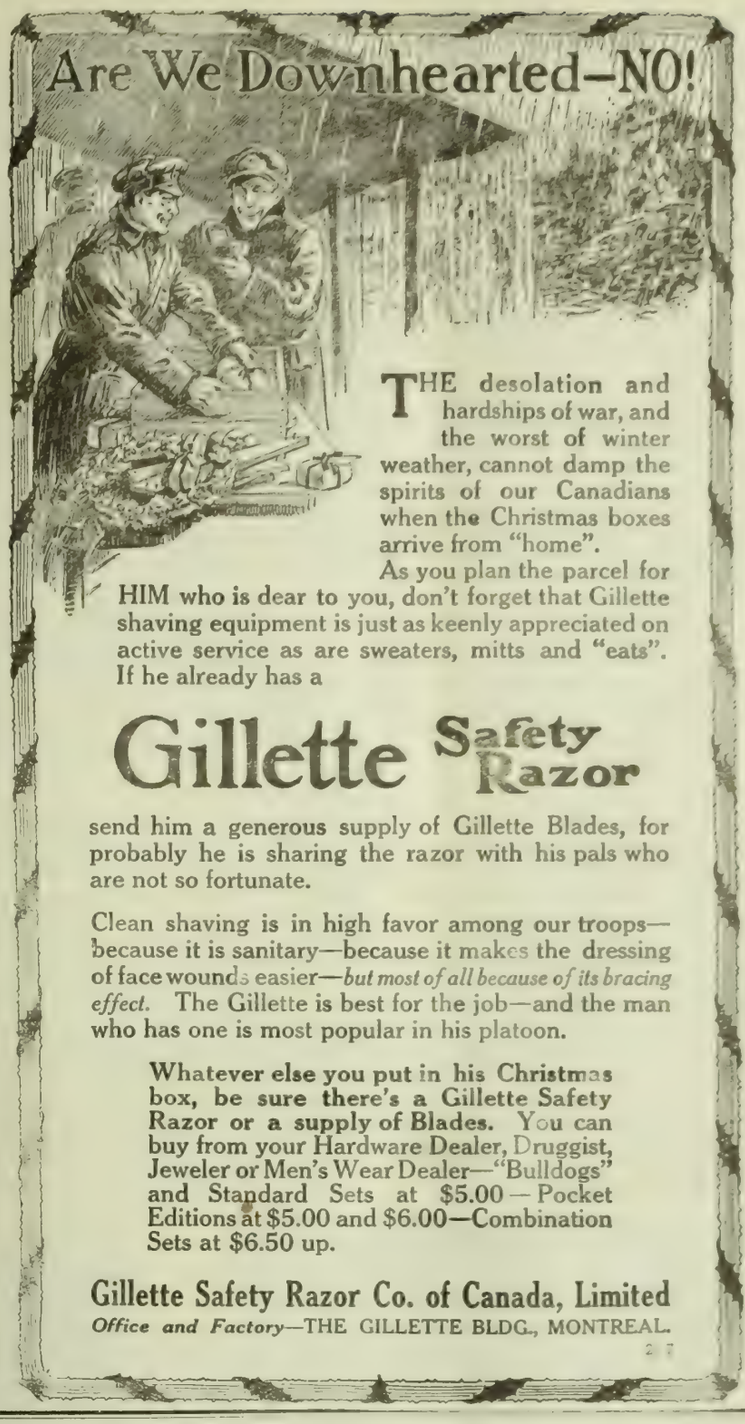
Main Electric Light and Power Plant. To light the farm and country home. Plenty of clean, bright, safe light for house and barn. Runs churn, separator, pump, washing machine and many chores.

T. J. LEWIS, 215 JARVIS ST., TORONTO, ONT.

JERSEY BULLS

Two young Jersey bulls from dams with R. O. P. records. We will sell these bulls at a reasonable price and on condition that the purchaser may return the bull if he is not satisfied with him and we will return the money and pay freight. These bulls are bred right and will get producing stock. Order one you run no risk.

W. C. CLARK & SONS, NORTH WILTSHIRE, P. E. I.



THE desolation and hardships of war, and the worst of winter weather, cannot damp the spirits of our Canadians when the Christmas boxes arrive from "home".

As you plan the parcel for HIM who is dear to you, don't forget that Gillette shaving equipment is just as keenly appreciated on active service as are sweaters, mitts and "eats". If he already has a

Gillette Safety Razor

send him a generous supply of Gillette Blades, for probably he is sharing the razor with his pals who are not so fortunate.

Clean shaving is in high favor among our troops—because it is sanitary—because it makes the dressing of face wounds easier—*but most of all because of its bracing effect.* The Gillette is best for the job—and the man who has one is most popular in his platoon.

Whatever else you put in his Christmas box, be sure there's a Gillette Safety Razor or a supply of Blades. You can buy from your Hardware Dealer, Druggist, Jeweler or Men's Wear Dealer—"Bulldogs" and Standard Sets at $5.00—Pocket Editions at $5.00 and $6.00—Combination Sets at $6.50 up.

Gillette Safety Razor Co. of Canada, Limited

Office and Factory—THE GILLETTE BLDG., MONTREAL.

BELGIUM BEARING HER SHARE IN IT

Governmtnt Is Giving Fifteen Million Dollars Annually to Feed the Hungry People

For the benefit of those who have somehow formed an opinion that those Belgians who are able to help are not helping their destitute fellow countrymen in occupied Belgium it is stated that the Belgian Government, hard put as it is and with its heavy war expenses, is giving $15,000,000 a year to the support of that part of its population which is facing starvation under German rule.

To be sure the British Government is lending a large part of this money but Belgium is assuming the obligation, an obligation which is Britain's as much as Belgium's, for these are the people who fought Britain's battles until Britain was able to account for herself.

It is significant of the unity of these allied countries that they should be working hand in hand thus and it is so that the people of the countries should work. Belgium is a sister nation in distress and Canada, with the others, should help relieve this distress. Seven million of these people are suffering the pangs of hunger—their little ones are dying from starvation—and we must help. The Belgian Relief Committee, with its headquarters at 59 St. Peter Street, Montreal has been organized to assist in this work and to receive your donation. Have you sent it yet? Are you helping Britain and Belgium bear their burden?

Set the separator to take a cream so rich that one gallon will make from three to three and a half pounds of butter.

Fir Shade Farm Dual-Purpose Shorthorns !

Several years ago I imported from Ontario three Dual-Purpose Shorthorn animals, and now have in my stable at Rothesay eight representatives of this breed. Two of the females are entered in the Record of Performance, and so far have done excellent work. If you feel disposed you might drop in and see these the first time you are in the vicinity. Perhaps some time when you are coming to the city you would let me know, when I could arrange to go to Rothesay with you.

P. R. L. FAIRWEATHER. St. John, N. B.

WHEN YOUR TEAM PULLS UNEVENLY

If a team pulls unevenly, does the horse ahead or the horse behind pull the greater amount of the load.

A. L. Ewing, of the Minnesota State College says.

"We demonstrate to our classes in physics that with one type of evener, a type in common use, with clevis pins on a line back of the draft pin, the horse that is ahead has the advantage. We use for this purpose theevener itself or for convenience a pattern made of a one-half inch board of the exact dimensions of an evener.

"The board is suspended from the draft-pin hole where it balances horizontally. Equal weights are now suspended from the clevis-pin holes, when it is found to balance so long as the evener is horizontal, showing that it is an equalizer if the horses are together. It will not, however, balance in an oblique position, but requires a considerable added weight at upper end to hold it in any particular position representing one horse ahead of the other, thus demonstrating that the horse that is behind pulls more than his half of the load.

The effectual lever arm of the hind horse becomes shorter than that of the head horse as he is brought near the line of draft.

"It would, however, be a mistake to assume that the head horse always and necessarily has the advantage, as with one type of evener he actually pulls the most, and with a third type there is no difference in the draft of the two horses, eventhough one is ahead.

"Eveners can be so made that each horse is pulling its share of the load regardless of the position of one being ahead of the other."

Volume 22. SUSSEX, NEW BRUNSWICK, NOVEMBER 21, 1916. Number 4.

Fourth Annual Convention of the New Brunswick Women's Institute

St. John, N. B., Nov. 1, 2, 3, 1916.

Yes, it was the most entertaining and helpful Convention yet held. Some eight or nine Institutes were not represented, but nevertheless there were 127 members in regular attendance, with a number of members coming in for different sessions. All were of the same opinion as regards the practicability of meeting together once a year to discuss and plan future work and listen to the many interesting and beneficial reports, papers and addresses delivered. A feeling of good-will prevailed; new friends were made; old friendships strengthened and "I am willing to do my part" was pictured on every face. How could it be otherwise than a successful Convention?

Let me "begin at the beginning" and I do hope, not being able to go into detail, my report will be the means of helping all the Institutes, but especially the ones not having sent delegates. Really credit should not be given to me for this entire report, as having only a day or two in which to prepare it that it may be inserted in the November number of this Journal I am depending largely on the news given so generously in the St. John papers for my information.

The opening session was devoted to registration and the Supervisor's report which outlined the idea of a Women's Institute. It was for human beings—little children, the feeding of families, the avoidance of waste in homes, housework systematically arranged, furnishing the homes, all of which pertained and intended to develop a higher standard for community life. She urged a co-operative spirit with the Farmer's Institute. By it could be developed a rural social advancement which would rival town improvement, social leagues, boards of health, etc.

The work done during the last year brought forth the congratulations of the Supervisor. The amount collected or raised for war purposes amounted to $16,285.98; the amount expended on Red Cross work totalled $4,189.47, there still being on hand some $300.00 for patriotic purposes. During the year seven new branches were organized and 200 members added to the list. The total number of paid members are 2353; the number of regular meetings held 861; the total attendance at regular and Red Cross meetings reached 12373 and the number of papers read and addresses delivered amounted to 626 during the past year. Miss Winter related some of the methods used by the Institutes to help in their communities, to clean up the town, to encourage the Boy Scout movement, to assist the different institutions and to widen the circle of members.

She also spoke of the advisability of sending reports to the newspapers and the benefit that publicity brings to any good work. How to interest children and girls, and the high cost of living were subjects touched upon. The part women will have to take when the war is ended in building up the Empire should be carefully considered, also why we should buy "Made in Canada" goods.

Mrs. G. A. Kuhring, of St. John, most heartily welcomed the delegates to the city; congratulated all the Institutes on the effective work they were doing, especially of a patriotic nature. She said a very warm feeling of good fellowship existed between the women's societies of St. John and the Women's Institutes throughout the Province. She told with what interest she had watched the growth of the Women's Institute from babyhood to the large and influential organization it has become and wished them continued success in molding the life of this Province of ours.

Mrs. H. E. Ellis, President of the Woodstock Women's Institute, ably replied to Mrs. Kuhring's words of welcome. She dwelt upon the variety and wide scope of our popular organization and reviewed some of the ends which have been achieved through the instrumentality of the Women's Institutes.

Following Wednesday morning's session, a pleasant hour was spent in the afternoon at the Imperial Moving Picture Theatre, when all were guests of Mr. W. H. Golding, the manager. After the theatre party, the members returned to the Germain Street Institute where a delightful social hour was spent with the ladies of the St. John Red Cross Society. Over a cup of ten and dainty refreshments a general exchange of ideas took place and a channel was opened to add to one's list of friends. This social hour was much appreciated by the women of the Institute.

I was so glad to have the opportunity to tell what a perfectly wonderful time I had on my trip to the Canadian West, Alaska and the Western States this past summer. Listen you who were not present,—out of the five New Brunswick girls who won this trip by means of a newspaper contest, three of them were Institute girls. We were the first party of tourists to travel Grand Trunk Pacific right through to Prince Rupert and the trip was a revelation from start to finish. With a splendid road bed, comfortable train and steamer, courteous officials and a jolly party, we had a glorious time and frequently wished our friends could have been along to have enjoyed the many natural scenic beauties we were fortunate enough to see.

"Business and nothing but business" was the slogan for Thursday morning's session. With Miss Ella Thorne, of Fredericton, presiding, who is recognized as an authority on parliamentary procedure, a number of very important subjects were voted upon, discussed, and finally recommended in some instances for the Department of Agriculture to act upon.

Miss Lenna A. MacLean, of Centre Napan, moved, seconded by Mrs. S. M. Fiske, of Florenceville, that the Convention recommend to the Provincial legislature that women other than ratepayers become members of the rural school boards. Several women spoke in favor of this recommendation and one remarked that "the best man on the school board is often a woman." The New Brunswick law in this respect now permits that a woman can serve on the board if she is a ratepayer. Many women most capable to act are not ratepayers so the above recommendation would be a means of broadening the Act.

In the discussion re a Maritime Women's Institute Convention, the ideas of Miss Hazel Sterns, Supervisor for Prince Edward Island, and Miss Jennie Fraser, Supervisor for Nova Scotia, were listened to attentively and upon motion moved by Mrs. James Porter, of Andover, an unanimous vote was passed that a Maritime Convention take place after the war, and a committte composed of the Supervisors from New Brunswick, Nova Scotia and Prince Edward Island, arrange for same.

The next subject to receive attention was "Women's Work at Exhibitions" and the audience was much enlightened on this subject by the remarks from Mrs. John Harvey, of Fredericton, who said it was not so much the fault of the officials, in fact they were to blame very little, but the lack of interest on the part of the women. She urged hem to take a deeper interest and suggested the offering of prizes by the Women's Institutes at the various Provincial exhibitions. The pike show came in for severe criticism.

Mrs. H. D. Cleveland, of Albert, read a resolution adopted by the Toy Conference of Canada to the effect that only Canadian toys be purchased by the women of Canada and moved that the Convention put itself on record as in accord with the resolution adopted at the Toy Conference, Toronto. This was seconded by Mrs. Fiske, but Mrs. Harvey moved an amendment that all British goods as far as possible and Canadian goods

The Women's Institutes' Display at the Recent New Brunswick Apple Show.

The Red Cross in Apples, Red and Yellow.—Advertising booth of W. B. Gilman, Fredericton, N. B., at the Apple Show.

especially be purchased. This carried unanimously.

A resolution suggested by the Women's Suffrage Club of St. John was passed at this meeting, to the effect that women should be appointed on all boards of public institutions, schools, boards of health, etc., and that a copy of this resolution should be sent to the mayors of St. John, St. Stephen, Fredericton, Moncton and other cities, also to members of the legislature and of the governmtnt of this province.

As to Medical Inspection of schools, advocated by Mrs. Porter, the following resolution was adopted; "That it is the opinion of this Convention that medical inspection of schools would be beneficial to the youth of the land, and would advise that members confer with local school boards to bring about this measure." This is already a permissable law, so it is now up to the Women's Institutes to educate the people to the need of medical inspection. The school boards and Women's Institutes should be the means of arousing public sentiment and should co-operate in bringing to pass this important factor in the education of the child.

Ere this business session was brought to a close, Mrs. Porter of Andover, in recognition of her deep interest and valuable assistance in the work of the Women's Institute was unanimously voted a life member of the Provincial Women's Institute. Mrs. Porter was the first President of the first Institute organized in New Brunswick and largely through her efforts the organization was introduced in our Province in 1911.

The first speaker for Thursday afternoon was Miss Hazel L. Sterns, Supervisor of the Prince Edward Island Institutes. She brought the greetings and good will of the members from her Province, and said the Island has 42 Institutes and over 700 members. A supervisor and two assistants visit the branches six times a year, giving practical demonstrations of useful things in the profession of home-making. Great stress is laid on the closer relation of home and school and the use of schools as social centres is urged. Much patriotic work has been done. The short courses held in Charlottetown have been most successful; 200 have applied for next year's classes.

One of the ablest addresses during the entire Convention was that delivered by Mrs. N. W. Eveleigh, the efficient President of the Sussex Women's Institute. Her subject was "Possibilities of Women's Institutts." Said Mrs. Eveleigh, "they are as large as the opportunities which confront our women of to-day, as broad and far reaching as women's resourcefulness, which can convert remote possibilities into glorious achievements." Some of the plans for use fu ness suggested were the introduction of a bride to the Women's Institute, where she might find those who would help her in her new duties of house-keeping; also newcomers to a community should be welcomed and assisted. "Kindness extended to the stranger will return to us years hence in the increased efficiency of the children who are to be our Canadian citizens." Also the interesting of girls in the work, college graduates who have talents, and education which they can share. Conservation was discussed and the suggestion made that vegetable gardens were more profitable than flower raising, and that a pet cow should be made fashionable rather than a terrier. School children can be enlisted in the work of farming and can give much valuable help. Interest must be taken in school for the future children must be fully equipped to meet the after-the-war problems.

There was just the one demonstration given at the Convention. Miss Ada B. Saunders, Assistant Supervisor, demonstrated setting the table properly and serving a three course dinner without a maid. Her table was attractively arranged; the china was gold and white, and yellow flowers were used for decoration. Miss Saunders took for her text, "Simplicity and Perfection," and clearly impressed her audience with the fact that wholesome, well-cooked food served in an attractive manner is the motto for every housekeeper.

"Aim to be something with all your might" was the excellent hint given ing she presided. Miss Lenna A. by Miss Celia Peck during the evening she presided. Miss Lenna A. MacLean, of Centre Napan, read a very instructive paper for women on self-supporting. Miss MacLean said that country girls were invariably induced to go to cities because there was no way for them to earn a livelihood at home. The homes were very comfortable but the girls longed for the opportunity to become independent. As a means towards this end, Miss MacLean suggested canning and preserving clubs, the making of pickles, the cultivation of plots of ground, raising green groceries, sale of home-made delicacies which are always in demand,—cake, bread, candy, etc. Roadside tea-rooms, with gift-shops are almost always successful if well run. These practical suggestions were concluded with "the girl who thinks out what she wants to do then works, will win."

The rear end of St. Andrew's Rink, St. John, Apple Show week.

An address which was full of significence both from a social and commercial standpoint was that delivered by Dr. W. C. Keirstead, of the University of New Brunswick, who took as his subject "The Use and Abuse of Movies." Closely linked with the same subject was the address given by Mr. S. A. McFarlane, of the Provincial Normal School, who spoke on "Physical Culture as a Character Builder." These two features of the evening concurred in making the session one of the most profitable and interesting of the Fourth Annual Convention.

Dr. Keirstead said there is a great field for the movies providing stricter censorship. Many schools throughout the United States have moving picture machines of their own and throw on to the canvass the cities and places in foreign countries of which the children have been studying. He advocated the scheme of the mothers getting together for the purpose of procuring pictures from film exchanges that would be of educative value to the children, and then co-operate with the theatre managers and get the privilege of producing the pictures once a week at a small cost. He was also of the opinion that better results would be obtained if there was a federal censorship instead of a provincial. What passed for one province was good for all. The speaker advocated a woman being on the moving picture board of censors. A fine article published in the Christian Science Monitor was quoted from. Children's special programmes were advocated and the Women's Institute urged to lend their influence towards the betterment of the movies.

The effect that physical culture has on the uplift of the race was pointed out by Mr. McFarlane, who said that physical culture was now taught in every public school in the dominion. The purpose of physical training is not to fit the child to perform certain more or less difficult exercises, but to give him a stronger and more healthy body; to help in the production and mind, and aid him to approach more nearly to the ideal of perfect physical development. Physical training does not of itself impart strength. It only stimulates the various organs of the body to grow larger and stronger; but if overdone it has just the contrary action and produces weakness instead of strength. By means of the physical training rightly taught, the natural power of expressing thought, feelings and ideas by means of the bodily movements is encouraged and brought out. Physical culture develops quick obedience, and, said Mr. McFarlane, "if we teach our childrtn obedience at least we have accomplished something."

Miss Lilian Harren, St. John, was the first speaker at the morning session on Friday and delivered a short but interesting talk on "Classes in First Aid and Home Nursing". The Saint John Ambulance Association was a branch of the Red Cross Association of St. John of Jerusalem and the name had come down from medieval times. It was organized in Canada in 1910. The Ambulance Association does not intend to rival the skill of the physician, but to supplement his work. Thousands of lives had been lost through nothing beink known about how to apply a simple bandage or tournquet. Classes on First Aid and Home Nursing are flourishing in New Brunswick at the present time, and bandages, charts, instruction books and splints may be had by different towns on applying to the speaker for the purpose of organizing First Aid branches. To obtain permission to form an ambulance class $4.00 would be required to be sent to Miss Hazen by the proposed class as a whole. Three dollars of this amount is forwarded to Ottawa. An additional expenditure by each member of 55 cents, 35 cents for instruction book and 20 cents for bandage is all that is required. Any number under thirty may apply to be admitted as a class. A great number of assistant nurses have gone overseas from the Ambulance Association as assistant nurses. Miss Hazen thought possibly the Women's Institutes would like to form classes and she will be only too glad to give further information and supply literature. Her address is 95 Coburg Street, St. John.

It was a pleasure for us to have Miss Jennie Fraser, in charge of the Women's Institute work in Nova Scotia, with us again and all were greatly interested in what she had to say about the progress her Province is making in this splendid organization. Miss Fraser said since the outbreak of the war the Women's Institutes in her province had joined forces with the Red Crosses and the Daughters' of the Empire in patriotic work, and until December, 1915, had raised the sum of $7,970.32 for Red Cross, Patriotic and British Red Cross funds; $1500.00 for motor ambulance; had sent 162 boxes of supplies and contributed $692.27 to the Belgian relief fund. One Institute alone raised $1,001 and a small Institute $528.24. In August of last year in the County of Annapolis, through the urging of the Women's Institute, a large demonstration agricultural building was erected by the Farmers' Association of Annapolis county, the County Association and the Department of Agriculture. The building has a large assembly hall, a demonstration room in the rear and rooms for men and women organizations. Two successful courses have been given to men and women since last fall, and the average attendance was about one hundred. The building represents the social and practical sides of life and more buildings of a like nature would keep the youth of the province at home after the war.

Mrs. John A. McAvity, President of the St. John Red Cross Society, gave a very helpful talk on the work of the Red Cross Society. She dwelt upon the needs of the soldiers and said that socks and pyjamas were especially needed. Mrs. McAvity showed a model comfort bag and answered many questions touching upon the Red Cross work. By writing to Mrs. McAvity, 58 Orange Street, she will be glad to answer any further enquiries and forward any literature dealing with Red Cross work.

Friday morning's programme was concluded by Mrs. James Porter conducting a Model Institute meeting. The members answered roll call with quotations; the secretary read the minutes of the previous meeting. Reports from various committees were then given and under "new business" the advisability of implanting a rest-room in the town was discussed at considerable length, with the result that a motion was passed, an amendment made to the motion and an amendment made to the amendment, the latter being voted upon first, then the amendment and finally the original motion carried. For the entertaining part of this model meeting, Mrs. Herbert Trites, of Petitcodiac, recited "Brother Jonathan," and Miss McLauchlan of Buctouche, nicely executed a piano solo. Keen interest was taken in this "meeting within a meeting."

Dental Education as applied to Women's Institutes" was a subject allott-

ed to Dr. R. B. Hagerman of East Florenceville, and his paper was splendid in every way. The lack of knowledge of dental science was shown to be very general. The absence of care given to the teeth, the evil result of this neglect and the remedy were pointed out by the speaker. It would be a splendid thing to have a dental inspector in the schools and New Brunswick is far behind the times in this respect. Dr. Hagerman gave directions for classes in dental science, how they could be formed in city, town or village and that there are lectures and slides available for such classes. He suggested that the Women's Institutes might undertake this work.

Throughout the sessions Mr. Gordon Rogers, of Ottawa, secretary to Dr. F. Montozambert, C.G.M., director-general of public health and sanitary advisor of the Dominion Government, had been heard from several times in some excellent readings, most of them humorous, but after hearing his educative paper on "Home and School Sanitation" one could readily understand that there was a serious side to his nature. His paper showed careful thought and preparation and Mr. Rogers, who long since has won an enviable reputation as an excellent reader, held his audience from beginning to end and gave some good, sound advice. In the course of treating his subject he laid down the following as the principal rules for the prevention of germ diseases: Destroy the germs that come from the bodies of the sick; take care of wounds, protect yourself from biting insects, guard the mouth and nose, and keep the body healthy so that it will be able to kill disease germs. He said that the great reason why indoors people are not nearly so well in the winter as in the summer is due simply to the fact that in the winter they are breathing bad air nearly all the time.

As a prescription that would not necessitate one as a sequence from a doctor, he gave this: Fresh air, pure air, nourishing food, dry feet, warm feet, and plenty of sleep, especially for growing children, and enough exercise.

Taking up another phase, Mr. Rogers said that on the skin and in the throat of most persons, at all times, germs that cause disease may be found. They attack different membranes and different organs, and he emphasized the fact that the man who abused the use of alcohol has mighty little chance against the poison of the germ of pneumonia, but at the same time there is little doubt that the resistance of the body in a large percentage of cases has been largely weakened by a lack of fresh air. It is a commonly accepted and well known fact that alcohol lowers the vitality.

Mr. Rogers citied the report of a professor from Columbia University, who had made an investigation of the school conditions in Canada. The report showed that old buildings, bad buildings, neglect of premises, weed grown yards, unsanitary outhouses, no water supply, bad lighting, and bad heating, dirt and overcrowding were among the most glaring defects.

Among his closing remarks he made assertion that the child should be led to expect health and happiness, and instead of being taught to resignedly accept suffering, the child should be taught to demand health and to have a pride in physical vigor and well being rather than in fortitude under pain.

It would never do to conclude this information about our Convention without referring to the many branch reports read at different times during the sessions. They were brimming over with activity and invariably gave results of the splendid work being accomplished for home and country. It was a disappointment to all that only about half of the Institutes were heard from, but time would not permit of any more being read.

A piano solo here, a vocal solo there with occasional readings made each session that much more entertaining. There was a general exchange of programmes and Women's Institute literature. An Autograph quilt on exhibition attracted much attention. This was the work of the Glassville Women's Institute and netted for them the sum of $30.00. In addition to autographs neatly inscribed in ink, many of New Brunswick's animals were represented in different places on the quilt and much credit is due the artist in the Institute for the excellent ink drawings.

There was also a very good exhibition in handicraft at the Convention rooms, including basketry, with several fine trays of native wood, the edges of woven reeds stained. Stencil work in artistic designs was shown on crash used for centrepieces, pillow tops and table runners. Some tooled leather articles were included in the exhibit and the entire display was the accomplishments of the Women's Institute members while attending the 1916 Winter Short Courses. Some articles were sold and more could have been disposed of if the owners had been willing to sell them.

Following the interesting discussions resulting from the Question Box, Miss Thorne moved a vote of thanks to the Supervisor and all who had assisted in any way in making the Convention such a help and so successful. This motion was quickly seconded. The Convention also declared itself in favor of governments and cities giving every preference to returned soldiers in making appointments to positions of any kind. The One Hundred and Thirty-five Dollars left over from the Ambulance Fund was voted to be donated to the Canadian Red Cross Society.

The Apple Show which was held on the same dates as the Convention attracted large crowds and was declared to be the best Apple Exhibition ever held in New Brunswick. This was held in St. Andrew's rink and on the left of the entrance was tastily arranged a splendid array of collections of home grown, preserved and canned, dried and pickled or put up in any way intended to prolong keeping qualities for food purposes, fruits and vegetables, displayed for competition by the Women's Institutes of New Brunswick. The Institutes taking part in this competition, and the number of jars in the respective collections were as follows, the first six in their respective order being the prize winners:

1st, $14.00, Sussex,	58
2nd, $12.00, Lower Millstream	37
3rd, $9.00, Florenceville	25
4th, $7.00, Lower Kingsclear	43
5th, $5.00, Hopewell Hill	14
6th, $3.00, Kennebecasis Valley	35

Codys 14; Lake George, 23; Stonehaven, 34; Newcastle, 13; Minto, 11; Smith's Creek and Newton, 24; Blackville, 28; Hartland, 7; Salmon Beach, 7; Poodiac and Jeffry's Corner, 18; Hammond and Marknamville 12; Albert, 18; Welsford, 28; Leverville, 20; Andover, 44; Clifton, 17.

POTATOES FOR CHEAP FEEDING

At first glance the reader will naturally repeat "Potatoes for Cheap Feeding?" His mind will revert to the recent market reports from some sections of the Maritime Provinces, where prices have soared to $4.00 per barrel and prodictions are out for the five dollar mark before our next crop is harvested.

However, when we refer to potatoes for feeding, we invariably refer to potatoes of unmarketable size and quality. How to dispose of them to best advantage is a problem that often confronts the extensive growers.

Potatoes not only have a high food value, but medicinal properties as well. The following extracts from a bulletin published by J. W. Helme, State dairy and food Commissioner for Michigan, will interest our readers:— Potatoes at from 35c to 40c a bushel are the cheapest form of starch food, and starchy foods are absolutely necessary to the human system for a production of heat and energy.

Nearly 5 percent of the dry substances of the potatoes consists of salts, largely potash. These salts have the medicinal properties of purifying the blood from acids produced by the eating of meat, which, in the human family, is the chief cause of hardening of the arteries, gout, rheumatism, Bright's disease, and apoplexy. These salts are located just under the skin of the potato for which reason potatoes should not be pared before cooking.

The comparative nutritive value of potatoes is as follows: One pound of baked potato has the same food value as five and seven-eighths ounces of beef, one pound of chicken, 10 pints of beef tea, or seven ounces of bread.

It has been known for some time that if hog rations were occasionally varied with the feeding of boiled potatoes, that there was no tendency to hog cholera or other of the common diseases of the hog family. In fact, R. A. Heesen, manufacturer of the well-known Heesen Stock Food Cooker, whose experiments over the last two or three years almost qualify him as an expert, states that he believes that if a farmer will feed a balanced ration of cooked feed, which includes an occasional feeding of boiled potatoes, that he can almost guarantee that there will be no hog cholera or other diseases of like character on his farm—that his stock will fatten faster, and be ready for the market sooner, at a less cost than by any other method.

From the facts we have at hand, it certainly seems as though this method was worth trying.

NEW LIVE STOCK COMMISSIONER FOR NEW BRUNSWICK

The resignation of Professor J. W. Mitchell from the agricultural staff of the Province of Manitoba, who has accepted a position upon the staff of the Department of Agriculture in this Province has evidently created quite a stir in the western province. The following appeared in the columns of the "Manitoba Free Press" on October 26th:—

"St. John, N. B., Oct. 26.—By Order-in-Council passed to-day, Prof. J. W. Mitchell, Manitoba, was appointed Commissioner of Livestock and Dairying for the Province of New Brunswick.

"This dispatch was received in the Free Press office last evening and on communicating with Prof. Mitchell at his home in Fort Rouge, he confirmed the dispatch as correct.

"Intimate friends of Prof. Mitchell have been feeling very uneasy for the past ten days, for about that time J. B. Daggett, Secretary of Agriculture for the Province of New Brunswick, a position corresponding to that of Deputy Minister, was in Winnipeg and had several long conferences with Prof. Mitchell, and as he let drop that his province was looking for a good dairy man, it was feared that they were casting covetous eyes in the direction of Winnipeg, and now it seems that the forebodings of the dairy men were only too true. Prof. Mitchell, when asked for confirmation of the appointment, admitted that it was a better one, financially, than that which he now occupies, and while he regretted leaving the west, he looked forward with considerable pleasure to renewing old friendships in the Maritime Provinces, and carrying forward still further work which he set going when he was Dominion superintendent of the dairy work in the Maritime Provinces from 1901 to 1903."

"The editorial columns of the Farmers' Forum has always tried to do something like justice to the valuable work which Prof. J. W. Mitchell has done for dairying, and now it is hardly necessary to say how deeply we regret his removal from the province. There is something wrong with our province somewhere when little old New Brunswick can offer a live progressive man like Prof. Mitchell a more attractive proposition than a new province like Manitoba. What's wrong with us anyway? We are always losing good men out of our public work, either to the east, the further west or the south."

The "Winnipeg Tribune" of October 26th contains the following tribute to the worth of Professor Mitchell:—

"Professor J. W. Mitchell, head of the dairy school at the agricultural college and commissioner of dairying for the province of Manitoba, announced Wednesday he has accepted the position of commissioner of livestock and dairying for the province of New Brunswick.

"Negotiations were conducted by J. B. Daggett, Secretary of Agriculture for New Brunswick, who has been in Winnipeg for the last few days.

"Professor Mitchell has had a distinguished career. From 1896 to 1899 he was instructor of dairying at the Ontario Agricultural College at Guelph. From there he was sent west by the Dominion government as dairy superintendent for Saskatchewan and Assiniboia territories. In 1901 he was transferred to the Maritime Provinces and later he became principal of the Kingston dairy school.

"In 1908 Prof. Mitchell came to Manitoba. He improved the reputation of Manitoba butter with such success that now it is exported to the British market extensively. He introduced grades for cream and butter fat to protect the public."

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

WHAT A MAN SOWETH.

In season and out of season the Maritime Farmer has persistently advocated the use of good seed and repeatedly explained the methods followed by our most progressive and thoughtful farmers, for setting a sufficient quantity of their best grain aside for seed purposes.

An old scriptural adage says: "What a man soweth, that shall be also reap". In every day parlance this means that if a man soweth good seed, other conditions being favorable, he may expect to reap a bountiful harvest. But under the same conditions if poor seed is used, just as surely as day follows night, the harvest will be unprofitable. The use of good seed lessens the cost of production and this is what every farmer should aim for in the present time of strain and stress.

Of so vital importance to the success of farming is this question of good seed, that we again bring the matter to the attention of our readers.

Now is the time to get the fanning mill rigged up and the seed well cleaned before the rush of spring work begins. In too many cases this is put off until the last minute, and then there is not sufficient time to do the work thoroughly. Sometimes it is put off altogether, and the seed sown just as it comes from the threshing machine.

The first business of the fanning mill is to take out the weed seeds, and if properly handled, nearly all the mills on the market will do the work well.

Every weed seed that is taken out of the grain means so many less weeds in the field, a fact that is worthy of remembrance. The fanning mill also takes out all broken straws and chaff so that the grain will feed readily in the drill.

Authorities are doubtful as to the value of the fanning mill as a means of improving the quality of the seed itself. Experiments conducted in the United States have shown practically no increase in production in favor of the use of large, plump seed. However, the yield from the large seed was always as good as that from the lighter seeds. In this country, where we are subject to late frosts in the spring, we believe that results of experiments along these lines would be in favor of the large seed for the reason that the young plant would derive more food from the kernel, and thus be stronger, until it was able to assimilate food from the soil.

While the use of the fanning mill will not improve or increase the productive power of our grains (this must be done by hand selection) it is a useful and indispensable agent in keeping our seed free from noxious impurities.

So clean, re-clean and clean again your seed grain, and—do it now. Make it your stormy day job. It pays.

WHEN FARMS PRODUCE MORE.

It is a fact, as shown both in this country and in Europe, that no section has ever maintained its wealth in agricultural products for any considerable length of time without animal husbandry as the main industry or to supplement general farming. True, when a section of the country is first brought into cultivation the soil, being virgin and very fertile, may produce in abundance and it would appear that fertility is exhaustible. But experience teaches that crops, when they are sold and removed from the farm, soon reduce the humus and fertility constituents so that the land no longer produces profitably.

Animal husbandry is necessary for permanent fertility. It is essential to general farming in that it reduces waste, obviates the necessity of marketing such bulky products as hay, fodder, grain, etc. It distributes labor, in many instances providing work for the men and teams when crops do not demand attention.

The problem of feeding the people is the greatest with which we are confronted. We have advanced so fast in city production and industries other than farming that food production has not kept pace. Without an abundance of food no people can make great progress, nor can they remain in peace and contentment. Our farms are now required to supply the people with meat as well as bread. In the West ranches have been converted into farms in many sections. The sudden transition from ranching has diminished the supply of livestock faster than the small farms can meet the deficit. This means that if our section of the country is to maintain its standing plans must be provided for raising more animals on small farms.

Before this can be accomplished more feed crops must be produced. More feed stored and more animals fed. This will mean greater investment, as livestock represent considerable capital; barns, creameries, dairies, silos, etc., must be built. This will require cooperation on the part of the banks and other business men, but it is cooperation that will build. Capital wisely invested in livestock, silos and other farm building means more wealth not only for the producer, but for the country. It means larger crops, better profits, better schools, good roads and progressive agriculture in all that it signifies.

AWAY WITH THE DOGS.

An Exchange says:—

"Undoubtedly the question of cost of fencing and shelter is the greatest objection to sheep raising on the average farm."

To this we would add raids by worthless dogs. While conversing with a prominent sheep breeder in the vicinity of Sussex, a day or two ago, one, who by the way brought in the most wool to the local wool growers centre last spring—he told us that he had disposed of his entire flock owing to the ravages of dogs during the fall and summer months. Discouraged? Yes, discouraged by seeing his best ewes and lambs torn, bleeding and dead and the profits expected and in sight, wiped away by the ravages of worthless dogs that are so safely entrenched behind a worthless dog act. Like Lincoln's immortal "Are slave owners the best lawgivers on slavery?" it seems that dog owners are the law givers for the protection of the sheep industry, and consequently the sheep industry is waning while the mangy curs are rolling in luxury. The situation is critical and calls for an immediate remedy. Save the producing industry by doing away with the blasted dogs.

VEGETABLES NECESSARY TO HEALTH.

Sixty-two per cent of the patent medicines sold are patent laxatives. If people regulate their diet proprly and include more green stuffs they will not need laxatives. Seventy-five per cent of the people do not eat enough vegetables to keep them well. Some doctors estimate that sixty per cent of the deaths are due to indigestion, constipation, and effects which follow.

If we can the fruits and vegetables from our own farms, which would otherwise go to waste, we shall have a supply for use on our own table—foods which we need to keep us healthy and make us grow strong—and we can have a more varied and so more pleasing diet. Why should we eat only meat, bread and potatoes three times a day, 365 days in a year?

Those who grew vegetables should use their produce. When there is so much want in the world it is selfish and wicked to let any good food go to waste.

If there is more than is needed for use at home, it may be sold.

Sometimes it is hard to sell garden produce fresh, because everyone has all he can use. But if the produce is canned and put on the shelf until the fresh vegetables and fruits are gone, then people will be glad to pay a good price for the canned foods.

UNDERDRAINAGE.

Not a few men fail to perceive just what underdrainage really is and what it accomplishes. Owning rolling land they remark that they need no drains, since the water readily runs off of their land. But that, indeed, is exactly what we wish to avoid—the running off of water. On well-underdrained soils the water sinks in and is steadily discharged by tiles; the excess water is taken out of the land. It is to get the excess of water out of the soil that we underdrain. Underdrained land is less dry than undrained in time of drouth. This is because the soil gradually deepens, the roots extend farther downward and so all the soil is better used. There are yet thousands of acres in the Maritime Provinces needing underdrains of tiles. We attacked the marshes first, as was best. Now remain the undulating lands which in many instances will be more profitable when underdrained.

Editorial . .

* * *

In figuring the returns from sheep, the lambs and wool are not the only legitimate sources of profit. Sheep are continuously at war with weeds of all kinds. Only when they lie down together—with the weeds inside—is there peace. It is impossible to place a money value on this service which they render.

POTATO SEED BALLS.

In our issue of February 22nd, we published an article from the columns of Literary Digest entitled "Wanted—Potato Seed." We have received several letters recently from parties in the Maritime Provinces who read the article in question and who have secured a quantity of potato seed balls in their fields this fall.

Edward F. Bigelow, writing in The Guide to Nature (Sound Beach, Conn., January) says that the plant Wizard, Burbank, of Santo Rosa, California, explains that "Potatoes have been grown so long from cuttings that they are getting out of the habit of producing seed. Seed for breeding purposes is in demand and worth six dollars a thimble-full when the thimble-full can be secured.

Professor Gully of the Connecticut Agricultural College, Storrs, Connecticut, made the assertion thirteen years ago that "all the fruiting berries of the potato have disappeared from the State. I will given twenty-five dollars for one found in Connecticut."

Mr. Bigelow says that he has searched in vain to prove that Professor Gully is wrong, but he must limit his claim to Connecticut. Although it would not cost him a fortune should be extend to the United States in general."

Mr. Bigelow offered a year's subscription to The Guide to Nature for a box of well developed seed-balls, before conventions of over 2000 teachers in Ohio, Indiania and Pennsylvania. The announcement was received with surprise and the remark: "We can send them to you by the bushels. We will bankrupt you on subscriptions."

Nevertheless, only a dozen responded and no package contained more than eight or ten balls, and nearly all of these were vestigal. The writer says that in thirteen years not more than thirty large, smooth, round, perfect specimens have reached me. As a result of my efforts during the past summer, I have obtained at a cost of six dollars, less than a thimble-full of seed.

The Department of Agriculture of the State of Maine says:—

"'I do not know of any one at present who is experimenting in growing potatoes from seed. The season has been so bad here in southern Maine that I have not seen any mature seed-balls. I have some at home in a little vial, probably several hundred. These are several years old, and I do not know whether they would germinate or not.'....

"The more extensive the correspondence the more one is inclined to agree with the great Dreer seed-house of Philadelphia when it writes:

"We regret to say that we are unable to furnish you with the potato-balls and do not know any source of supply for seeds.'

"Readers, this is an alarm-cry. Potato-seed is going from this country. All that can be obtained should be put at once into the hands of competent experimenters.

"What are we going to do when the present varieties of potatoes have 'run out,' and no more seed can be obtained?"

Seed selection must play an important part in the future development of the potato crop. It is a work that is worth while and we strongly recommend to our readers the advisability of getting in touch with the Canadian Seed Growers' Association, Ottawa, and learning from it the best methods to pursue in the selection of seed potatoes.

While attending the Yarmouth Exhibition last month we had the pleasure of meeting Mr. Jas. Rozee of Yarmouth, who is conducting experiments on growing potatoes from seed-balls.

In the spring of 1915 Mr. Rozee planted the seed from one potato ball taken from a Green Mountain vine and in the fall he harvested fifty very small potatoes of various shapes that totalled 3½ ounces in weight. As many of these as survived the winter were planted in the spring of 1916 and this fall he harvested therefrom thirty-five pounds of potatoes. Many of the potatoes were of excellent type and of marketable size. Mr. Rozee will continue his experiment in 1917, with the various tpyes thus produced.

There were some excellent Green Mountain types, then there were some types similar to that of the Irish Cobbler, and again some of the specimens were long and narrow and some dumb bell shaped. All these types produced from seeds, contained in one seed-ball, for when we plant potato seed it is like planting apple-seeds, for we do not know what will happen. The seeds seem to become insane and try to produce a little of everything. Fortunate is the experimenter that finds in the varied potato-seedlings some particular form that may be better than the original.

We will ask Mr. Rozee to describe his experiment more fully in a future issue.

In the meantime the readers who are interested in the seed-ball question would do well to communicate with the various parties mentioned in this article.

Milk may become contaminated in many ways, and anything that we do to keep dust and dirt out of the milk-pail means milk of better flavor and better keeping qualities.

SOME FLEASURES OF RURAL LIFE

A well-kept garden on the farm will supply fresh fruits and vegetables for the table.

NEWS ITEMS FROM THE AGRICULTURAL COLLEGE, TRURO, N. S.

The winter session of the Agricultural College at Truro, N. S., opened on Nov. 1st. The enrolled attendance to date is 49, being composed of 15 seniors and 34 juniors. A considerable addition is expected before the term concludes, but, even as it is, the attendance is very satisfactory indeed, and fully up to the expectations of the faculty. Included in the student body are students from New Brunswick and Prince Edward Island as well as from Nova Scotia itself.

The College live stock is in magnificent shape at the present time. There are several Holsteins that are making over 75 lbs. of milk per day, and among the Ayrshires is a two year old heifer that is now milking on her third month and still gives 50 lbs. per day, having given as high as 54 lbs. in one day. Bonnie Jean, one of the College Ayrshire cows, in fact the dam of the stock bull at the present time, has completed the third month of her present lactation period, and is still giving over 60 lbs. of milk per day. Jean Armour's Lotus Laddie that was selected jointly by the College management and C. P. Blanchard to head the Ayrshire herds on their farms is developing splendidly. His uterine sister, Jean Armour 3rd. has recently broken all previous records for the Ayrshire breed, having made a three year old record of 21,938 lbs. of milk and 849.18 lbs. of fat with an average percent of 3.88 fat. Jean Armour herself, the dam of the College bull, and of Jean Armour 3rd. was the first Ayrshire cow in the world to give 20,000 lbs. of milk in a year, and she did this when she was twelve years of age.

The arrangements are now being completed for the short course which is to be conducted from Jan. 2-11 next, an advertisement of which appears elsewhere in this number. The College management have been very fortunate in securing as the special extra attraction for the course the services of Dr. C. A. Zavitz of Guelph, who is recognized as America's leading field crops expert. It will pay farmers from all parts of the Maritime provinces to come to the College if for no other purpose than to take in the course of lectures and demonstrations by Dr. Zavitz, especially when in addition to this they will have the opportunity of seeing and judging the magnificent collection of live stock owned on the College Farm and receive instruction in Veterinary Science, Horticulture, Dairying and the Allied subjects. Those who can spare the time cannot afford to miss the opportunity.

The College has suffered a severe loss in the death of Professor B. H. Landels who was in charge of the drainage and experimental field crops work. He enlisted over a year ago and went to the front with the rank of Sergeant with the famous Princess Patricias. He was promoted on the field to the rank of Lieutenant, and is now reported missing and believed killed. One of his fellow officers says that the last he saw of Landels was when, at the head of a group of men, he was making a charge on the German trenches. His fellow officers and the men in the ranks all held Lieutenant Landels in the highest esteem. He was one of the strong men on the College staff and was universally appreciated and respected.

HORTICULTURE

LEAVES FALLING IN UNSPRAYED ORCHARDS BEFORE THE SPRAYED

In comparing the fall of the leaves in the sprayed and unsprayed orchards, we may at this time of the year see the reason for one orchard having a full strong bloom next spring while the next orchard may have a short weak bloom. Other conditions, such as cultivation, being equal the sprayed orchard will invariably hold its leaves later in the fall and so develop a stronger better fruit bud for the following spring. One of the best instances of this was in Prof. Brittain's Experimental orchard at Bridgetown last season. In 1915 ten sprayed Golden Russett trees gave a crop of apples worth $2.46 per tree and held their leaves until Nov. 5th, while ten unsprayed Golden Russett trees in the next row averaged 69½ cents worth of apples per tree and dropped their leaves about Oct. 20th.

This spring the ten sprayed trees had a fine full coat of blossoms while the unsprayed trees had practically no bloom. The cultivation and the fertilizing in the two rows has been identical for three years.

It is unseasonable to expect a tree which drops its leaves early in the fall to form as strong and as healthy fruit buds as the tree which holds its leaves until the frost kills them. Spraying, therefore, not only keeps the crop of the current year clean, but it increases next years crop more than any other single factor. This is the reason why men who spray continuously and well are almost without exception getting continuous crops of apples, while their neighbours who do not spray may have one enormous crop followed by two or three off years.

Compare some orchards in regard to the dropping of the leaves.—G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S.

CHOOSING SEED POTATOES

The question of choosing seed potatoes is sometimes a puzzling one. It is hard to decide whether it will be the most economical to select the smaller ones so as to save the larger ones for market or home use, or whether to select good-sized tubers for seeding. The fact that the small seed potatoes produce a much smaller tuber and a smaller yield, should convince us once and for all time that the man who selects culls and small seed potatoes is practicing false economy. No wonder some complain that their seed is running out. If we selected the inferior seed and inferior animals for propagating purposes, it is folly to expect good results.

A PRODUCTIVE TREE

In the orchard of Mr. John Tobin of this town is a Spy apple tree which established what we think is a record for productiveness. In the different years Mr. Tobin has obtained the following number of barrels of fruit, 1910, 15 bbls; 1911-15½; 1912, 18; 1913—4; 1914—20; 1915—5; and in 1916—21 barrels. At the prices ruling this year Mr. Tobin will find this tree a very present help in times like these in helping to keep the coal bin and the flour barrel and sugar bag filled.—The Advertiser, Kentville, N. S.

THE CANKER WORM

We again beg leave to call the attention of apple growers through out the Valley to the very serious outbreak of Canker Worm recently at its height, and to remind them that the best method of combatting Canker Worm is to band the trees with tree tanglefoot between the 20th and 25th of October, so as to prevent the ascent of the wingless females or slugs.

A summary of the Canker Worm life-history is as follows;

The winter is passed in the egg state, the eggs being deposited in very irregular patches or clusters on the limbs of the tree. About four or five days before the apple blossoms to poison as they grow. In the caterpillars emerge and feed on the leaves, often defoliating entire orchards and getting more difficult to poison as they grow. In the caterpillar stage they are popularly known as measure worms or inch worms, and may be solid green or striped with black, depending on their maturity. About the end of June they drop to the ground and burrow down about one inch and there pupate. About the first of November the adults appear; the males, small winged moths, which may be seen flying about the trunks of the apple trees, the females, small wingless slugs, which crawl up the trunks of the apple trees to deposit their eggs on the branches.

The best method of combatting the Canker Worm is to place a band of tree tanglefoot from two to three

HERE'S A REAL PUZZLER FOR WISE HEADS

JOHN BROWN is noted for being the livest merchant in town because of the novel way in which he advertises and creates interest in his well known grocery store. Recently Mr. Brown presented a clever problem to his customers. It is one that will give much amusement and entertainment to every puzzle lover. Look at this picture of Mr. Brown's Store, and you will see his idea. He carefully covered the labels of the boxes, barrels, and bins containing fourteen of the staple lines of his stock. Then he engaged a clever cartoonist and had him draw a series of puzzle pictures to be used as labels to represent the names of the hidden goods. The Artist caught the spirit of the idea, and at once drew picture No. 2 to represent currants (currants). Then he drew picture No. 4 as a label for tomatoes (Tom-eight-O's). With these two names to start you and the grocery list at the left of the picture by way of suggestion can you find what the other twelve represent?

2nd Prize—Famous Indian Motorcycle. Value $300.00

1917 Overland Touring Car

FIRST PRIZE FOR THE BEST REPLY

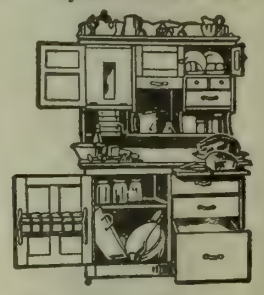
$1,000.00 IN OTHER GRAND PRIZES TO BE AWARDED

They include—

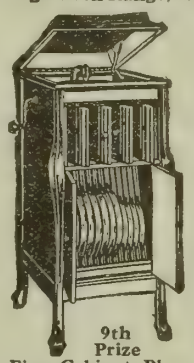
$300.00 Indian Motorcycle	$60.00 High Oven Range
Cabinet Phonograph and Records	Waltham Watches
$45.00 1917 Cleveland Bicycle	$50.00 Hoosier Kitchen Cabinet
$48.00 Singer Sewing Machine	Perfection Oil Range
Cabinet of Rogers Silverware	1900 Washing Machine
Handsome Mahogany Dressing Table	Wrist Watch
and a host of other Grand Prizes too numerous to mention here.	Beautiful Sets of Books

BIG COMPLETE PRIZE LIST SENT TO YOU DIRECT

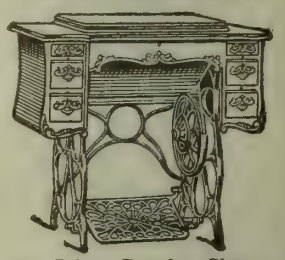
3rd Prize—Clare Bros. Famous High Oven Range, Value $60.00



6th Prize—Famous "Hoosier Beauty" Kitchen Cabinet



9th Prize Fine Cabinet Phonograph Complete With 6 Records



4th Prize—Genuine Singer Drop Head Sewing Machine

THIS CONTEST IS ABSOLUTELY FREE OF EXPENSE TO ALL
You are not asked to spend a cent of money or buy anything

A FEW HINTS—To aid you a little a suggested list of groceries kept in Brown's Store is alongside the picture. A good plan is to study the list and write down the name which in your opinion best fits each picture. All the names represent articles in everyday use and which are to be found in any grocery store. No trademark names or special manufacturers' names are used, so with these few hints and a little thinking you should be able to solve all the pictures. Note that 10 points toward the prizes are given for each correct answer and that if your answers gain only 200 points you win first prize. (See Rules).

THE OBJECT OF THE CONTEST—Frankly this great event is intended to advertise and introduce EVERYWOMAN'S WORLD, Canada's Greatest Magazine, to hundreds of new homes, which should know that a magazine of such excellence and real worth is being published right here in Canada by Canadians for Canadians. You can easily help us to do this when you enter the contest, but you do not have to be a subscriber nor are you asked or expected to take the magazine or spend a single penny in order to compete and win the touring car or one of the other magnificent prizes.

EVERYWOMAN'S WORLD is now the established favorite in more than 130,000 of Canada's best homes. Though that is the greatest circulation ever attained by any Canadian magazine, it doesn't satisfy us. Our motto is "Everywoman's World in Every Woman's Home." Hundreds of Canadian homes which may not know it now, will welcome this handsome, interesting, up-to-the-minute magazine, and once it is introduced, they will want it every month.

Therefore, when your answers are received, we will write and tell you the number of points you have gained toward the prizes, and send you Free a copy of the latest issue of this greatest of Canada's magazines. Then, in order to qualify your entry, we will ask you to do us the small favor of introducing it to just five friends or neighbors. We will even send you sample copies to leave with each of your friends, if you wish. State your willingness to accord this favor when you submit your answers. The company agrees to pay you in cash, or reward you with a handsome gift for your trouble, entirely in addition to any prize your entry may win in the contest.

Follow These Simple Rules When Sending Your Entry

1. Write your answers in pen and ink, using one side of the paper only. Put your name and address on the upper right hand corner. Anything other than your name and address and your answers to the picture must be on a separate sheet. Do not send fancy, drawn nor typewritten entries.
2. Boys and Girls under 14 years of age are not allowed to compete, nor are the members and employees of the Continental Publishing Co., Limited, EVERYWOMAN'S WORLD, nor any of their relatives or friends.
3. Contestants will be permitted to submit as many as three sets of answers to the puzzle, but only one set can be awarded a prize.
4. If different members of a family compete, only one prize will be awarded in one family or household.
5. The final awards will be made by a Judging Committee of three Toronto gentlemen who have no connection with this firm, and contestants must agree to abide by the decisions of the Judges. The names of the Judges and the manner of the judging will be made known to all contestants. The prizes will be awarded according to the number of points gained by each entry. 200 Points, which is the maximum, will take first prize. 10 Points will be awarded for each correct answer, 20 for the general neatness and appearance of the entry, 10 for handwriting, and 50 for fulfilling the conditions of the contest. The contest will close April 30th, 1917, immediately after which the judges will award the prizes. Entries should be forwarded promptly. Each competitor will be required to show the sample copy of EVERYWOMAN'S WORLD, which we shall send, to four or five friends or neighbours who will want to subscribe. For this service, the Company guarantees to reward you with cash payment or a valuable prize. Such rewards to be entirely in addition to any prize your answers may win in the contest.
6. Contestants are not required to be subscribers or readers of EVERYWOMAN'S WORLD nor are they asked to subscribe or to buy anything. In awarding the prizes, the Judges will have no knowledge of whether the entry comes from a subscriber or not.
7. Address, Contest Editor, Everywoman's World, Continental Publishing Co., Limited 1113 Continental Bldg., Toronto, Ont.

inches wide around the trunk of the tree and so prevent the females from depositing their eggs.

Home-made tangle foot may be made by boiling 9 lbs. of resin, 7 pints castor oil and ¼ lb. of parrafin or beeswax together. If found to be too hard, add more oil, if too soft add more resin, tempering to suit temperature.

Commercial tree tanglefoot may be obtained from any of the agencies of the United Fruit Company in the province and is probably better and as cheap as the homemade article.

When the orchard is infested with Canker Worm and banding is not practiced, a very thorough application of poisoned spray immediately before the blossoms next spring, when the young caterpillars are very small and so most easily poisoned, is all that can be done to prevent defoliation in an orchard.—G. E. Sanders. Field Officer Dominion Entomological Laboratory, Annapolis Royal, N. S.

EMBARKING IN BEEKEEPING INDUSTRY

Editor Maritime Farmer,

Letters are coming to me almost daily from persons wishing to make a start in beekeeping, who desire certain information. The questions are practically the same in each case. It has occured to me that by publishing the questions from one such letter and my answers to them, many others might reap the benefit.

The letter runs about as follows;

"I have just come here and bought a small farm and intend keeping bees. May I ask you to give me some information about them. What are the best kinds for this province? When is the best time to begin beekeeping? What about keeping them through the winter? Have you any bees to sell?

The answer:—Answering your questions in the order they were asked we would say that there are but two kinds of bees that find a place in this province, viz. Black bees and Italians, of which the former are very much in the majority. We have no data, or experimental evidence, as yet to show which is the better breed, or the one best adapted to conditions as they are found in this province. For our own part we very much prefer the Italians, and we know that where beekeeping is carried on in a large way, only Italian bees, except in limited cases, get any recognition.

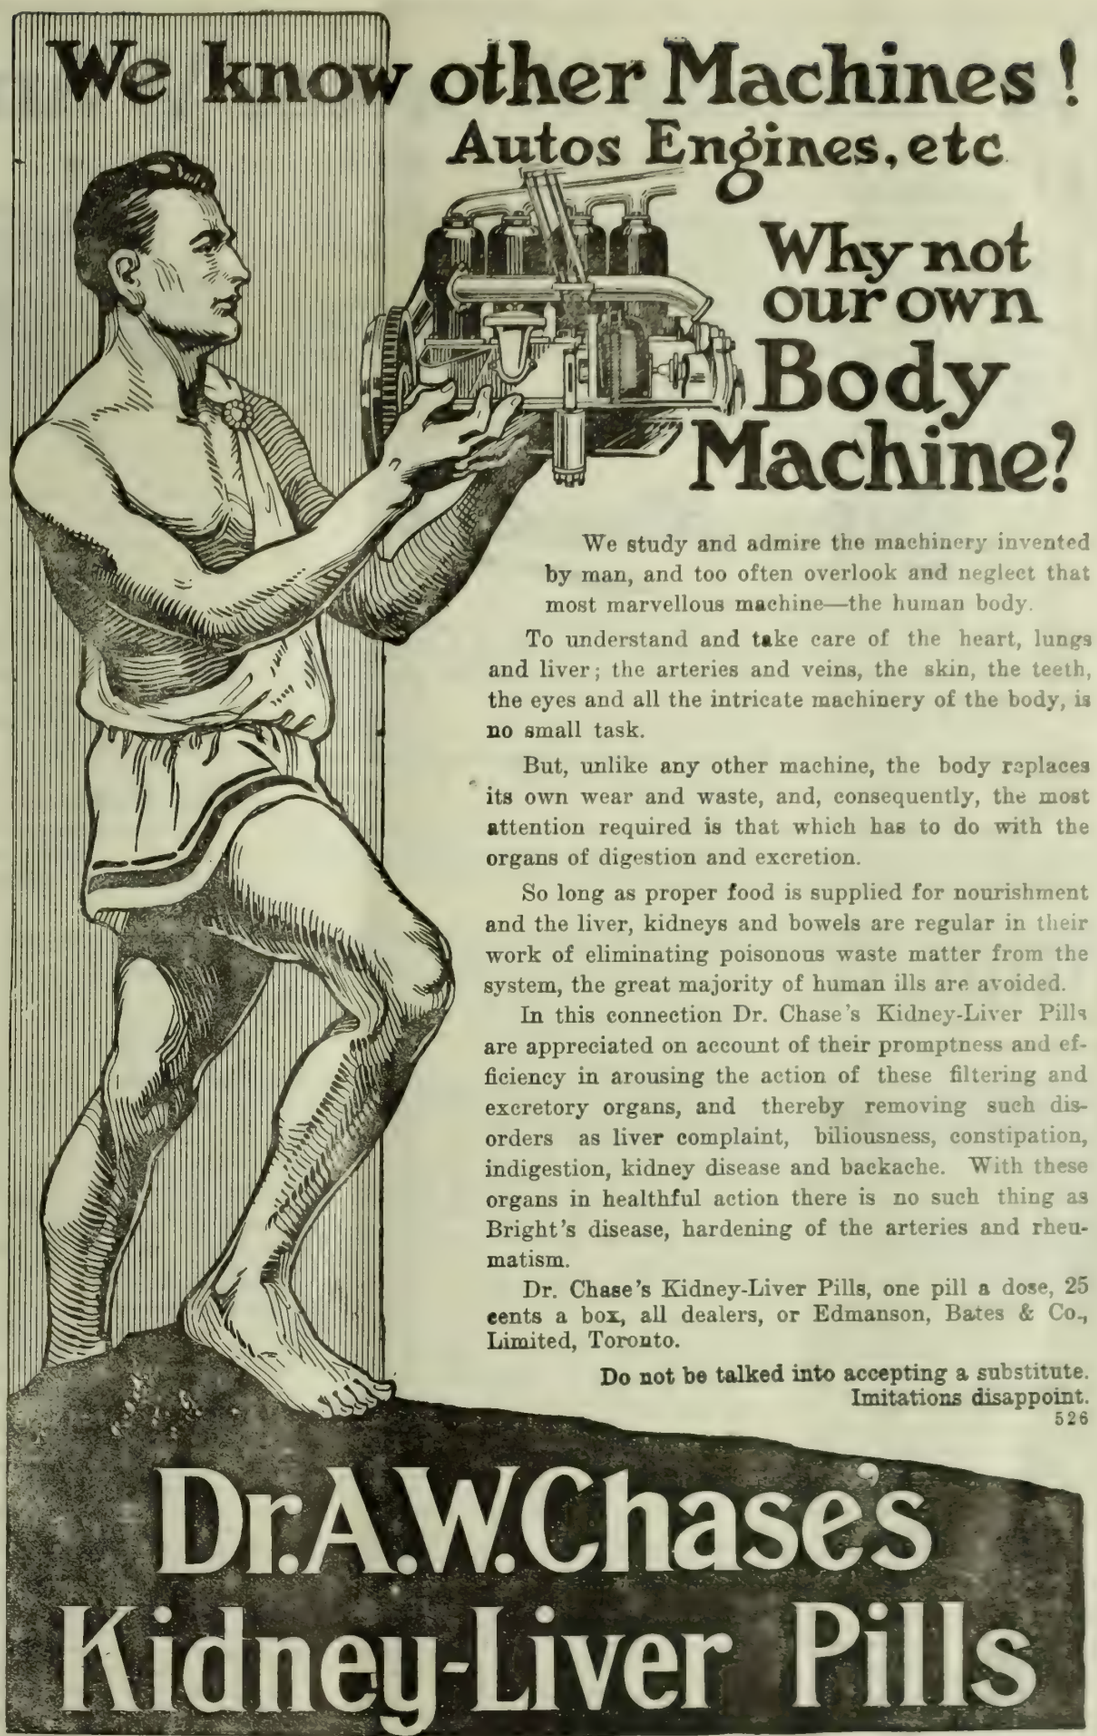
We are inclined to believe that for the beginner the best time to start beekeeping is in the spring. However, this depends somewhat on circumstances, bees are always much cheaper in the fall of the year. If you have a suitable place to winter them, it would therefore, be just as well to buy in the fall.

In this province, bees are wintered most commonly in the dwelling-house cellar. Any cellar that will keep vegetables will do for a few colonies of bees. The cellar should however, not be damp or mouldy. If the colony is made up of young bees and there is a plentiful supply of good stores, the chances of their coming thru the winter, under most any ordinary cellar conditions, are pretty good.

We have no bees for sale but readily can, and would be very glad to put you in touch with those who have. Bees may be bought in boxes, for from $2 to $4 per colony. In movable frame hives (and be sure the frames are movable) for $4.50 to $6.

In view of the fact that foulbrood, a highly contagious bee disease, is known to be prevalent in some parts of the province, we would strongly recommend that you first get in touch with us before having bees sent to you from any part of the province. Bees are so plentiful in the province that there is certainly no reason for taking a chance of bringing more disease in, by going outside the province to buy bees. If you cannot buy from your neighbor, the kind of bees you wish to keep, then take any kind you can get and later, change them to the kind you want by introducing queens of that breed. There is little danger of bringing in contagious diseases with queens if a few simple precautions are taken.

Very truly yours,
H. B. DUROST.



We know other Machines!
Autos Engines, etc
Why not our own Body Machine?
We study and admire the machinery invented by man, and too often overlook and neglect that most marvellous machine—the human body.
To understand and take care of the heart, lungs and liver; the arteries and veins, the skin, the teeth, the eyes and all the intricate machinery of the body, is no small task.
But, unlike any other machine, the body replaces its own wear and waste, and, consequently, the most attention required is that which has to do with the organs of digestion and excretion.
So long as proper food is supplied for nourishment and the liver, kidneys and bowels are regular in their work of eliminating poisonous waste matter from the system, the great majority of human ills are avoided.
In this connection Dr. Chase's Kidney-Liver Pills are appreciated on account of their promptness and efficiency in arousing the action of these filtering and excretory organs, and thereby removing such disorders as liver complaint, biliousness, constipation, indigestion, kidney disease and backache. With these organs in healthful action there is no such thing as Bright's disease, hardening of the arteries and rheumatism.
Dr. Chase's Kidney-Liver Pills, one pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.
Do not be talked into accepting a substitute. Imitations disappoint.

RED ROSE TEA "is good tea"

A Tireless Worker Wants a Job

HE will get up at 5 a. m. and work through till bed time without complaint.

Give him a sawing outfit and he will cut wood all day long. He just feels fine when he's driving the thresher, the grain elevator, straw cutter, fanning mill or hay press.

He seems to really smile when turning the sausage grinder, green bone cutter or grindstone. And then when his boss's wife wants the separator, churn or washing machine run he is happy to oblige her.

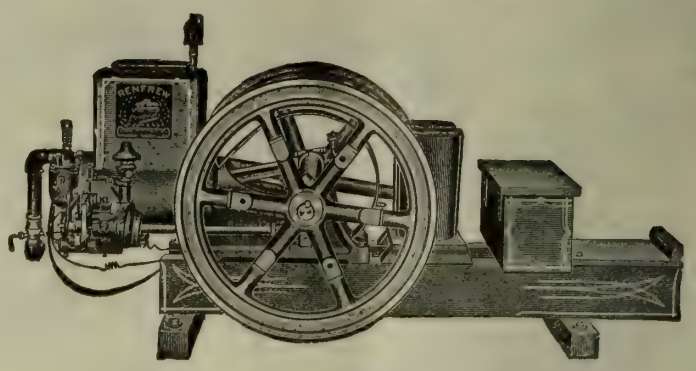
He doesn't eat much. Just feed him a little gasoline, and some oil to keep his working parts limbered up, and he's your faithful servant. His name is

Renfrew Standard

and some have nicknamed him the "Big Boy"—because the Renfrew Standard is built extra large and strong. The 6 h. p. Renfrew Standard, for example, being almost as large as the average 8 h. p. engine.

The "Big Boy" sure is a whale for work and a friend worth his weight in gold to the farmer whose son has gone to the war or who cannot get enough hired help—and that's most every farmer.

The "Big Boy" is right up to date, too. He has two complete and independent ignition systems—batteries and high tension magneto. He is thus doubly reliable.



He has an economical carburetor that saves gasoline. He has a fly ball governor just like his brother the steam engine. He starts without cranking—and stays at his job until you tell him to stop.

He can lift an awful burden of work off your shoulders. He can save you precious hours of time. He can come right up to you from Renfrew by first train after he knows you will give him a job.

If you would like to read his pedigree and know what sort of stuff he's made of before you take him on drop a card to

AGENCIES ALMOST EVERYWHERE IN CANADA.

DAIRYING.

IMPROVING FARM BUTTER

The adoption of more careful methods of handling milk and cream and improved practices in the making of farm butter will reduce rather than increase the trouble incident to home production of this food, say dairy specialists, and will result in a superior product which can be sold more easily and for a better price than the average farm butter. Last year about thirty million pounds of butter, much of which originated on the farm, was washed or renovated because it was of such poor quality that it could not be profitably offered on the regular butter markets.

Churn Cream Only.

Cream alone should be churned. It may be skimmed as soon as it rises or may be separated by a mechanical separator. The latter plan is the more efficient, and though requiring a considerable initial outlay often will be profitable. The cream should be set aside in a clean place by separate milkings. A temperature of 50 degrees F. or lower should be maintained until from 12 to 18 hours before churning time, when the various batches should be stirred together well and brought to a temperature of about 70 degrees F. by placing the container in a bucket of warm water. One of the first acts of the farm housewife who decides to adopt improved methods should be to purchase a dairy thermometer. Temperatures play an important part in the development of flavors in butter, and always should be determined with fair accuracy. After the cream is mixed it should be kept at approximately 70 degrees F. until just before churning time, when it should be reduced to about 58 degrees F. where this is possible (or to such temperature not above 65 degrees F. as to complete the operation of churning within 25 or 30 minutes).

Churning

The barrel type has been found by dairy specialists to be one of the most satisfactory churns. The dasher or plunger type requires a somewhat greater expenditure of labor. Earthenware churns are especially undesirable unless perfectly glazed, since if pores are exposed they absorb milk and cream which later decay. Churns with mechanical devices inside them are difficult to clean and sometimes injure the body of the butter.

The churn should be scalded preparatory to churning, but should be cooled with water before the cream is placed inside. The cream should be poured in through a coarse strainer. Every few minutes during the early part of the churning gas should be allowed to escape from the churn. If the temperature is right the churning should require about 25 or 30 minutes. The process is completed when the granules of butter are about the size of large wheat kernels. The buttermilk should then be drained off and the butter granules repeatedly washed with cold water while still in the churn. The washings should be continued until all milk is removed. Under no circumstances should working be depended on to remove surplus milk.

Working and Packing.

When the butter is free from all milk it should be taken from the churn with a paddle and placed on a worker. The hands should never touch the butter, both on account of sanitary reasons and because the body warmth may melt the fat. The working should be done carefully to avoid making the butter greasy. Before the butter is worked, fine salt should be added at the rate of about an ounce per pound of fat.

The butter should be prepared for market in a rectangular mold since when in this shape the product is more easily wrapped and handled and is more pleasing to customers. Regular parchment butter-wrapping paper should be used around the prints, as ordinary waxed paper tears easily and sticks to the butter. The placing of the wrapped prints in paste board boxes is a desirable final step, as it protects the package, gives it a better appearance, and permits the use of the maker's name or trade-mark as an advertisement.

After the butter making operations are completed the churn should be rinsed carefully with warm water. It should be scrubbed with hot water, cleansing powder and a fiber brush, and finally should be scalded and set in a clean, sunny place to drain and dry.

DENMARK'S RECORD IN DAIRYING WORK

Denmark claims to hold the world's record of intensive farming. After Germany had taken Schleswig-Holstein, Danish experts figured that their development must come from within, and they proceeded to develop the arid wastes of Jutland, which have now become tremendous producers of agricultural and dairy products. The Danes claim that they have solved most of Europe's intensive farming problems, and that much of German efficiency in this direction has been learned from them. The little kingdom is one of the greatest dairy producers of the world and its butter is exported to every part of the earth. It is found in Mexico, and even in the far-off islands of the Antipodes as well as in Patagonia. Its reputation in Europe, particularly in England, is unexcelled, while vast quantities have been shipped for years to all the countries of Europe. American business men have always admired the wonderful cow-feeding methods employed by the Danish farmers, who tether their cattle in rows in such a way that they can eat but a certain section of grass in a day. The next day they are moved forward in the meadows and it is worked out on such a minute basis that by the time the cows have reached the end of the

pasture the grass is again ready for grazing at the beginning.—The (London) Dairy.

ONE COW EQUALS ELEVEN STEERS

One good Holstein cow made more money for a certain Northwestern Iowa farmer than eleven fat steers during the past year. By producing twin calves her profit amounted to $141.20, while that of the steers only totaled $138.27. As all dairy cows do not give birth to twin calves every year, deducting $50, the price of the extra calf and her profit would still be $91.20 or more than equal to the profit of seven steers. The results were procured under ordinary Iowa farm conditions and serve as a good contrast as the profits to be obtained from the beef and dairy business.

Thirty-three head of feeders were bought on the Sioux City market March 10, 1914. They cost $6.50 per 100 lbs. and weighed 846 lbs. per head, totalling a sum of $1814.67. Freight to the farm plus dehorning made an additional expense of $21.60. They were fed 15 tons of alfalfa hay before going on grass which at $10 a ton amounted to $150. Pasture cost $5 a load or $165 for the bunch. When on feed they consumed 16 tons more of hay, worth $160, and 800 bushels of snapped and shelled corn at 60 cents amounting to $480. The salt consumed during this time cost $10.

The cattle were shipped and sold on the Sioux City market, November 10, 1914. The cost of marketing was $63.05 for freight, yardage, hay, commission, and insurance. With the interest on the money invested, which was $72.64, the total amount of expense was $2936.96. On the market they weighed 1228.78 lbs. each and brought $7.75 per hundred pounds. A gain of 3000 lbs. of beef at $7.00 per hundred lbs. added $210 to thi . This sum of $3352.62 minus the expense $2936.96 left a profit of $415.66 on the bunch, or $12.57 on each steer.

The charges against the cow for feed were estimated; the feed was not weighed each time so exact amounts cannot be given. She consumed approximately three tons of alfalfa and twenty bushels of corn, which at the price paid for the steers was equal to $42. Pasture cost $5, salt and other incidentals $3, or in all a total of $50 expense. She produced two calves which were sold for $50 each when weaned from skimmilk. Her milk record was 8000 lbs. which tested 3.8% butterfat and this at 30c per pound amounted to $91.20. This made her entire production equal to $191.20, which minus the cost, leaves $141.20 as profit. The hay fed in both cases was very poor stuff and would not have brought $10 per ton on the market.

As a result from these figures and from similar figures of past operations, this particular farm is running more and more to dairy business each year. Occasionally bunches of cattle are fed, but only when an extra supply of roughage is on hand.—H. J. Shoemaker, in Hoard's Dairyman.

PUT THE RECORD IN THE SHOW RING

The Prairie Farmer thinks that some plan should be adopted for judging dairy cattle in the show ring whereby the record of actual milk and butterfat performance say, for one year, should be included in the scale of judgment. Slowly the dissatisfaction of dairy farmers with this superficial show ring judgment is forcing the trend of things in that direction. Of course such inclusion would apply only to the aged cow class. But shouldn't the record be made a part of the judgment? The prime object of a cow's existence, especially for breeding purposes, is what she can do at the pail. No matter how highly bred or perfect she is in form if she is good for nothing as a performer, who wants her? We agree with the Prairie Farmer.

Skim-milk is one of the most valuable feeds that is available upon the farm and for that reason it is better to keep the milk and sell the butterfat, than to sell the whole-milk.

Oftentimes the degree of excellence which a cow may possess depends upon the man who takes care of her.

FOR HEADACHES, BILIOUSNESS CONSTIPATION,

INDIGESTION

Nearly all our minor ailments, and many of the serious ones, too, are traceable to some disorder of the stomach, liver, and bowels. If you wish to avoid the miseries of indigestion, acidity, heartburn, flatulence, headaches, constipation, and a host of other distressing ailments, you must see to it that your stomach, liver and bowels are equal to the work they have to do. It is a simple matter to take 30 drops of Mother Seigel's Syrup daily, after meals, yet thousands of former sufferers have banished indigestion, biliousness, constipation, and all their distressing consequences in just this simple way. Profit by their experience. As a digestive tonic and stomachic remedy, Mother Seigel's Syrup is unsurpassed.

Instant Relief for

Biliousness

and other Liver Troubles

The astonishing efficacy of Dr. Cassell's Instant Relief is due to its toning effect upon the liver and bowels. It gives strength to the organs and helps them back to health and natural action. In other words it enables the system to cure itself. Don't weaken your liver with purgative pills or morning salts, don't get the salts-taking habit; let Dr. Cassell's Instant Relief bring you natural and therefore lasting cure.

Dr. CHAS. F. FORSHAW, D.Sc., F.R.M.S., a well-known British Scientist, writes:—"Never take Salines or Purgatives for Constipation—to force Bowel action is to aggravate the trouble and create the Constipation habit. I recommend as a superior and convenient treatment Dr. Cassell's Instant Relief."

FINISHING LAMBS FOR THE BLOCK

On the Dominion Experimental Farms some interesting results have been obtained from a number of experiments in lamb feeding conducted during the last few years.

The large percentage of Canadian lambs are marketed in the fall direct from the pastures. All the lambs from the farmer's flock are usually lifted at the same time, which means that the well finished lambs of good weight must help to sell the light, thin lambs, which may be as well bred but, being late lambs or twin lambs, have not done as well as their flock mates. Well finished lambs of uniform weight invariably command a higher price than mixed lambs varying in size, weight and finish, hence it is always more profitable to hold the lighter lambs and sell only those of uniform weight and finish. Again, the selling of the most of our Canadian lambs during the fall months practically always causes a slump in price. Lambs not required for immediate consumption are held in cold storage to the profit of the wholesaler in view of the usual increase in price of from $1 to $3 per hundred pounds between the months of November and April.

When the farmer appreciates these two conditions the lamb trade will be revolutionized and the farmer will finish his work and reap full profits for food-stuffs consumed by and labour expended on his sheep. Many farmers with abundance of roughage can well afford to finish from one to three carloads of lambs during the winter months, thereby making top market prices on the farm produce and a good margin of profit in addition. Realizing the existence of such conditions all over the Dominion, a large amount of investigational work along these lines has been conducted on the Dominion Experimental Farms throughout Canada. Details of this work may be seen in the annual reports; however, a brief summary of the work to date may be timely.

AVERAGE PROFITS IN WINTER LAMB FEEDING.

Experimental Farm at	No. of years	Weight of lambs when pu in feed lots	Buying price per cwt	Selling price per cwt	Spread between buying and selling prices	Profit over feed per lamb

*Most of the lambs at this Station finished on pasture.

Profits in Winter Feeding Lambs.

In the six years' work conducted on the Experimental Farms system, the profits on the winter finishing of lambs have ranged from 25 cents per head to $2.10 per head over the cost of feed. In other words, the Experimental Farms and Stations have purchased unfinished lambs on the open market or from drovers, and, after charging good prices for marketable farm feeds and cost prices for other roughages, have made from 3 to 33 per cent on the investment in the lambs, labour not included. Even allowing a fair margin for labour, this is as profitable a line of feeding work as can be carried on and shows a return on investment greater than is usual in the finishing of steers or shoats.

The class of lamb to buy depends largely on the lambs available and market requirements. Usually, the well-bred lamb showing plenty of constitution and thrift and weighing from 60 to 80 pounds is the best stocker lamb to put into winter quarters. Lambs weighing from 80 to 100 pounds, if thin, may be profitably put in the feed lot for a short finish and if good fall pastures are available this may be as profitable a line of work as any. The finished, heavy

BARN FIRES IN THE PROVINCE SERIOUS

From Toronto World October 5 Page 6

Damage in Last Two Months Totals Three Hundred Thousand Dollars.

TO CALL CONFERENCE

Will Discuss Cause and Prevention—Legislation is Suggested.

Barn fires to the number of 121 have been reported to Fire Marshal Heaton for the months of August and September of this year. The cost to the province is about $300,000, of which 60 per cent. has been assumed by fire insurance companies and the remainder, $120,000, on which there was no insurance, has been a dead loss to the farmers.

"I know that I am erring on the conservative side," said Mr. Heaton when he made the above statements yesterday. Returns for September are not complete. There is no evidence of the incendiarism suspected at one time when German interference was hinted.

Mr. Heaton plans to call a conference soon of those most nearly [illegible] to go into the cause

Practically all of which could have been prevented through the use of Pedlar's Metal Coverings

KNOWING how much depends on the safety of *your* crops, *your* cattle, *your* implements this year and for years to come, why continue to imperil each season's hard earnings by putting up with a barn whose roof and walls are a constant invitation to fire and lightning and flying sparks? Don't wait until legislation forces you to erect safer buildings. Re-cover your barn *now* with Pedlar's "George" Shingles and Pedlar's Corrugated Iron Siding. A slight expenditure now for protection would look small against the loss of your barn and its contents. And Pedlar's Shingles and Siding insure you absolute protection against fire, lightning and weather for generations.

lamb weighing from 80 to 110 pounds should never be purchased for feeding purposes. The time when greatest profits can be made in purchasing lambs is usually between the months of August and November. However, the condition of the pastures and of the lambs themselves as well as the markets, will regulate the time for purchase. The proper time to sell the lambs is when they are finished, whether this be November or April or any intervening month. This applies also to the selling of lambs off grass. Finished lambs will make small gains at a very high cost per pound, which cost will usually be far in excess of the market price at that season. In addition to this, the markets are demanding a well-finished lamb, not overdone, and ranging from 85 to 105 pounds live weight, depending upon the breed and season of the year. This, of course, does not apply to the young lamb trade of the spring and early summer. The accompanying table shows the average profits over the cost of feed in the feeding of lambs on the Experimental Farms throughout Canada during the past six years:—

This table shows an average profit over feed—on Experimental Farms and Stations throughout Canada, in the feeding of many carloads of lambs —of $1.05 per lamb when the spread between buying and selling prices is approximately $1.70. Since the spread between buying and selling prices has exceeded this amount during the past two years and promises a still further rise during the next two years, one is safe in anticipating a reasonable profit in lamb finishing, in spite of the very high price of lamb at the present time. If this applies to the purchasing of stocker lambs for winter feeding, it would apply doubly to the farmer or shepherd having lambs in an unfinished condition. It is always profitable to finish lambs before putting them on the market.

Feeds for Winter Lamb Finishing.

A large number of feeds have been tried in this work and these may be briefly treated under the four headings; dry roughages, succulent roughages, grains, and mill feeds.

Of the dry roughages, alfalfa hay is an easy leader, closely followed, however, by fine clover hays and fine mixed hays. At the Experimental Station, Lethbridge, Alta., it has been found that alfalfa hay, when properly fed with succulent roughages and grain, is worth $21 per ton for the finishing of lambs. It has also been found that alfalfa hay alone or with meal is less profitable than when succulent roughages, such as roots (turnips and mangels) or green oat sheaves, are also fed. What applies to the rich alfalfa hay also holds true with clover hays. Good quality clover hay is worth from 10 to 50 per cent more in lamb feeding than timothy or similar grass hays. Proving the value of succulent roughages, it was found also that good quality timothy hay plus mangels gave from 15 to 20 per cent more profitable gains than clover hay alone. A hay made from peas and oats, well cured, will produce satisfactory gains, but at least 10 per cent less profitable than alfalfa or clover or a mixture of these with oat sheaves.

Fine corn stover will also make profitable gains, but there is a large percentage of waste. However, a small amount may be fed satisfactorily as a supplement to good quality leguminous or grass hay. Coarse hays commonly found in marsh lands are approximately 50 per cent less valuable in lamb finishing than good quality timothy hay and approximately 60 to 75 per cent less efficient than clover or alfalfa hay. A limited amount of straw may be fed satisfactorily in finishing lambs, but this

Real Home Made Pie—

Yes, Ma'am!
Real homemade Pie!

With top and under crust that truly melt in your mouth—and a generous filling of your own delicious homemade preserves or home-grown fruit.

That's a pie worth eating, and worthy of your baking, and it's the kind of pie you can make every time with

BEAVER FLOUR

MILLED OF BLENDED WHEAT

"Beaver" Flour equals any of the "special pastry flours" because it is, in itself, a special pastry flour—being the choicest Ontario fall wheat, blended with western spring wheat to give it strength.

This is why Pies, Cakes, Cookies, Tarts, Doughnuts, Buns and Fancy Pastry —when made with "Beaver" Flour—are so light, so flaky, so uniformly good.

This is also why the Bread and Rolls—made with "Beaver" Flour—have a delicate, nutlike flavour that is totally lacking in western spring wheat flours.

Just try "Beaver" Flour for anything you are baking—and see what happy results you get, every time.

DEALERS—write for prices on Feed, Coarse Grain and Cereals. 200

Take Good Care Of The Colts

It's cheaper to *raise colts* than to *buy horses*. But it's *costly* if you *lose* the colts. Keep a bottle of Kendall's Spavin Cure handy. For thirty-five years has proved it the safe, reliable remedy for spavin, splint, curb, ringbone, bony growths and lameness from many causes.

Kendall's Spavin Cure

is sold by druggists everywhere at $1 a bottle, 6 bottles for $5. Get a free copy of our book "A Treatise on the Horse" at your druggist's or write us. 116

Dr. B. J. KENDALL CO., Enosburg Falls, Vt.

THE HORSE

OILING THE HARNESS

The most important point in caring for harness is to keep the leather soft and pliable; this can be done only by keeping it well charged with oil and grease. All work harness should be thoroughly cleaned, washed and oiled twice a year. To do this, the harness should be taken apart and then all the plain leather straps should be thoroughly washed in warm water to which a little soda has been added. Scrub it well with a brush or a cloth to remove all dust, dirt and grease.

The leather should not be allowed to remain in the water any longer than is necessary or the stitching may be injured. Wash one strap and hang it up to dry and then take another. In this way, by the time the last straps are washed the first are ready to be oiled. Work each piece well with the hands until it becomes pliable. Patent and enamelled leather should not be put into the water at all, but it should be rubbed with a cloth moistened in warm water. After washing, the leather ought to be oiled while still soft and pliable, and before the drying is complete, so that the oil will strike in well. Lay out each strap on a board, and oil well with pure neat's-foot or cod liver oil.

The first is an excellent oil for harness, but cod liver oil has the advantage of keeping away rats and mice; they will never bother harness that has had a dressing of this oil. Take one strap at a time and give it a thorough treatment. A paint brush may be used to apply the first dressing of oil. Let the straps lie over night in a warm room and then go over them again. Work each strap through the hands this time in order to make it pliable. Now hang the harness up and allow it to drain and dry thoroughly before putting it together, also wipe all parts off with a cloth in order to remove the surplus oil which otherwise would catch dust and dirt.

If the harness needs blacking, now is the time to attend to this work while it is apart. Use vinegar black on the red spots and apply any standard make of harness black to the other parts. Or you can obtain the materials and make your own harness blacking, as follows: First dissolve together over a slow fire three ounces of turpentine and two ounces of white wax. Then add one ounce of ivory black and one dram of indigo, well pulverized, and stir until cold. Apply thin.

All broken and weak places in the harness should be mended at this time. Every farmer should have a simple repair outfit for harness, such as a leather punch, copper rivets and a sewing outfit. At any time when the harness begins ripping, take a few minutes and make the necessary repairs. This will often save a breakdown while at work, and it may eliminate the necessity of buying a new set of harness.

DRAFT HORSES PRODUCE BANK DRAFTS

This is the season of the year when the farmer with one or more brood mares must decide whether he will breed them to a pure-bred draft stallion of good type or to a grade horse. One requires a larger outlay for the service fee, but which one pays best? The question is well answered by the following story taken from Wisconsin Bankers' Bulletin No. 34:

A Wisconsin farmer one April day was leading his grade Belgian mare past a neighbor's place where a grade draft stallion was kept.

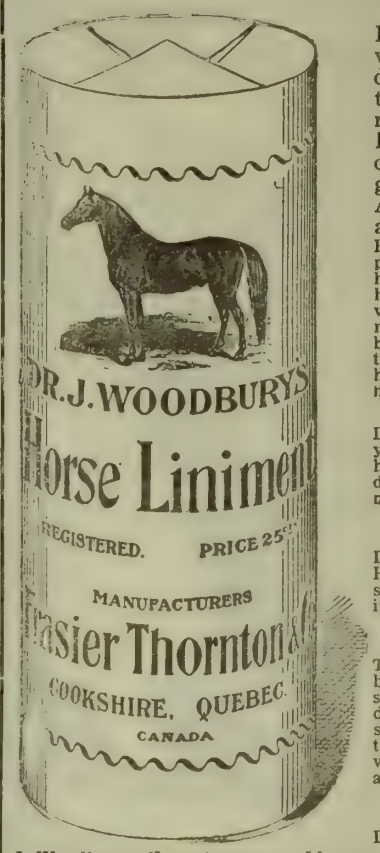
"Where are you going, Jim?" called the neighbor.

"I'm taking my mare to Mr. B's barn to breed her to his pure-bred Belgian," answered Jim.

"Huh;" said the neighbor, "why

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

don't you save time and money by breeding to my stallion? The fee is cheap—only $12.00. You'll have to pay $15."

"No, sir," said Jim. "The day I go seven miles from home to breed to a pure-bred sire I earn the biggest wages of the year."

Then the neighbor turned away and muttered: "Well, you can do as you please, of course; but I'm going to breed to my own grade horse."

Jim's mare in due time produced a fine foal. Mr. B came to see it at weaning time and liked it so much that he asked the price.

"Well," said Jim, "I'm not anxious to sell, but I'd take $125."

"Done." cried Mr. B. "Here it is," he added, pulling out his check book and fountain pen and quickly filling in the amount. "Deliver the colt at my barn the next time you come to town."

After Mr. B left, Jim stood thinking for a while, then walked over to his neighbor's place and finding him at home, asked:

"By the way, John, did your mare have a foal to your horse last season?"

"Sure " answered John, "and a dandy, too," he added.

"Want to sell?" asked Jim.

"Yes, if I get my price, and that's $50," replied John.

Jim smiled at that and asked:

"D'you remember me passing your place one day in April a year ago and you wanting me to breed to your horse?"

"Yes," answered John; "and did your mare get a foal " he asked.

"She certainly did," replied Jim, "and here's a check B gave me for the critter today. Pretty good wages for a day's work, eh? I made $72 by not using your horse and you could have done as well."—Hoards.

COLD FALL RAINS HURT COLTS

The exposure of young horses to the short spells of severe weather which occur frequently during the fall, causes a shrinkage in live weight and is a hindrance to rapid and economical development. Older horses seem to stand this sort of treatment with less loss. It is doubtless true that animals become accustomed to winter weather, but frequent changes from fine fall weather to bad storms retard gains in colts without shelter.

Four yearling Percheron fillies with an average weight of 1169 pounds pounds of corn and oats (one-half of each by weight, daily shrank an average of 32 pounds each during the spell of severe weather on Oct. 18 to 20 of this year, at the University of Missouri. Aged mares in foal lost only slightly during the same period.

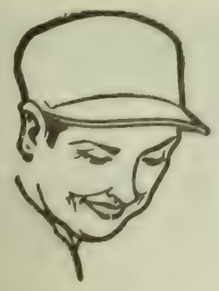
Inexpensive sheds, which will protect colts from wind, rain, sleet and snow, will prevent part of such loss in weight. Growing horses should not be housed too closely and prevented from taking plenty of exercise, but they should not be subjected to extremely bad weather if they are expected to make satisfactory growth.

IMPACTION COLIC

There are many different kinds of colic in the horse, and impaction colic is one of the most fatal. Impaction colic is caused by improperly masticated food, resulting from bad teeth. A horse is said to be as old as his eteth. Occasionally a 10-year-old horse is found with such bad teeth that he is already found to be a hard keeper.

The period of usefulness of a horse —and in many cases of his life— may be prolonged several years by proper attention to his teeth. The food that a horse eats is not cooked for him and his grinders must be in almost perfect condition, otherwise he becomes a hard keeper. The teeth should be given attention as often as once a year. It is poor economy to feed a horse all he will eat and still have him in poor condition and capable of giving only a mediocre service in return.

Don't forget to make your horse stalls as comfortable as possible for your horses. See that no cold drafts can enter under the floors, through broken windows or around badly fitted doors. Keep your horses well bedded. It will pay in their extra efficiency.



Cleans churns, hygienically —purifies every part and leaves no greasy film

POULTRY.

FRESH AIR, GOOD CARE

Now that cold weather has arrived, the chickens must receive more and more careful attention. Probably they have been running at large ever since the garden stuff was gathered, and if the place is large enough very likely they have been running all summer. Fine for them. Bnt now they must be confined and cared for or all the results you get will not amount to much. The early chicks ought to be well developed, fine birds and the pullets should have been laying for some little time. And with care they can be made to keep it up all winter. Birds that are not confined will take good care of themselves, and thrive, but when confined they have no such opportunity.

All too many fine birds are shut up in close but cold, damp, disease-breeding houses and are still expected to do their best. This they cannot possibly do. They must have fresh air, plenty of light and freedom from dampness or disease will get them sooner or later. Even if they are not really sick, they cannot thrive under such conditions. The only proper place for good birds in this or any other climate, except possibly the most severe, is the open front or semi-open front house, the open side preferably facing the south, the east being second choice, but under no circumstances facing the north or west. All other sides of the house should be absolutely tight, so that no draft is possible. The open side should be open nearly to the ground, so that the sun may penetrate every corner and crack. Have curtains that may be lowered on the coldest nights, and a protected roosting compartment is a good thing in very cold regions, but even this protection should be only sufficient to prevent the combs from frosting.

That's the kind of a house to have, but it isn't much good unless it is kept thoroughly clean and dry. It must be cleaned thoroughly every day to make conditions perfect, and the more days are skipped, the worst will be conditions and the less satisfactory the rtsults. Removable roosts and good roosting boards make the daily cleaning an easy task, but the proper spirit must be behind the worker or it will soon be neglected and often not done at all. Better not keep any hens than to keep them in this way. The litter as well as the roosting boards must be kept clean. Fresh litter should be put in the houses frequently, and the litter should be kept to a sufficient depth so that the birds will have to scratch for their food. It is essential that the nests and everything else about the place be kept clean, or mites and lice will be added to the poultry-house pests, all of which may be kept away with the application of intelligent care and a little labor.

But it is also necessary that the birds be properly fed, or the eggs will be few. There must be pure, fresh water within reach at all times, also a well-balanced dry mash before the birds whenever they choose to seek it, and always plenty of grit and shell for all. The grain feed must be well balanced, not too much corn or oats, and plenty of wheat, the proportions depending largely upon the location, breed of birds and quality of the grain. A little care in observation, and the experiences of others will soon teach one how best to prepare the grain ration; but one thing is important—when the birds are confined, they must have plenty of food and water. I do not believe in wet mashes, but believe in serving all food dry and allowing the birds to moisten it as they see fit. Grain may be warmed in cold weather, and the birds should also have some kind of green food every day.

Another thing, they should have a good clean dust bath at all times. With these conditions constantly maintained, there will be no scarcity of eggs, even though the breeding of the birds be but indifferent. Of course, breeding is important, but proper care is even more so. H. L. G.

A Book made from photos. Under the eye of the camera a housewife shows how to lighten work in the kitchen.

Lighter Day—the Coal Range with the Handy-height oven—is clearly shown in every operation. Use the coupon and get a free copy.

15

Here is help for those who prepare the big dinners on the farm.

Here is a range that does away with all the stooping, the constant bending over that makes baking days so wearisome.

The Lighter Day is a Coal Range with a Handy-height Oven.

The Oven has a Clearview door of glass. Once a dish is placed in the oven, you need not touch it until it is done.

There is no stooping to place it in the oven, and no stooping to watch it as it bakes.

And capacity! There is warming space almost treble that of other ranges. The Warming Closet above the oven is directly heated by the fire. It is an auxilliary oven. Under the oven is a Warm Storage, wide and deep. It will keep a huge dinner piping hot.

The Hot-water Reservoir has great capacity and heats very rapidly.

There are six pot-holes, four in the big roomy top, and two enclosed.

Many thousands of women are lightening their work with the Lighter Day. Over 700 dealers sell them. See one and you will delight in the many new features that save labor.

If you cannot see the range, let us show it to you in our booklet "A Lighter Day in the Kitchen." It is free if you use the coupon.

REMEDY FOR FALL COLDS

Fowls, like humans, frequently take slight colds, says Country Gentleman. If treated in time, these can be easily overcome and serious consequences avoided. The first signs of cold in a flock are usually slightly sticky nostrils, bubbles in the corners of the eyes, and perhaps sneezing. This is the opportune time to treat the trouble, before it develops into something more serious, such as roup.

The first thing to do is to find the cause and remove it. Then some remedy should be administered to help the fowls get rid of what cold they have. We have found the following, which can be filled by any druggist, excellent in treating flocks of poultry with slight colds:

Magnesium sulphate, 10 oz.; magnesium oxide, 1 oz.; sulphate of iron, 2 oz.; ground ginger, 2 oz.; flower of sulphur, 3 oz.; red pepper, ½ oz.

All the ingredients should be in the form of fine powder. We have always mixed this powder with moist mash, using a heaping tablespoonful to every 25 mature fowls.

We have found it best to use the remedy in the mash two or three days in succession and then skip a day or two and repeat. A week to 10 days of this treatment, combined with the removal of the cause, will usually overcome the trouble if treatment is begun early.

POULTRY

November.

Begin the month right by starting to keep accurate account of your receipts and expenditures. A simple way to keep track of the grain used is to have a supply bin in the poultry house. The grain can be easily weighed and the amount recorded each time the bin is filled.

The Stock.—By the beginning of this month, pullets should have been in their winter quarters several weeks and should be either laying or just about to begin. Give them regular attention; see that the hoppers are kept well supplied and that the water pans are kept filled. Be sure that the hens and pullets are in separate pens as it is impossible to do justice to both where they are running together.

Feeding.—The pullets should be fed heavily for egg production and the hens—the breeders—fed on a light ration. Feed the pullets mixed grain morning and evening. This should be buried in a deep litter to make them work for it. Keep a hopper filled with dry mash before them. The feeds used both for grain and mash feeding will depend on what are most available. Wheat, barley, oats, corn, buckwheat, are all excellent, but they are better mixed than any one feed alone. Bran, middlings or low grade flour and cornmeal, equal parts with half part blood-flour or beefscrap makes a good mash. If gluten meal can be had at a reasonable price half a part may also be added. Give them a regular supply of sour milk or keep a hopper of beefscrap where they can get what they want; also hoppers of grit and oystershell, and don't forget the green feed; mangels are one of the best and most convenient forms that can be used; a forkful of clover hay put in a rack where the fowl can have access to it will be appreciated.

The old hens should be fed sparingly and kept busy. Instead of the mash recommended for the pullets give them dry bran, or, if the mash is used, the hopper should be only opened for a limited time each day.

Market.—This is a good time to look up a market; eggs are scarce and retailers will be eager to get a regular supply.

Crate Feeding.—Continue crate-feeding. Do not try to dispose of all your surplus cockerels as soon as the cold weather comes. See that they are properly fleshed and if you are selling them dressed see that they are properly killed. Sticking, bleeding and then dry picking is the proper method. (See Exhibition Circular No. 70.)

December.

The work for December is largely a continuation of that of November. See that the houses are all ready for winter, that there are no draughts, and that the fences have been made ready for next spring's breeding. Winter is liable to set in anytime now, see that you are not caught unprepared.

This is the month that most of the turkeys and geese will be disposed of. Instead of depending on the wholesale market, get in touch with the consumer. When you put up your birds to feed, insert a small advertisement in a newspaper in your nearest city or town offering specially fed turkeys or geese for Christmas delivery. You can thus secure the retailers price and the consumer will get a first-class article in that it will have been properly fleshed and will be delivered unfrozen.

January and February.

During these months as much time as possible should be spent studying your flock, so that by the time mating season arrives you will have made up your mind exactly what birds you want and what birds you do not want to use for breeding. Of course, if you have reserved enough good breeding hens from your last season's pullets you will be all right, but if you find that you will require more hatching eggs than the hens you have will give you it will be necessary to select a pen of your best pullets.

If you have been fortunate enough to have used trap nests, you will know by this time what pullets will make the best laying records, as it is the early maturing birds that come out on top. If you have not used trap nests you should band the pullets as they begin to lay and keep track of them so that you can reserve the best for breeding next season. Let your breeding hens "rough it." Give them the run of the barnyard if possible; if not, keep the house wide open so that they will get all the fresh air and sunshine possible. Feed light, bury all the grain feeds in the litter, and see that they have all the green feed they will eat, so that they will come into the breeding season in the best possible condition.

Fresh killed, crate-fed stuff always brings high prices during these months. Your late cockerels should now be ready and capons will be eagerly snapped up at top notch prices.—GEO. ROBERTSON, Assistant Poultry Husbandman, Ottawa.

"I have a Neuralgic Headache."
Don't drug yourself, it is just nourishment your nerves need.
Dr. Cassell's Tablets Nourish your Nerves.
Neuralgia and Neuralgic Headache simply indicate that your nerves are weak and underfed. Why drug them into insensibility when it is nourishment they need? Drugs cannot supply that nourishment, they can only deaden the pain for a time at the cost of bad after-effects—heart-depression, faintness; and if persisted in a drug habit may be set up.
In Dr. Cassell's Tablets you have true nerve nutrients. The active principles in them are precisely what a specialist would prescribe in cases of Neuralgia, Neuritis, Neurasthenia, and other forms of nerve weakness. They nourish every nerve-centre in the body and give to the entire system, that strength and vitality which make nerve troubles impossible. Read what a Scientist says about Dr. Cassell's Tablets.
Dr. Chas. W. Botwood, D.Sc., Ph.D., etc., of York, England, says:—"As a safe and reliable remedy for loss of flesh and vigour, nerve affections and bodily weakness, Dr. Cassell's Tablets appear to be unique. I have no hesitation in recommending them."
Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, Anti-spasmodic, of proved therapeutic value in all run-down conditions, and the recognised remedy for
NERVOUSNESS, NERVOUS BREAKDOWN, NEURASTHENIA.
SLEEPLESSNESS, ANÆMIA. MALNUTRITION.
DYSPEPSIA, PALPITATION. KIDNEY WEAKNESS
Specially valuable to Nursing Mothers and Women of Middle Life.
Sold by Druggists and Storekeepers throughout Canada. Prices: One tube 50 cents. Six tubes for the price of five. War tax 2 cents per tube extra.
Sole Proprietors: Dr. Cassell's Co. Ltd., Manchester, England.

TESTING A BETHROTHED

"Alec, one of the most dangerous things in the world is to interfere in a love affair. I am not going to interfere exactly. That's not the right name for it, but I am your brother, and since you are going to take the matrimonial leap in the dark I venture to suggest a test to be applied to the girl you are about to marry."

"Mildred Huntington needs no test. She is perfect in every respect."

"Granted; but will not a proof of this add to your comfort? I will not deny that Mildred is perfect in every respect. She may be this and yet under certain circumstances think it advisable to marry some other person than you."

"What do you mean?"

"You know how hungry our American girls are for foreign titles."

"Some of them."

"Suppose Mildred should meet a British earl, a French duke, an Austrian or Italian prince, and he should propose to make her his wife, are you sure that she would stand by you?"

"Perfectly."

"Then there is nothing tobe said."

This dialogue occurred at a hotel in Maine. Alec and Fred Winston were members of a party that had been together there for several weeks, and the men were about to finish their outing by a hunt in the vicinity of Moosehead lake. Several of the girls were disgruntled at being deprived of what they considered the best part of the season's pleasures—camping in a wilderness—and demanded to be taken on the hunting trip. The men demurred, but so persistent were the women that they finally triumphed. More elaborate preparations were made, a chaperon was obtained, and instead of returning to civilization the party, consisting of five men and four women, started for the wilderness.

"Fred," said Alex the morning of their departure, "I wish you hadn't put that notion into my head."

"What notion?"

"About testing Mildred. I don't like to do it, but the temptation is becoming irresistible. I shall make the test as soon as we get home."

"You mean when you get where you will find a man to play the part of a titled aristocrat?"

"Yes."

When the party reached their camping ground and had settled themselves in their temporary canvas home. Fred Winston, who had made up the party, announced that they must have a guide and he was going out to find one. Setting out, he soon came upon a party of hunters who were about to leave the woods and asked if they had a guide who wished another job when they released him.

"There's a chance for you, Hawkesworth," said one of the party.

A man about thirty years old asked some questions about what was required and when informed said that he wouldn't mind taking the job. Having gathered his belongings, he bade goodby to his friends and started to camp with Winston. Hawkesworth was an Englishman, and Winston noticing his British accent conveived the idea of using him to make the test he had proposed to his brother upon Miss Huntington.

"How would you like," he said to the guide, "to play the part of a nobleman?"

Hawkesworth looked up at him, but made no reply. Winston gradually unfolded his scheme. Hawkesworth listened to what he said without comment till he had concluded, then said that he would not pass himself off for anything more than what he was, but he had no objection to Winston declaring that he was a prince of the blood if he liked.

"That's all I wish," said the latter.

When they reached camp Winston introduced the guide in this wise: "Permit me to present my friend Hawkesworth of London. He has the mania for hunting common among English bloods and is in the Maine woods for moose. He has consented at my invitation to honor us by joining our party, and, since he knows the best hunting grounds, will pilot us. We won't need any other guide."

Hawkesworth was made welcome, and when Fred Winston intimated that he was the Earl of Bingleton there was quite a flutter in the camp, especally among the women.

"He doesn't look like an earl at all," said one of the girls. "He's very ordinary."

"Why should an earl look different from any other man?" said his introducer. "Besides, how can style be expected from one who wears a flannel shirt? You can't judge a man by his clothes. They say that the worst dressed assembly in the world is the British House of Lords. They don't stand on their appearance. It's the fact that they are peers."

Whether Alex. Winston suspected that his brother had introduced Hawkesworth to make the test he had proposed, whether he believed the latter to be an earl, he kept his eye on his fiancee. All the girls of the party who regarded Hawkesworth with curiosity were desirous to know how they should address an earl, and were told that they might call him what they liked so long as they didn't call him anything above Tom Hawkesworth.

Hawkesworth, judged by certain attributes, was just the man a woman would admire. There was a natural air of dominating force about him. He was a silent man. It is the man who is always expressing opinions who does not get credit for depth, even if he has it. He who never talks is supposed to be always thinking. Great generals have usually been reticent men.

When the party was made up it was supposed that the women would remain in camp while the men went out to hunt, but they had not been in the woods long before it was proposed that the girls go out with the men to shoot moose. They were in camp costume, which favored the plan, and there were plenty of guns. So the four girls went with the men one morning on a hunting tramp, and it was understood that each girl should be assigned a protector. Fred Winston made the assignments and deputed Hawkesworth to be the guardian of Miss Huntington. On reaching a certain spring where numerous tracks indicated that animals came for water the party scattered, the several couples going in different directions for game, it being agreed that they should meet later at the spring.

As Hawkesworth and Miss Huntington took their departure the lady informed the guide that she wished to shoot a moose and for him to give way to her. He responded that there was no reason why she should not do so provided a moose gave them an opportunity. Intime, hearing a breaking of branches, he notified his charge to be ready to fire, and a little later when they stepped out into the open space a large buck moose was seen feeding a few hundred yards from them.

"Wait till he exposes his flank," said the guide.

He had scarcely spoken the words before the animal turned.

"Fire!" said the guide.

Miss Huntington fired, but instead of hitting the moose behind the foreshoulder she inflicted an irritating wound in a nonvital part. The animal, enraged, charged upon them.

Even a skillful hunter may wince at seeing a wild animal coming down on him to crush him. Miss Huntington's legs gave way under her, and she dropped on her knees. Hawkesworth dropped beside her, but on one knee instead of two, and leveled his rifle at the moose. Miss Huntington had no doubt that she would be trampled by the infuriated animal. There was a crack beside her and the moose dropped, plunging forward at the same time till his nose was within a dozen feet of them.

Then Miss Huntington completed her collapse by falling in a faint. When she came to herself she was in Hawkesworth's arms and he was looking down into her face with an expression that filled her with rapture.

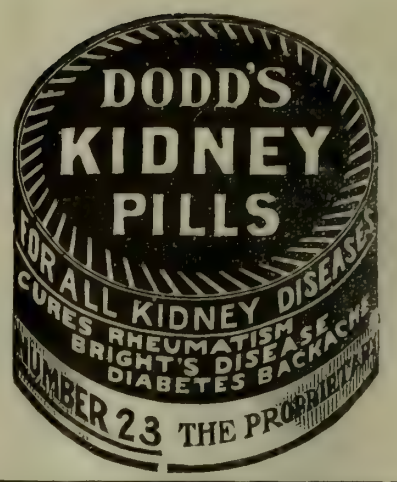
If she was to be won by an exhibition of the masterfulness of man there could be nothing more effective than what had taken place. When the two joined the others nothing was said about the adventure except that they had bagged a fine speciment of the inhabitants of the woods. But it was not long before Fred Winston told his brother that Mildred Huntington had fallen before the test to which she had been subjected. It was no news to Alec. He had seen immediately after the hunting party that he had been supplanted. But he did not know that his bethrothed's heart had been taken away from him by love instead of her desire for a title.

The party did not long hang together. Alec Winston and his fiancee were evidently at odds, and this threw a damper on the whole party. As soon as a sufficiency of game had been shot the tents were struck. When they took their departure Hawkesworth remained behind.

On the way Miss Huntington made it known to the other girls that her engagement to Alec Winston was broken. When asked the cause she replied that he had offered to release her and she had accepted the offer. Of course the announcement was made to the men by Alec, who sympathized with him, though the girls were not disposed to blame Mildred. In their hearts they felt that an earl was worth more than a commoner any day, and they were not sure but that they would have acted likewise under similar circumstances. It was supposed that the Earl of Bingleton was poverty stricken, but Miss Huntington was rich. The match, if she succeeded in capturing him, would be a good one.

That Miss Huntington had captured the prize became evident during the winter from the fact that cards were issued announcing the marriage of Mildred Huntington and Thomas Lawrence Hawkesworth. Then every one opened his eyes. What did it mean that the groom was announced on his wedding cards without his title? Surely a nobleman would not remain incognito.

Gradually the truth leaked out. Hawkesworth was not earl at all, and long before he proposed to Miss Huntington he disabused her mind of this false impression. He was the son of an English clergyman. Having a taste for woods and waters, he had spent much of his time in American forests,



A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry. palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. being enabled to do so by a small inheritance that gave him £500 a year.

And so it was that a desire to test his fiancee lost her to Alec Winston. He never quite forgave his brother for leading him to make the test, but Fred says:

"What's the difference, Alec? If she did not leave you for a title she left you for a man she liked better."

PRINCE EDWARD ISLAND WOMEN'S INSTITUTE

Marshfield Institute.—The regular meeting of the Marshfield Women's Institute was held at the home of the Secretary Miss Bessie Crosby, on Thursday, Sept. 7 at 2.30 P. M. Arrangements were made at this meeting to pack boxes of comforts to send to the boys of the community who are serving their King and Country in Europe. The members intend to again resume the work of knitting and sewing for the Red Cross Society. Miss Sterns gave a talk on the plans and arrangement of an efficient farm kitchen. Ideas were exchanged among the members after which the meeting closed with National Anthem.

Cornwall-York Institute.—The September meeting of the Cornwall York Institute was held on Sept. 4th at the home of Mrs. Enoch Drake. There were 21 members and 4 visitors present. At this meeting the members took up the subject of school improvement and all present showed their interest in this important phase of Institute work. Two members were appointed to visit the schools and a committee was appointed to report on the improvements necessary. Knitting for the soldiers is being resumed by the members. At the next meeting each member is to bring an Economy Hint.

Lakeview Institute.—The September meeting of the Lakeview Institute was held at Mrs. D. L. Morrow's on Sept. 6. The Institute held an ice-cream social recently at which fifty dollars was realized which goes towards the support of a prisoner of war. Miss Gordon was present and gave a demonstration in Millinery.

Kingsboro Institute.—Kingsboro Institute met for their September meeting at the home of Miss Gertie Stewart. There were 23 present. The Institute is making an autograph quilt for Patriotic purposes, and are resuming their knitting for the soldiers. They are also arranging to send scrap books to the soldiers in the hospitals, with the "news from home." Miss Gordon was present and gave a demonstration in Millinery.

Murray River Institute.—The Murray River Institute met on Friday, Sept. 1st. The regular business was discussed. Thirty-three dollars were raised with an autograph quilt and 7.50 was donated to the Institute for Patriotic work. The Institute is having a spinning bee on Sept. 20th. All the members expect to be present and the day will be spent in spinning, sewing and packing a box of socks to send to the front.

St. Peter's Day Institute held their monthly meeting on Sept. 8 at 8 P. M. Miss Gordon was present and gave a demonstration in Dry Cleaning and Removal of Stains.

Red Point Institute held the September meeting on 5th inst. 3.30 P. M. Miss Gordon was present and gave a demonstration in the making and covering of hats. Owing to the busy season the attendance was not as large as usual. The members intend to resume knitting for the soldiers.

Miscouche Institute held their regular meeting on Sept. 5th at 8 P. M. There were 20 members present. The regular business of the meeting was discussed after which Miss Macfarlane gave a demonstration in Dry Cleaning and Removal of Stains. At the next meeting one of the members will give a practical demonstration in the Canning of Chicken.

MONTREAL

Souris West Institute.—The regular meeting of the Souris West Institute was held on Sept. 8 at the home of Mrs. Hugh MacDonald. Paper on the Influence of Flowers by Mrs. Walter Simpson, Bayview, was read and much enjoyed by the members. Miss Gordon gave a talk on the "Canning of Fruits and Vegetables." The Institute is purchasing a map for the school.

Macdonald Institute.—The regular meeting of the Macdonald Institute was held on Sept. 13th, 2.30 P. M., at the Macdonald Consolidated School. There was a good attendance. General business was discussed, also ways and means of raising funds. Miss MacFarlane gave a practical demonstration in salad making.

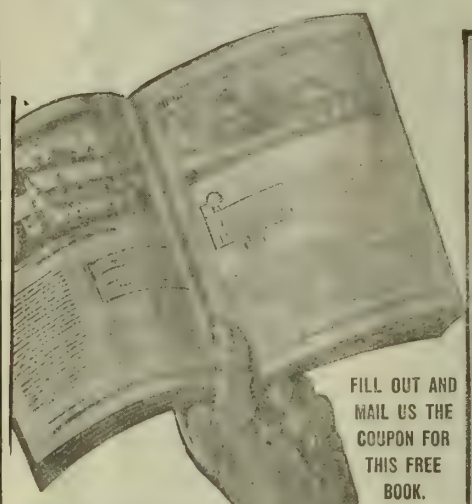
Montague Institute.—Montague Institute met on Sept. 8 for their regular meeting, which was held in their new Institute rooms. Miss Macfarlane was present and gave a demonstration in salad making. Upwards of 400 dollars was realized by the Institute serving dinner at the Park on the day of the annual races. This money is to be divided among the various Patriotic funds, including the Belgian Relief and the Y. M. C. A. fund for soldiers.

Georgetown Institute.—The Georgetown Institute held their regular meeting on Sept. 8 at 7.30 P. M. There were 27 members present. General business was first taken up, after which a talk and discussion followed on dyes and dyeing. Miss Macfarlane was present at the meeting. Salad making was taken up, and recipes were distributed among the members. The Institute has improved the primary room of their school, endeavoring to make it a model room.

Darnley Institute.—The regular meeting of the Darnley Women's In-

LOUDEN BARN EQUIPMENT

FOR QUALITY FOR SERVICE FOR SECURITY



FILL OUT AND MAIL US THE COUPON FOR THIS FREE BOOK.

Louden equipment makes possible a clean, sanitary barn with a minimum of expense for upkeep. When cows are transferred from dark, dirty barns to Louden barns, the milk flow often increases from 15 to 25 per cent. and the labour of caring for the herd is reduced from one-third to one-half.

The cost of of installing Louden equipment is surprisingly small, and is just as great an economy for the man with a half dozen animals as for a man with a hundred. The percentage of labour saved is the same.

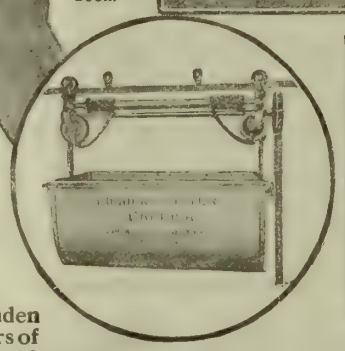
The Louden Line includes:

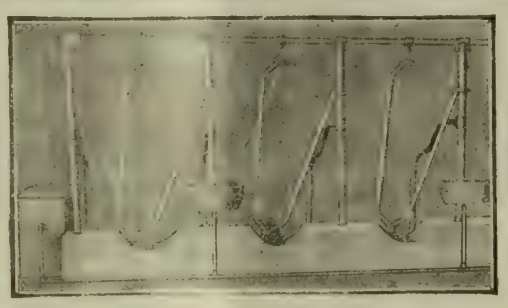
Litter Carriers, Hay Carriers,
Feed Carriers, Cow Stalls,
Horse Stalls, Water Basins,
Cow Pens, Bull Pens,
Hog Pens,
Barn Door Hangers.

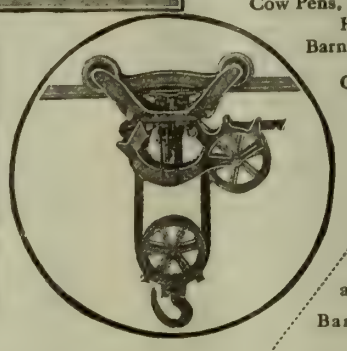
Catalogues Free

Book of Barn Plans Free

Louden "Barn Plans" is not a catalogue of barn equipment. It is a complete and valuable book of reference and instruction on barn construction. The 112 pages of Louden Barn plans is full of dollar saving information—the best of ideas gathered by the Louden Company during many years of barn building, and barn equipment experience. 51 representative designs for cow barns, horse barns, general purpose barns and hog houses. In addition, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.







Please send me copy of Louden Barn Plans. I expect to build (or remodel) barn for .....cows and..... horses.

Barn will be about x ft.

stitute was held in the school house Sept. 13th, 3.30 P. M. Miss Gordon was present and gave a talk on house furnishings. The Institute is planning to instal new desks in the school room, and a committee was appointed at this meeting to enquire into prices on same. An autograph quilt is being made by the members to increase their funds for Red Cross work.

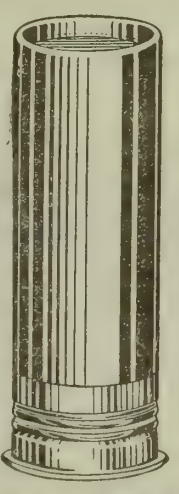
New Annan Institute.—The New Annan Institute met at Mrs. E. J. Wright's home for their regular meeting on Sept. 15. There was a good attendance. The members are busy knitting for the soldiers at the front, and they plan to send in the near future boxes of supplies to the boys of their community who have enlisted. Miss Gordon was present and gave a demonstration in the making and serving of salads. Next meeting will be held at the home of Mrs. William Morse on Oct. 22nd.

Meadowbank Institute.—The regular meeting of the Meadowbank Women's Institute was held on Sept. 20th, 3 P. M. in the schoolhouse, with a good attendance. The roll call was responded to by a quotation from well known poets. The regular business of the meeting was transacted after which Miss Gordon gave a demonstration in "Flower making." At the November meeting of the Institute the school children will be present and will give a demonstration in Physical Drill.

Harrington-Winsloe Institute.—The regular meeting of the Alexandra Institute was held on Sept. 18, 3 P. M., at the home of the Secretary, Miss Rebecca Stewart. After the regular business of the Institute had been taken up, Miss Gordon gave a demonstration in stencilling. The Institute has been very active in Red Cross work, and all the members do their share in knitting for the soldiers. The next meeting will be held at Mrs. Cephas Nunn's when a demonstration in salads will be given by the Supervisor.

Mapleleaf Institute.—The Mapleleaf Institute held their regular meeting on Sept. 21st, 2.30 P. M., at Mrs. A. J. Linkletter's, Sherbrooke. There were 35 members present. The regular business was taken up, after which Miss Gordon gave a demonstration in dry cleaning. The Secretary of the Institute sends reports of the Institute meetings to the members who are unable to be present at the

Ammunition Reliability



When you face an emergency in big game hunting—When the ducks, partridge or rabbits are making a quick "get-a-way"—When the "clay pigeons" dodge at unexpected angles or when shooting on the target ranges, dependable ammunition is absolutely necessary.

Dominion Ammunition

in your shotgun or rifle gives a feeling of confidence that makes satisfactory results certain. Sportsmen who *know* select it for its speed, accuracy and penetration. The big "D" trade mark is your guarantee of the best Ammunition that money can buy.

meeting. This is appreciated very much by the members as they can keep in touch with the Institute activities. Hospital shirts to be made up were distributed to the members, who are also doing a great deal of knitting.

Springfield Institute.—The regular meeting of the Springfield Women's Institute was held at the home of Mrs. B. Haslam, Sept. 22nd at 7.30 P. M. Miss MacFarlane was present and gave a demonstration in "candy making." There were upwards of 45 present at this meeting. The Institute is continuing knitting for the soldiers.

New London Institute The New London Institute met for their regular meeting at the home of Mrs. David Coles on Sept. 20, 2.30 P. M. All the members were present and several visitors. Miss Macfarlane gave a talk on "pickling". During the afternoon all were busy knitting socks, and the regular meeting was held in the evening. The Institute supports a prisoner of war, and in addition to the amount sent monthly, they are planning on supplying clothing to him, which they believe will be very acceptable. Plans were begun at this meeting to hold a social on Hallowe'en.

Stirling Institute.—The Stirling Institute met for their regular meeting on Sept. 21st in their Institute rooms. Miss Macfarlane was present and gave a demonstration in Stencilling, and a talk on Pickling, and recipes were distributed. All the members are busy at Red Cross work and a large amount of knitting is being done.

Success Institute.—The regular meeting of the Success Institute was held at Graham's Road Hall, Sept. 19, 7.30 P. M. Miss Macfarlane was present and gave a demonstration in Stencilling, and distributed recipes for Pickling. $5 was voted to the Belgian Relief Fund. $5 to be sent to Miss Plummer for soldiers Xmas Gift fun, $10 voted to purchase yarn for knitting.

Alpha Institute.—The monthly meeting of the Alpha Institute was held on Sept. 20th, 8 P. M., at the home of Mrs. George Crockett, York. There was a good attendance of members. The Institute meets weekly to knit and sew for the soldiers, and at their regular Institute meetings many of the members take their knitting. Miss Sterns was present and gave a demonstration in salad making, and printed recipes were distributed.

Malpeque Institute.—The regular meeting of the Malpeque Women's Institute was held Sept. 14th in Malpeque hall. There were 17 members present. Mrs. Sinclair McGougan was appointed president for the year. The Institute has funds on hand to be expended in renovating the interior of the hall. The members have arranged to have the school rooms cleaned regularly. Two papers were read and discussed by the members at this meeting.

Thanksgiving Institute.—The regular meeting of the Thanksgiving Institute was held on Sept. 12th at the home of Mrs. J. E. McNeil, Wellington. There were 18 members and 7 visitors present. The Institute has started an autograph quilt to raise funds for Patriotic purposes, and the supply of socks is about ready to send to 105th regiment. At the next meeting, which will be held Oct. 12, Miss Gordon will give a demonstration in Millinery and hints in a talk on Pickling.

Organization Meeting.—A meeting was held at Mt. Carmel on Sept. 22nd, and an Institute organized by Miss Sterns with a membership of 28. This Institute promises to be a successful one, and an invitation is extended to ladies of the vicinity to attend the meetings.

STOP YOUR FIRE LOSS
"METALLIC"
BUILDINGS ARE SAFE
WHY build with inflammable wood when you can get fireproof, weather-proof and lightning proof "Metallic" building materials. They are far cheaper in the end. "Empire" Corrugated Iron Siding is easily and quickly laid and makes a strong, rigid wall. Its light weight makes heavy construction unnecessary.
"Eastlake" Galvanized Shingles, coupled with "Heaven" Ventilators and "Acheson" Roof Lights make a perfect roof. "Metallic" building materials defy the elements. "Eastlake" roofs laid over thirty years ago are good today.
"Metallic built" means fireproof, storm-proof, permanent and durable construction.

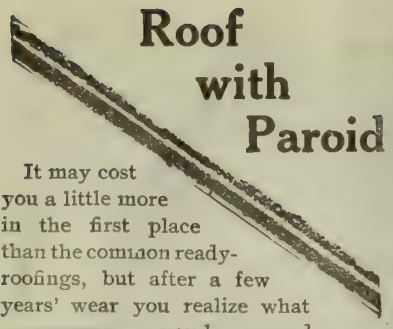
WHEN CHILDREN GET INJURED ACT PROMPTLY

The following article in "WHAT TO DO IN AN EMERGENCY" is from the pen of Maria Wheeler, formerly superintedent of the Babies' Hospital, New York City. If you have children in the home read it.

In families where there are young children emergencies are apt to arise whic h requires prompt action, as on this the child's life may depend. Think and act quickly. Be calm and keep your wits about you in the following situations:

Choking

When children are fed at irregular hours, or whenever they cry, they get the habit of putting small objects



Roof with Paroid

It may cost you a little more in the first place than the common ready-roofings, but after a few years' wear you realize what you have saved.

NEPONSET
Paroid ROOFING

Paroid has given real roofing satisfaction for the last 18 years.

Paroid is made of the Standard Weather Proofing and Fire Resisting Materials.

Paroid saves you money on repair bills each year.

Write for booklet "Repairing and Building"—FREE.

into their mouths. In case a child swallows a marble, a coin, a fruit pit, or a small trinket, give it solid food—a cereal, some bread or potato. The object will become imbeded in it and carried along through the intestines. Watch the stools for twenty-four hours to make sure that the article has been evacuated. Never give a cathartic. It will cause the contents of the intestines to become watery and to rush through the intestinal tract, leaving the object to lodge in some fold of the intestines, causing inflammation or an ulcer. Beware of safety pins. There is nothing so difficult to dislodge from a child's throat as an open safety pin. It usually requires a surgical operation.

The child's throat is small and a bit of food easily swallowed by an adult will choke it. Fatal accidents have been caused by giving a child a piece of meat to suck. When such a foreign body lodges in a small child's throat, the child should be turned upside down at once, grasping it by the feet. Several sharp raps between the shoulders should dislodge the food. An older child may be relieved simply by the blow between the shoulders. In case no relief is obtained, insert the thumb and forefinger or first middle finger in the child's throat and try to remove the obstacle. If the object is caught further down the passage, give the child three or four mouthfols of bread to swallow. This may carry the obstruction down with it. Children should be taught to eat slowly and to chew the food very fine after it has been cut in small pieces.

OLD-STANDING COUGHS
Cured by
Veno's Lightning Cough Cure.

Veno's Lightning Cough Cure is just as quick to relieve the coughs and bronchial troubles of the old, as it is those of the young. Veno's cures at all ages, and its wonderfully soothing and healing effect is never more strikingly shown than in the treatment of those old-standing coughs and wheezings, that asthmatic breathlessness from which so many old folks suffer. All coughs yield to Veno's Lightning Cough Cure. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

"CANADIANS AT YPRES."
(See Store Windows.)

12 Outer Covers from the 60 cent size of Veno's Lightning Cough Cure, or 24 from the 30 cent size, mailed to Harold F. Ritchie & Co., Ltd., 10, McCaul-street, Toronto, entitle you to a beautiful coloured reproduction of this famous Royal Academy painting. The reproduction is on view in most druggists' windows.

LADY'S HOUSE DRESS.

By Anabel Worthington.

A woman who keeps her house in order without the aid of a helper needs a dress of just such simple loveliness as the one in the illustration, so that she may be quite presentable to the unexpected caller.

This model is thoroughly up to date with a waist that is bloused quite full and, shaped with a tuck in each front turned toward the armhole, the effect is pretty. The left front, closing with button decoration to yoke depth, adds the necessary smartness. Although the neck finishes without a collar, the sleeves are cuffed with contrasting goods.

The seven gore skirt has a plait at each side front seam and an under box plait in the centre of the back, so that the same fulness that stamps an afternoon dress in the mode is featured in this serviceable garment.

It may be made of seersucker, linen, chambray or checked gingham. The ease with which the design can be reproduced will surprise and please you.

The dress pattern No. 8011 cuts in sizes 34-44. To make in size 36 requires 5⅜ yards 36 inch material with ⅜ yard contrasting goods.

MISSES' AND SMALL WOMEN'S DRESS.

By Anabel Worthington.

Individuality, simplicity and grace are perfectly expressed in this one-piece frock, designed especially for misses and small women.

Successful style treatment is shown with a panel, full length at back and front. The waist has the becoming open neck outlined with contrasting goods; the sleeves extending to neck edge give added interest to the model—they are cuffed neatly with a turn back of the same material that contributes the collar.

At normal waistline a belt fastening in front with a fancy buckle arranges the fulness and marks a skirt section that flares fascinatingly at the lower edge. While the combination idea is most effectively carried out, all one material may be employed with satisfactory result.

In the wool materials, serge, gabardine, striped and checked goods will be smart looking in this style. Navy blue serge with cream color broadcloth for collar and cuffs is another choice; all wool poplin trimmed with black satin is also suitable. Then if you really want to set yourself up, there is velveteen to develop this model in. There is almost no work at all to the making of it.

The dress pattern, No. 8,019, cuts in sizes 14 to 20 years. To make in size 16 requires 4 yards of 44 inch goods, with 1⅝ yards for front panel, collar and cuffs. In all one material 5 yards of 44 inch goods will do.

Sick Headache and Biliousness

CURED BY

MILBURN'S LAXA-LIVER PILLS.

Mrs. Willard Tower, Hillsboro, N.B., writes: "I have suffered something awful with sick headache. At times I would become bilious, and would have severe pains in my stomach after eating, and have a bad taste in my mouth every morning. I told some of my friends about it and I was advised to use Milburn's Laxa-Liver Pills. This I did and and they cured me."

When the liver becomes sluggish and inactive, the bowels become constipated, the tongue becomes coated, the stomach foul and sick and bilious headaches occur.

Milburn's Laxa-Liver Pills clean the foul coated tongue and stomach and banish the disagreeable headaches.

Milburn's Laxa-Liver Pills are 25c. per vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont

Foreign Bodies in the Ear and Nose

When children poke anything into the ear or nose, inflammation or a nasal discharge often results. Such a condition may easily be mistaken for a chronic cold. A dry pea or bean in the nose will swell and become embedded in the soft tissue, which makes its removal difficult. Ordinary small objects, such as shoe buttons, a wad of paper, or a fruit pit may be dislodged if the free nostril is firmly pressed with the finger and the child is told to blow its nose hard. Should this be unsuccessful, tickle the nose with a feather to bring on sneezing, or use a little snuff of pepper. A hard sneeze will accomplish wonders. If these methods fail, call in a doctor before serious inflammation sets in.

Foreign bodies in the ear are more difficult to remove. Should the object be an insect, a few drops of oil in the ear will usually float it out. Syringing the ear gently with warm water often dislodges the foreign body. Pull the ear outward and upward, placing the

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

Many Women Suffer From Pains in the Back.

When the back begins to ache it is a sure sign that there is something radically wrong with the kidneys.

What you want is a kidney medicine. Doan's Kidney Pills are not a cure-all, but a medicine for the kidneys only.

Mrs. L. Melanson, Plympton, N.S., writes: "I am sending you this testimonial, telling you what a wonderful cure Doan's Kidney Pills made for me. For years I had suffered so with my kidneys I could hardly do my housework. I used several kinds of pills, but none of them seemed to be doing me any good. At last I was advised to try a box of Doan's Kidney Pills. When I had taken the first box I found relief. I have used five boxes and to-day I feel like a new woman. I cannot recommend them too highly."

Doan's Kidney Pills bear the trade mark of a Maple Leaf and are put up in an oblong grey box. See that you get "Doan's" when you ask for them.

Price 50c. a box, 3 for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

When ordering direct specify "Doan's."

nozzle of the syringe at the upper part of the opening of the ear. Use a soft rubber syringe. A pea or bean cannot be removed in this way, for water will drive it further into the ear. When a child has poked any hard object into the ear send for a doctor.

No Crop Produces Profits Like a Maple Grove

Take any crop that you grow and figure out how much profit you have left after paying for ploughing, seed, fertilizing, cultivating, harvesting, labor, keep of horses, wear and tear on machinery, etc. Add to your cost a month of hot, dry weather and you are lucky to come out even.

Now go to your nearest neighbor who has a sugar bush with up-to-date equipment and ask him to tell you honestly how much syrup and sugar 100 average size maple trees will produce, how much he sells it for and what it costs to make it.

You will find that, acre for acre, a sugar bush will produce a bigger profit than any other crop that you grow—and with less cost for equipment, with less labor and in less time—besides the sugar season comes at a time of th year when no other work can be done.

Maple products are now higher in price than at any time in the history of the industry, let us show you how to produce the highest quality syrup and sugar and obtain the highest prices.

Ask us today to send you the fullest information about sugar making without cost to you.

Dept. 91 TORONTO, ONT.

Foreign Bodies in the Eye.

A cinder or a grain of sand will often become embedded in the eyeball if the eye is rubbed hard. The simplest way to remove the cinder is to pull the upper eyelid backward and downward, holding it there for a moment while the child blows its nose vigorously. Or let the child roll its eye from side to side and downward, when the object can be removed with the fold of a clean handkerchief. If the upper lid is pulled out and down over the lower lid and permitted to fly back quickly, sometimes the lower eyelash will sweep out the offending particle. If the irritation is obstinate, wash the eye out, using an eyecup filled with a solution of boric acid.

Plain warm water used with an eyecup is excellent. Wash the eye every half-hour. A scant teaspoonful of vinegar or lemon-juice to a cup of warm water makes an excellent wash when lime or boiling limewater gets into the eye. A weak solution of bicarbonate of soda will neutralize any acid in the eye. But irritation from this cause or any other should respond to these simple methods of home treatment within a reasonable time. When it does not, call in the doctor. The eye is too delicate an organ for one to take any chances with it.

Burns are caused by a dry heat or flame, scalds by hot water or steam. Both are painful and may be serious in their effects. A burn that simply scorches or blisters the skin need cause no special apprehension. The pain may be relieved by compresses of clean cotton cloth or linen, wrung out of a strong solution of bicarbonate of soda and water, or by cloths saturated with vaseline, olive oil or clean, sweet lard. Cover the dressing with a layer of cotton to exclude the air, as exposure to the air makes the injury more painful. If the skin should be blistered, do not puncture it to let out the water, for if the outer skin remains unbroken a new skin forms beneath it, thus preventing a raw surface. It is the extent of the surface involved which causes danger in case of a burn or scald. When burns are very extensive or very deep a doctor should be sent for as quickly as possible, or the patient should be taken to the nearest hospital. If the hands are burned, the fingers should be stretched apart and each finger bound up separately, otherwise they will grow together in less than 24 hours. It is well to remember that when the clothing catches fire, the flames mount rapidly to the highest point. Therefore, if one is standing, the fire soon reaches the head. If the clothing has caught fire, the person should be placed in a recumbent position on the floor or ground without delay and a blanket, rug or cloak should be thrown over him to smother the flames. The fire is soon extinguished if the flames have no chance to rise.

BRUISES AND CUTS

When a child has received a bad bruise from a fall or a blow, or if his fingers have been jammed in the door or window-sash, at once cover the bruised part with a compress of gauze or clean soft cotton cloth, wrung out of cold or hot water. Cold water reduces the swelling, hot water prevents discoloration of the parts. If the skin has been broken, wash the wound carefully, removing any dirt or unclean matter that may have been ground into it, then bind over the raw surface a square of clean cotton cloth, spread with boric acid ointment or vaseline.

Deep or incised wounds made by glass, a knife blade or a nail should be thoroughly cleansed by letting cold water from the faucet run into the wound; then wash with peroxide and bind on a pad of gauze, soaked as there may be bits of glass or other irritating matter in the wound. If the wound bleeds profusely, a pad of absorbent cotton should be held over the place for several minutes until the bleeding subsides.

In Case of Poisoning

Little children are mercifully guarded from many dangers. Considering that they cannot protect themselves by the use of the judgment exercised by an adult, it is wonderful that so many escape serious injury through accidents, etc. When a child has swallowed an active poison, or has been poisoned by foods improperly prepared, the important thing is to cause vomiting at once. This may be done by tickling the back of the throat with a feather and giving big draughts of greasy or soapy water or a glass of warm water in which has been dissolved a teaspoonful of mustard. See that the child is kept nauseated at frequent intervals to remove the poison. Then soothe the stomach with milk, white of egg beaten up, barley water or oil. The soapy water will neutralize poisons containing harmful acid, such as oxalic acid. In case of poisoning with caustic acid or potash, let the child have plenty of water containing vinegar or lemon juice. Every mother should know how to give "first aid" when accidents happen, for the saving of a life may often depend upon it.

THEY COST YOU NOTHING

FINISHING LAMBS FOR THE BLOCK

(Continued from page 93)

should only be as a supplement to clover hay and roots. Generally speaking, the richer the hay and the better it is cured, the more profits will be made in feeding it to lambs. Coarse dry roughages of any sort are less palatable, more wasteful and less profitable than are the finer feeds of the same varieties.

Succulent roughages play a very large part in profits from lamb finishing. Generally speaking, good succulent roughages, such as turnips, mangels, sugar beets, corn ensilage, pea and oat ensilage, or the like, make the dry roughages and grains more palatable and more digestible. Again these succulent roughages are cheaply grown and are rich, nutritious foods in themselves. Where corn ensilage may be raised for $2 per ton, it is the cheapest and best succulent roughage for lamb finishing. When fed with clover hay and grain it will produce 5 per cent greater profits than a mixture of turnips, clover hay, and grain. However, a mixture of turnips and ensilage with hay and grain will usually give greatest profits. The turnip is the safest root to feed in finishing lambs, particularly where wether or even ram lambs may be found in the pens. Mangels, particularly, may have a dangerous influence on the kidneys of wethers and rams.

The grains which may be most profitably fed vary considerably from year to year with the market values of those grains commonly found in Canada. Oats, barley, and feed wheat are all excellent grains for lamb finishing and may be fed whole or crushed but never fine ground. A mixture

of these three will usually give much better results than any one grain singly. Corn is anothr grain which excels in the fattening of lambs, particularly those requiring only a short finish. Corn-fed lambs on the Central Experimental Farm have reached a profit of $2 per head, making great gains at a reasonable cost. However, at the present market prices corn would not be profitable for this purpose. Elevator screenings also are very valuable in lamb finishing, varying in value, however, in direct proportion to the variation in the quality of the screenings. Where there is a high percentage of broken kernels of wheat and barley and oats, screenings may have a food value almost equal to a mixture of barley, oats, and wheat. Elevator screenings containing a high percentage of black-seeds and foreign matter have less feeding value. Screenings with dirt and black-seeds screened out give the greatest gains and profits. A mixture of whole screenings with barley and oats has given from 10 to 40 per cent greater profits than the screenings alone, the variation being due to the varying quality of the screenings. Black-seeds alone are most unpalatable and are dangerous to feed, in that a large proportion of the feed will pass through the lambs in an undigested condition and will again germinate on the land. Black-seeds fed alone are unprofitable and the lambs will make small gains if compelled to depend on this feed for their sustenance.

It is doubtful if, under average conditions, any high percentage of mill feeds can be fed profitably in lamb finishing. However, where grains are very expensive the following meals may be profitably used. Bran is an excellent addition to a grain mixture. especially in the absence or partial absence of succulent feeds. Linseed oil cake might often be profitably added to the grain ration to put a final finish on the lambs. Gluten meal is even superior to the linseed oil cake. Cottonseed when not exceeding 10 per cent of the ration may often be a profitable addition to the grain ration. Middlings, shorts, and fine ground grains are of a pasty nature when moist and should not be fed.

To briefly summarize the feeds, one might say that the character and quantities of feeds depend largely upon market conditions and feeds available. A ration including some good succulent roughage and properly balanced as to nutritive contents will almost invariably give greatest profits. Generally speaking, it will not pay to exceed one pound and a quarter of grain per lamb at the finish, nor will it be profitable to feed more than 5 pounds of succulent roughage and 3 to 5 pounds of dry roughage per head per day at any time during the finishing period.

Cost of Equipment.

The cost of equipment for the finishing of lambs is very light. Warm quarters are not necessary for sheep of any class. Sheltered sleeping quarters, free from draughts and having a dry floor, are usually all that is required. A good, tight, single-board shed with doors opening to the south or, for the prairie provinces, a straw shelter or even the protection of the bush or the straw stacks, would, under average conditions, be ample for this purpose. Cheap, convenient racks and troughs or a combination rack and trough will cost little per carload of lambs fed and, if made portable, may be used for both summer and winter feeding. No other class of stock requires so little in cost of equipment, in buildings, utensils, preparation of feeds, or in any other way as do sheep. In these days when labour is extremely scarce, this phase of animal husbandry should appeal strongly to the farmer who has not sufficient labour to go into dairy husbandry, swine, or even beef cattle.

PREPARE NOW FOR THE WINTER BY FIXING UP ABOUT THE FARM

The good brown earth that has yielded its golden harvest safely this year, into the hands of the patient husbandman, is covered over with Canada's "Beautiful," the winter snow, the soil's white, warm. protecting blanket and counterpane in these Northern lands. But before it comes to take possession of all the land, the farmers have somethings to do. The hay is in the barn and the grain is perhaps in the sack; the silos have been filled and the roots drawn to the root house. The harvest of the year has been garnered and much of the fall ploughing done, preparatory to the next year's operations. What else is there to be done? Much—much in a variety of little things, before farm homestead goes into winter quarters. Our Canadian winter is always best appreciated when full preparation and provision has been made for its coming. Even in the city well-ordered residences are made ready to go into winter quarters, much more should the farm house and the farm buildings.

The writer does not set himself up as an authority on all points to be observed, but he merely exercises the privilege of being in a position to re-

Hunger Stalks Through Belgium NOW!

While we in Canada are bringing in the harvests, filling our store-rooms and stocking our pantries with an abundance of good food—our Allies in overrun Belgium are facing another winter of near-starvation.

Women and children there by millions have gone for two years on short rations, for the Belgian Relief Fund has never been sufficient to provide full fare. Consequently they are in no condition to stand the still greater privations threatened on account of the growing number dependent on the Fund. Anything less than the present meagre allowance of bread and soup would, in thousands of cases, fail to hold bodies and souls together.

Shall we—can we—go on eating our three square meals a day—living well if not luxuriously—while Belgian children, pinched and cold, sobbingly beg their mothers for bread enough to stop the gnawing hunger?

$2.50 a month in the hands of the Belgian Relief Commission, will feed a Belgian family. A cigar less a day—a night missed from the theatre—simpler refreshments after an evening's cards—the price of any one of a dozen such habitual luxuries would provide the food that means life for a Belgian mother and her children till the end of the war.

Won't your own meals taste better when you know some little Belgians also are enjoying the food which you provide? Whatever you feel that you can spare, send your subscription weekly, monthly or in one lump sum to Local or Provincial Committees, or send Cheques payable to Treasurer

Carritte-Paterson Mfg. Co., Limited
Halifax, N. S. St. John, N. B. Sydney, N. S.

mind thousands of farmers of the necessity, economy and comfort to be derived from the making of adequate provision on the farm for the advent of winter. He merely desires to mention a few of the things that the farmer can and should do, in this direction. The danger is in putting them off too long and so rendering the doing of them doubly troublesome or altogether impossible. The snow is frequently proceded by cold rains, sleet and ice which make it extremely difficult to accomplish things that would have been easy, if done before the first ice and snow came.

It would, perhaps, for the purposes of advice, be well to begin with the house, because that is the shrine of the farm home life and the place where its glory should dwell, and the best part of that glory, during a Canadian winter, consists in warmth and comfort. To secure these it would be well for both the master and the mistress to look around betimes and have everything possible done. It would be well to have the double-windows put on and to see that they fit properly; also that the cellar is clean and sweet before it is banked and closed up. The stove wood should all be cut and split and stacked in the wood shed or other convenient place where the good housewife can easily get at it. The garden and lawns should not be neglected. The latter should be manured and the shrubs and plants that require winter protection should be duly covered with straw or coarse linen. If dealt with properly at this season they will come out all right in the spring. It would save impairing or destruction to have the gates to certain approaches to or exits from house or buildings, either firmly propped open or taken off the hinges and removed for the winter. Half open gates and rails embedded in snow look bad and can be mighty inconvenient.

A clean farm-yard is a good thing to have under the snow; otherwise it comes out as a perfect mud puddle or partial cess pool in the spring. Especially should the paths and approaches between the house and the barn be in good condition before the snow comes. And they should be kept firm and level during the winter.

Coming to the barn and buildings it would do well to see that the stable will be well ventilated without being draughty and warm without being close and stuffy. The ventilators and flues should be examined and put into perfect order if they are not found to be so. There is no reason why the windows of the barn and stable should be so dusty and dirty as they are generally found to be. Sunlight is one of the best atmosphere purifiers and clear bright windows will admit very much more of it than dusty or dirty ones; besides they look better clean than dirty. The doors to the barn, the stables and other buildings should swing well and easily and fit nicely, so that they won't constantly be getting blocked by hard snow and wrenched off their hinges by rough banging to close them.

But more money can be saved in the department of farm machinery and implements than in any other, by means of a little care at the right time. How often one sees ploughs, harrows, rakes, and even more complicated implements or machinery left out in the yard or even in the field to be at the mercy of the elements all winter. A little care at the right time would save a lot of trouble and expense the next spring. For this it is necessary to have a machine house, or sufficient accommodation in the barn at least for all the machinery and large implements. Before putting up such machinery, it should be cleaned and the parts oiled. Iron and wood work are both very assailable by wet and damp. Oil and varnish and paint are the great protectors against these corroding agents. A dry shed is another. It is well also when putting implements and machinery away for the winter to see that they are in perfect condition, that there is nothing lost or in a broken condition. Now would be a good time to have the loss or repairation made good, instead of in the spring when time is precious. No farmer can be too careful with his farm machinery.

THE PASSING OF A PROMINENT BREEDER

D. G. McKay, one of the foremost Guernsey Breeders in the Maritime Provinces and President of the Canadian Guernsey Breeders' Association since 1907, passed away at his home, Spruce Grove Farm, Scotsburn, N. S., on November 1st. Mr. McKay was well known to readers of the Maritime Farmers, who we are sure join with us in extending our and their sympathy to his bereaved wife and children.

Mr. McKay was straightforward, conscientious and hospitable. He will be missed in his home district, where his example was for advancement in all matters for the good of the community. He will also be missed by his fellow breeders and many friends in all parts of Canada.

His son, Alex. H., who was associated with him in Guernsy breeding, will continue the business under the old firm name, D. G. McKay & Son.

One of Mr. McKay's sons, is one of the officials of the Saskatchewan Department of Agriculture and another is with the Ontario Department of Agriculture.

Most of the farmers of Egmont Bay, P. E. I., took their lambs to Wellington on November 4th. The number shipped totalled approximately 550. One lamb brought $11.80 to its owner.

A small investment in money will add a whole lot to the comforts of the dairy stable. Why not see if you cannot make a better place for your cows and a better place for you to work?

"I earn $2 a day at home"

You may say that, too—if you want more income. Easy to learn. Steady work at home *the year round.* Write Auto-Knitter Hosiery (Canada) Co., Ltd. Dept. 306 F 257 College St., Toronto.

HALLAM'S GUARANTEED FUR COATS AND SETS

Write to-day for the 1916-17 edition of HALLAM'S FUR STYLE BOOK. 32 Pages illustrated, which shows beautiful stylish fur sets and fur coats moderately priced, and also gives full particulars of HALLAM'S ZOOLOGICAL CONTEST. 54 Prizes. $300.00 in CASH given away free. Address as follows:

CANADIAN PAINTS TO FOREIGN COUNTRIES

Further evidence of the fact that Canadian manufacturers are availing themselves of the present opportunity to strengthen their position in markets, is contained in an announcement made by Mr. George Henderson, President of Brandram-Henderson, Limited, at the company's annual sales convention which has just been concluded.

Mr. Henderson said that the company's export business has been greatly txpanded within the past year, and its Canadian-made white lead, paints and varnishes are now going in large quantities to South America, Russia, France, Cuba, and the West Indies. Further development of this export trade is being aggressively promoted, and the company's sales representatives are leaving this month to establish new connections in South America, Australia and China.

The convention also brought forth very satisfactory reports with regard to Canadian business, indicating that present prosperity is well distributed throughout Canada.

MILKING CLEAN AFTER CALVING

A subscriber says he has noticed in times past that some authorities have advised against milking a cow clean right after calving and he asks for reasons for such advice.

There are two main reasons: First, we have noticed in our fifty years of close observation that cows thrive better that were not milked out clean; they were less liable, we thought, to attacks of milk fever. Second, that is nature's way. No new-born calf was ever able to take all the milk his mother would secrete in the first few days after his birth.

And so from these two standpoints or facts we have deduced the judgment and formed the practice of not milking a cow dry right after calving.—Hoard's Dairyman.

USE DRUGS WITH CAUTION

A neighbor saw in a farm paper that blue ointment was good to kill lice on cattle. He tried it last spring and his cattle were soon taken sick. He called a veterinarian who pronounced it mercurial poisoning, but he saved four head and lost two which were worth $100, while the veterinarian's charge was $10. (John C. R. (Editor's Note —Blue ointment is poisonous, but when used in small quantities it is very effective for killing lice on stock, poultry, etc. A piece as big as a pea is enough to grease a fowl. If used too liberally it will cause poisoning as stated above.)

A Prince Edward farmer informed us some time ago that he had met with serious loss in his pure bred herd of dairy cattle by using Red Precipitate, Mercurie oxide, to kill lice. He used an excessive quantity of the powder, and not only killed the lice but also some of his valuable cows.

BARRENNESS

Please tell me what to do for a cow that is barren. She is not sick in any way only she will not bear.

W. J. K.

Inject into the vagina two or three times a week, until the cow comes in heat, a gallon of lukewarm water containing an ounce of pure phosphate of soda and when she is in heat balloon the vagina by injecting warm water, then slightly open the mouth of the womb by introducing a sound or probe and have the cow bred an hour afterward. Persist in the treatment if she does not conceive at the first service.

The only consolation for the creamery buttermaker is that his position is no different from that of other men in other lines who are doing equally responsible work. All have their troubles. None are so perfect they do not make mistakes, and none are so well informed that there is nothing about their business for them to learn.

Heavy loss in spring litters can be avoided by not having the sows farrow too early. If you have not first-class facilities to take care of March litters, then hold the mating until December 6, which will bring farrowing time April 1. The period of gestation in sows is 116 days.

Senator Yeo and Hon. John Richards held an auction sale ff young Shorthorn cattle recently at Summerside. Good prices were realized. Prof. Theodore Ross, North Bedique, also conducted a very successful sale.

Narrow doors are dangerous in the sheep barn, for sheep always want to go out at once when the door is opened. Rebuild the doors so as to make the openings 8 to 10 feet wide.

Preparedness for Now and After the War

THE KEY NOTE OF THE

SHORT COURSES

AT THE

College of Agriculture, Truro, N.S.

FREE to ALL students of the Maritime Provinces—

Farmers, Farmers' Sons, Wives and Daughters—

No age limit, from sixteen to over seventy. Equal Privileges for both sexes.

FROM

Jan. 2 to 11

YEAR 1917

Over 250 students attended last year. Additional attractions should bring more in 1917. The extra special attraction will be the series of lectures and demonstrations, during the first week, by Dr. C. A. Zavitz of Guelph, America's greatest crop expert.

MEN'S SHORT COURSE

Instruction in all branches of Animal and Field Husbandry, Farm Management, Veterinary Science and Allied Agricultural Sciences. The College staff will be assisted by leading experts from the Maritime Provinces and Ontario. Included will be representatives of the Dominion Dept. of Agriculture and the New Brunswick and P. E. Island Departments as well.

COURSE FOR WOMEN

Instruction and demonstrations in Dairying, Poultry Husbandry, Gardening and Domestic Science. Given in the beautiful and spacious class rooms for Women in the new Science Hall.

This course will be extended into a six weeks course if there is sufficient demand.

For particulars write to

Tuberculosis Rapidly Increasing Among Children of Belgium and Northern France.

More Food Urgently Needed to Keep up Their Strength

An interview with Mr. W. L. Honnold, American Director of the Belgian Relief Commission, brings to light a new danger threatening the population of the territory occupied by Germany.

Mr. Honnold reports that about 5,000,000 wholly or partially destitute people, who have been dependent on the Commission, generally show diminished vitality. The effects are most apparent among the older children, particularly those in the adolescent stage. Among these there is an alarming increase of tuberculosis, due to the lower power of resistance consequent on an inadequate diet.

To overcome this serious danger, the Commission appeals for extra contributions so that a special meal can be served every day in the schools. Efforts are also being made to provide as far as possible for children outside the schools

This can only be done—Belgium's children can only be saved—if every one of us who can possibly do so will give something toward the Fund. Whatever you can afford, send your subscription weekly, monthly or in one lump sum to Local or Provincial Committees, or

PIGS IN ORCHARD—LOGANBERRIES

A Digby County subscriber subits the following questions for reply in the columns of the Maritime Farmer. Replies by W. T. Macoun, Dominion Horticulturist:—

Q.—Can I successfully raise pigs, expecting them to cultivate trees and eat up the couch grass by the trees?

A.—While you should not depend on hogs for cultivating an orchard, it is true that they will work up the ground to a certain extent and in so doing make conditions better for the growth of the trees.

Q.—Will they injure trees if allowed one row of trees at a time fenced off

A.—While they do not usually injure trees if left free range in the orchard, if they were confined to a single row of trees, it is possible that they might do some harm. Therefore, it might possibly be necessary to drive in some strong stakes about each tree.

Q.—Will Loganberries grow in Nova Scotia and mature successfully?

A.—Loganberries would mature in the warmer parts of Nova Scotia providing the plants come through the winter safely. A good plan would be to lay the canes down so that they will be protected with snow. Where Loganberries are grown to the largest extent commercially namely, on the west coast of America, the winters are very mild.

Q.—Where can I obtain the bushes or scions.

A.—Loganberry bushes can be obtained from any of the larger nursery firms in the parts of the country where Loganberries succeed well.

W. T. MACOUN.

COOPERATIVE LAMB SELLING ON PRINCE EDWARD ISLAND

During late years a number of the farmers' Institutes of P. E. Island have adapted the selling of lambs as a unit instead of individually as was formarly the order. Excellent results have attended the new system of selling wherever it has been tried out, especially from a financial standpoint. As well there is the improvement in the care and breeding of the flock which results from the breeders being more closely associated.

An example of the value of Cooperative Selling is selected from the reports received by the Department of Agriculture in which the Rev. P. C. Gauthier, Secretary of Palmer Road Institute gives the following record for 1916. "All the lambs of the Institute weighing over 60 pounds live weight were sold for 8⅞ cts per pound. The total lot of 70 flocks averaged 90 pounds per head, while from these, 44 flocks averaged 95 pounds and 15 flocks averaged 100 pounds. The best average for any flock was 124 pounds which was gained by the only woman of the community who raises sheep. The best single lamb weighed 148 pounds and brought $13.14 at the selling price and the best fat sheep weighed 204 pounds and brought $12.24.

Of the factors responsible for such excellent returns the use of pure bred rams of mutton breeds stands preeminent. Last year the Institute purchased twelve pure bred Shropshire rams which were placed with members requesting them and at purchase price. In all cases there is a marked gain in weight over last years flock of lambs which runs from seven pounds in the lowest average to seventeen in the highest.

It may also be noted that no gain was noted where the system of breeding had not been altered from former years. Such an example as this speaks stronger than mere advice for the use of pure blood in many sections where it is still generally unknown.

CLOVER SEED HULLING

The Department of Agriculture is operating a clover seed huller. If a group of ten farmers have a reasonable quantity of clover containing seed, the Department will be pleased to send the machine to thresh the same. For particulars write,

Adequate Water Supply Always Within Reach For Profitable Stock Raising

At the time of writing this article, November 22nd, the ground is covered with six to eight inches of snow, the ponds are frozen over, although the mantle of snow has prevented the freezing of the ground to any great extent. Lumbering operations are being briskly carried on by the various operators. The hauling of timber and lumber is quite general, where hauls are short and roads fairly smooth, which is rather unusual so early in the season.

A few farmers were caught napping, or rather were overtaken by the early cold snap and as a consequence a portion of their turnip crop is still unharvested.

Young stock came in from pasture in good shape, they were not subjected to cold driving rains and sleet storms before being housed. Many farmers complain of a scarcity of water in their dug and driven wells and not a few of the smaller brooks are stone dry. This is particularly true in regard to portions of this County. It is something unusual at this season of the year when wells are usually brimming over to see farmers hauling water for their stock.

The mantle of snow, which is usually welcomed by our farmers, did not receive its wonted greeting this winter. Rain would have been preferred from the water supply standpoint.

The ground hardened considerably during the extremely dry weather experienced in August, September and October, so that when a rainstorm of fairly decent proportions swept over the country it did not penetrate the ground to any great extent, but ran off down the hillsides into the creeks and rivers and off to the sea, where its usefulness as a help to fill the depleted wells and water courses was lost for the time being.

This mantle of snow is however, conserving the moisture already in the soil and should the weatherman see fit to melt the snow before the real old fashioned winter weather season arrives, and should there be showers of rain, it will be found that the earth now moistened by the conserving powers of the snow will soak up the snow and rain water in good shape and act as reservoirs from which the wells will again replenish their wonted water supply.

The stockman requires an abundant water supply in order to bring his stock through the winter in good shape. An abundance of food without a sufficient supply of water for the requirements of the stock will not do the trick.

We believe all classes of live stock should have an abundant supply of clean water within reach at all time, and it pays the stockman well to make provision for the same.

The stockman who can rest comfortably when his cattle have not been watered oftener than once in twenty-four hours or more is not humane. Even where stock is turned out to water or when a trough in their stalls is filled twice a day, there may be cases of acute suffering from thirst in the herd. Particularly is this true on stormy days, if the stock has to drink in an unsheltered place.

We have often seen cattle on stormy days driven to the water trough, or brook, where holes had been cut in the ice, take just a sip of water, then scowl, shake their heads and put back to their stalls to endure the pangs of thirst until their owner saw fit to turn them out again. Even in cases where an animal takes a quite a large drink, considerable suffering may be endured unless there is access to water oftener than once or twice in twenty-four hours.

How often human beings take a long, cold drink of water and in a very short time require some more water to slack their thirst. How much they suffer if water is not available just then. Animals have their feelings in regard to food and water just the same as human beings have. The human being can make known his or her wants but the poor dumb brute usually must patiently endure until such a time as the herdsman makes his customary rounds. This is the condition existing in many cases where it is absolutely unnecessary and could be avoided.

Should an animal over gourge with ice cold water, after a period of suffering from thirst, the effect may be serious and a sick or dead animal may be the result.

Keep Ice from the Watering Trough

A recent issue of the Breeders' Gazette says anet the subject of keeping the watering trough free from ice:—

"Preparations for putting herds and flocks into winter quarters include a provision for taking the chill off stock water. Ice water is a luxury for the jaded palate of the human in hot weather, although the doctors warn against its use, or at least its abuse. Floating cakes of ice in the watering tank on a zero morning cost more than a water-tempering plant We learned long ago that the bovine is somewhat akin to the human in its taste for cool water. Warm water is not relished by cattle, but no one has ever seen a cow remonstrate at the presence of cakes of ice in the watering trough would imagine that ice water was acceptable in the winter. Tepid water, water with the chill taken off, best suits the taste and conserves the bodily heat. Some stables are so warm that the well water turned through the concrete feeding and watering trough or the iron troughs in front of the stanchions needs little or no tempering, although when held in storage tanks it is apt to stand near the freezing point when admitted through the pipes. Tank heaters are of value; these metal contrivances are set in out-of-door tanks, and a slow fire is maintained in them, the formation of ice being thus prevented. Better still, and more convenient, is a tank heater installed in the feed-room or boiler-room on farms which utilize such plants, or made to do double duty for house and barn where proximity of these buildings permits. The convenience of a constant supply of hot water on tap can scarcely be measured in the farm house. It is sometimes possible, now that such conveniences are bringing added comfort in the homes of farm people, to hitch on a pipe to the hot water tank and conduct it to the barn, if the run is not too great. Insulation is readily enough secured. This would give a supply of hot water to temper the drinking troughs of whatever nature, to mix the swill for the swine, to make the hot mashes for the poultry, and to wash the harness, the buggies and the autos. Plans for home building or remodeling or barn building should include a careful study of systems devised to keep the water on tap for the manifold uses to which it may comfortably and profitably be put on farms."

Advisability of Cow-Testing Work and Proper Care of Milk and Cream Clearly Demonstrated at the recent Halifax Exhibition

W. A. MacKay, Dairy Supt. for Nova Scotia at the right. Chas. Pippy, A Cow-Testing Official at the left.

Water Bowls—What the Cattle Think of Them.

We have read with much interest a folder issued by one of the manufacturers of Water Bowls, who are consistent advertisers in the columns of the Maritime Farmer. The major portion of the booklet is written from the cows' viewpoint, and we believe if cows were able to talk or write the sentiments, their expressions would coincide with those given in the booklet in question.

The opening paragraph is in the form of the following resolution:—

Whereas the undersigned used the — Waterbowls and find that they increase milk production, save many weary steps through the cold to a trough or spring, enable cattle to thrive better, look better, weigh more,

give richer, better milk, and save veterinary bills. We strongly recommend them to every farmer and will guarantee to make enough profit for the farmer, which will pay for the bowls in a very short time.

Signed Madam Holstein.
Lady Ayrshire.
Aberdeen Angus.
Squire Shorthorn.
Madam Jersey.
Butterfat Guernsey.
White Face Hereford.

"I Give More Milk."

Says Madame Holstein:

"I must have plenty of water to do my best. I must have that water constantly before me, so I can take a little sip of it whenever I want it. If I am neglected and allowed to go thirsty my milk production is sure to suffer, for milk is 80% water. I can't be expected to do my best in the winter months, if I am chased out into the cold twice a day to gulp down icy water from a freezing trough or spring."

"Put in Water Bowls, sir and in 3 months my milk yield will increase enough to pay for them."

A Prominent Holstein Breeder says:—

"My long experience breeding Holstein Friesian Cattle and I have had considerable success with them, proves that they can give the most milk only when they have plenty of fresh clean water constantly before them. Let them drink as much as they want to and as often as they like. It is out of the question to expect the best from any cow that has to be driven out to drink in all kinds of weather. Water Bowls in the stable are a paying investment.

"I Will Produce Cheaper"

Says Lady Ayrshire.

"I am nervous and sensitive. I cannot bear blows and cross words. Kind words and kind treatment are just like nourishment to me and I pay them back by giving more milk.

"What I cannot stand is being herded out on a biting winter morning or in a blizzard to gulp down a few hasty mouthfuls of water from the barnyard tank. The big bullies are sure to push in ahead and the rest stand and shiver until they are too cold to drink very much. Often, too, I have seen cattle slip on the ice around the trough and get permanent injuries from the fall.

"Then after I have been driven back to the stable, I shiver and shake until that icy water is warmed up to the temperature of my body.

"Of course I need exercise, but isn't it better to water in the barn with water bowls and just let out into the barnyard for exercise on mild, sunny days?

"I will appreciate this kindness and I will show my appreciation in the milk pail."

A Prominent Ayrshire Breeder says:—

"The Water Bowls are a decided success. I don't think I ever spent the same amount of money that gave me so much comfort and profit."

I'll Take First Prize.

Says Aberdeen Angus:

"I am Glencarnock Victor I, Grand Champion Steer at the Chicago International Fat Stock Show. I want to say that water bowls helped to put me there. My owner is J. D. McGregor, Brandon. Many western farmers think that steers are hardy and can stand ill treatment. So steers are exposed to wind and storm and forced to take icy water. But it don't pay. A steer would sooner go thirsty than gulp down gallons of freezing water. Many a beast is 100 pounds thinner than it should be—not because it hasn't enough to eat, but because it hasn't enough to drink.

"The dairy cattle get all the good things. They are kept in clean, well ventilated barns, where the temperature is comfortable. Many of them have their flanks washed and dried before they are milked. They are carefully milked, and above everything else, have all the water they want, right before them.

"My owner thinks that beef cattle dserve a little consideration too. Evidently he is right. Read what he says.

"The use of the Water Bowl Outfit in my stable by keeping water at an even temperature constantly before the animals has helped me in producing prize winning stock.

"It is much better to have the water before the animals in the stable than to have to drive them outside, particularly where we get so much cold weather in the winter as we do in this country. That is the reason that we went to the expense of putting a water system in and we use it altogether on our farms."

I'll Put on More Weight.

Says Squire Shorthorn:—

"It's my opinion that a farmer loses money when he waters beef stock at a trough. Driving us out in cold weather and breaking the ice for us to drink wastes our body heat and we have to eat more to bring it up again. Feed is the fuel that keeps cattle warm. So isn't it cheaper to water us in the barn where the warmth is not lost?

"Much of the feed we get in winter time is dry. It must be softened and the fibres wetted before it can be digested. This takes a lot of water. There is a limit to the amount of roughage, etc., we will take without plenty of water to quench our thirst. We can't take half what we need if we have to drink it from an icy trough.

"I like the water in the water bowls, because it isn't too cold and it is before us all the time."

A prominent Shorthorn breeder says:—

"Water Bowls are generally used for Dairy Stock, I know, but I believe they pay just as well for beef stock. I find I can fatten my animals with less work and expense, and I can put more weight on them than when they are watered in the trough or forced to drink from a tank in the yard; this is especially true in winter time when the cold weather makes the job of watering them by the old method a very disagreeable one. Moreover, I believe beef stock will respond to humane treatment just as well as the Dairy Cows."

I'll Give Better Milk

Says Madame Jersey:—

"Like other cows, I need plenty pure water to give the best milk. I must not be made to quench my thirst at some muddy stream or barn yard pool. Impure water is likely to give the milk a taste. Ropy milk is often due to contact with mud or muddy water.

"The water trough that some farmers have in their stables is the cause of impure milk and disease in the herd, for the cow at the end of the trough has to drink the slobber and leavings of the others.

"Water Bowls provide lots of fresh, clean water for the cows. They make the milk worth more money."

One of Canada's foremost Jersey Breeders' says:—

'In regard to Water Bowls, we regard them as an essential in a dairy barn. See that there is lots of water and see that it is pure. Otherwise, not even Jerseys can give their best milk. We would not want to be without our Bowls and wonder why any farmer would try to do without them, for they pay back all they cost."

Fewer Veterinary Bills

After a cow eats, digestion can't commence until the food in the stomach reaches a temperature of 80 or 90 degrees. When she takes a large quantity of cold water the stomach is chilled and digestion set back an hour. This often causes indigestion.

When cows drink from a trough a sick animal soon gives her disease to all the rest.

The pollution a cow will swallow if given freedom to drink from barn yard pools or muddy streams is enough to poison her. If cows are allowed to drink the contaminated water they stand in they are very likely to become infected with some disease. The infection often finds its way to the udder and often a quarter of the udder becomes diseased. The loss by reduction of the milk flow, the reduced value of the animal, the lowered value of her milk, and the veterinary bills would pay a large part of the cost of a water bowl outfit.

A prominent Veterinary Surgeon says:—

"Careless watering makes money for me."

As already stated, much of the foregoing is the sentiments of cows if they could so express themselves. They cannot speak in words, but they speak by their actions and it is well for every reader of the Maritime Farmer to make arrangements for an adequate watersupply for live stock, available at all times. It pays. You can have such a supply if you go after it properly.

Live Stock Husbandry Leads to Prosperity

Offsets the Evils of Land Mining

With every ton of grain sold, the farm loses $5.00 to $6.00 in fertility. With every ton of grain sold as meat animals the farm loses $1.00 to $1.20 in fertility. With every ton of grain sold as butter fat, the farm loses 20 cents in fertility.

Exclusive grain farming means:

1. Selling the farm by the wagon load.
2. Uncertain returns and, in the end crop failure.
3. More and more ditches and gullies.
4. Unsteady employment of men and reduced labor efficiency.
5. Sale of unfinished products and hence lower prices.
6. More tennant farmers.
7. More temporary agriculture, (unless soil is artifically fertilized or green manuring practiced).
8. Value of load of hay, $12.00 to $16.00. Value load of grain, $50.00.

Profitable meat production means:—

1. Keeping on the farm much of the fertility produced.
2. Crop insurance and increased returns.
3. Better use of untilled land.
4. Better help and better distribution of labor.
5. Manufacture of crops into meat.
6. More farms operated by owners.
7. More permanent agriculture.
8. Value of load of live stock $100.00 to $150.00.

Profitable Dairying means:—

1. Enriching the soil.
2. A regular income and a growing bank account.
3. Fewer gullies and land more tillable.
4. Steady employment of labor and better men.
5. Manufacture of high priced finished products, better prices, and higher returns.
6. Better business methods and, in the end land ownership.
7. More permanent agriculture.
8. Value of load of cream $150 to $200.

Many sections of the Maritime Provinces are admirably adapted to stock raising and dairying, and where ever one finds a district where either stock raising or dairying or a combination of both is followed, there one finds indications of prosperity on every hand.

A Typical Nova Scotia Creamery at Bridgewater, N. S.

Not long ago we chanced to be in a locality, where in former years the practice was to sell off the farm practically all the crops grown. Little was kept at home to feed live stock, and while the condition of the farm buildings showed that the district prospered at one time, the present indications show that the sons are not as prosperous as were the fathers.

On inquiring into the cause for the apparent decrease in prosperity, a gentleman closely in touch with the situation remarked:—"The farmers of this district in years gone by shipped their farms away from the wharf in schooner loads," the literal rendering of which as indicated in a previous paragraph, was that they had

followed the system of selling off the farms practically all the crops that they raised. They had realized ready money, prospered for a while to the detriment of future generations and while they built buildings substantial and commodious an asset for themselves and those that were to follow, they depleted the fertility of their farms to the extent that present generations, who aim to get into the more progressive systems of farming—live stock raising and dairying—are having a difficult task to bring the farms back to a good stage of fertility.

The present generation is surely succeeding and in doing so in some cases they have been obliged to go easy on appearances and devote their surplus funds to the righting of the wrongs that the land mining system of farming created.

Watch them, however, and you will find that those who are discarding the land mining system and devoting their energies to live stock raising or dairying, will emerge victorious. Instead of the gradual depletion of their fertility bank, they are adding to it, and wherever there is a continuous gain, be it ever so little, the road leads to prosperity. Small leaks and losses eventually lead to adversity.

Professor Cumming and others who read the signs of the times in Agriculture, have no hesitation in saying that "Live Stock is the back bone of Maritime Agriculture," and where dairying is the branch of live stock commonly followed, Winter dairying has come to stay.

It is true that in many sections of the Maritime Provinces most of the cows freshen in the spring. Many progressive dairymen, however, are breeding their cows to drop the calves in the fall. This is particularly true in regard to dairying in the vicinity of populous centres, where there is an opportunity to dispose of large quantities of milk at all seasons. They are doing this because they have found that winter dairying has many advantages, among which are the following:—

First, higher prices are obtained for milk and cream.

Second, labor on the farm is more equally distributed throughout the year. If the cows freshen in the spring they are in full flow of milk and need the best care during the time that work in the fields is most pressing. On the other hand, if the cows calve in the fall and are milked during the winter the farmer has more time to give close attention to the details of the work, and can also give his hired men employment the year round which will insure a better grade of help.

Third, the lactation period is lengthened and the amount of milk given during the year is very considerably increased. Cows that freshen in the spring milk heavily while grass is good, but the flow of milk falls off as the pasture dries up, and with the coming of cold weather they are nearly dry. If they freshen in the fall they can at once be started on a good winter ration, and when they have been milked six months it is time to put them on pasture, and for a time the flow of milk will be nearly as great as that from fresh cows. great as that from fresh cows. Recent investigations by experiment stations bear out this observation.

Fourth, fall calves are more desirable than those born in the spring. Young calves should be fed on milk for several months, after which time they must be weaned and fed on solid food. If the calves are born in the spring they will be tormented by the flies all summer, they may be neglected because of the farm work, and when it is time to wean them in the fall they must be put on a dry winter ration. Fall calves come at a time when the dairyman can give them the closest attntion and when weaned they can be put on grass at an age when an easily digested and nutritious food is most needed.

Since more milk can be produced, higher prices obtained, the labor more evenly distributed throughout the year, and better calves raised, winter dairying offers by far the best returns to producers.

More Sheep and Less Weeds

Editor Farmer:—

Some twenty years ago or about the time our Island Province took up co-operative dairying in earnest, almost every farmer kept a fair sized flock f sheep. In fact no farm was considered properly stocked without them. However, the prices for wool and lambs kept decreasing until it was evident that little profit could be made out of them and those who had gone more extensively into milch cows, sold their flocks. The others soon followed until a flock of sheep became almost a curiosity in many dairy sections.

The style of fencing changed to suit these changed conditions. The old rail fence that could easily be made to hold anything from a sheep to a mad bull, if it were built high and strong enough, was replaced by wire. Many farmers found that two or three strands of barbed wire would hold other kinds of farm stock, and where this could be purchased from 2½ to 3 cents a lb., the saving in cost of fencing, I believe, drove more sheep off the farms than sixteen cent wool or $1.50 lambs the pick of the flock.

As the sheepless years went by, many of these scantily fenced farms began to show other evidences that these industrious workers were no longer on the job of keeping weeds in check, and on large farms many of the old enemies and a lot of new ones, began to get a footing. The owners began to realize that they had acted hastily in doing away with such valuable helpers. Some farmers from time to time added a few sheep and our farm papers kept continually advising every farmer to "keep a few sheep." The latter phrase never appealed to me as I always considered it as hard to fence for a half dozen as a half hundred sheep. However, on securing another run down farm that was energetically producing about every weed known to botinasts, I decided to start another flock, even before the war had raised the price of wool to its present higher level. In the fall of 1915 I bought 14 lambs that weighed an average of 95 lbs., the following spring, 1916, sixteen ewes were added, thirteen of which produced nineteen lambs. The other three ewes either had their lambs and lost them before I purchased them, or were not in lamb. The lambs were born from the middle of May to about the 10th June, while their mothers were on a four acre field adjoining the barn. They were given no other feed or care, except taken into a large open shed when it rained. This field fed the flock of 30 until June 15th, the pasture was short but very thick, and the lambs grew fast. After this, I put them on an old weedy pasture that had not been broken for years, the natural grass then being out in head. This I was assured by experienced sheepmen, would be the ruin of the flock. The fields, however, were laid off in five acre blocks, and the sheep changed every fortnight regularly. I weaned the lambs the 1st of October and in about another month sold ten of them. We received 8¼ cents per pound live weight, and although twelve of the nineteen were twin lambs, they averaged nearly 100 pounds each, not a bad average for lambs under five months. I kept the best ewe lambs and four of the lightest, the ten sold brought me $81.26. The nineteen lambs at five months old and fed altogether on pasture, were worth $150.00. The wool from this flock sold for an average of $2.76. So if we count only the sheep that were in lamb, the flock averaged for lambs and wool $14.22. However, that is probably not a fair comparison, so we will count the total number and the average for the entire flock of sixteen sheep was $12.13½. Considering these sheep were purchased at auction in the month of May, for an average of $8.50 each, and were fed since that time nothing whatever but pasture, this looks like pretty good money. About as large profits and quick returns as some of our fox ranches were paying a few years ago.

These ewes and lambs were of no particular breeding. I know the sire of the lambs was a proper mongrel. They were fairly large sheep and their wool graded coarse. For next season I have fifteen yearlings and five ewe lambs in a flock of 34 ewes altogether, and have now a good pure bred yearling ram to head them. But I will not have the lambs come before the middle of May, although I do not profess to be a sheepman and have not kept them for twelve years. This was always our custom when we bred and raised sheep, and we had always good success with our lambs.

Our plan was to winter the sheep on hay and always try and have them go into winter quarters in good flesh. Hay alone is quite sufficient for sheep that do not lamb before the latter part of May. They will then be on grass long enough to get in good condition for lambing. Their fleeces will be much heavier than those of early lambing ewes. They will milk better and there will not be any trouble to speak of. The twin lambs especially will come on very much faster than the older ones, and you seldom lose one. In fact, last spring we did not lose one of the six pairs of twins and we gave them no assistance or attention further than keeping an eye on them that no trouble showed up.

However, sheep are fast coming into their own, and while this mongrel flock did well, it pays to head any flock with a good pure bred ram. I attended an auction sale recently where seven yearling ewes were sold for $35 a pair. They were "high grades" from a superior ram and they were certainly magnificent sheep, carrying as they did five dollar fleeces, they were well worth the price realized, and furnished further testimoney to the wisdom of using a real, good pure bred sire.

In this Province I think we were stampeded out of the industry through the anticipated cost of fencing more than by any other reason, as the dog nuisance is seldom mentioned here. But this should not prohibit sheep raising, as it does not require such very costly fencing to any who have a spruce or fir bush on the farm, long poles can easily be cut and wired on either a plain or barbed wire fence two such poles will generally make a fence sufficiently tight to hold them or a woven wire fence two feet high stretched around the field does not cost much, and can be easily shifted from field to field if necessary. I used both the above mentioned means of tightning plain and barbed wire fencing and found no trouble in stopping this flock, that had a reputation of going through most any sort of an enclosure before I bought them. Now while dairying has and will continue to be our main line of stock f rming, I have decided for our circumstances, sheep are here to stay. We made room for both, as we were situated with a number of old pasture fields. The grass the sheep ate would without them have gone to waste. The usual custom of figuring six or eight sheep to eat as much as one cow is not a sound one, as sheep and lambs will eat and thrive on what cattle would lose weight on. These sheep (the dry ewes) are still running out on the rough pasture that young cattle would fail on, and are in good condition and are no trouble, and for our conditions, we have decided that it will pay to grow more sheep and fewer weeds.

W. M. LEA, P. E.I.

A small cheese factory operated in one of the more isolated farming districts of New Brunswick

LOSSES IN SKIMMILK

Many farmers are experiencing heavy losses, says the Wisconsin Experiment Station, because they are using separators which are out of order, running the separator too slowly, or separating the milk too cold. Mr. Swoboda, in Langlade county, has made numerous tests of skimmilk and found in some cases losses of butterfat as high as 0.8 per cent. In all cases he has located the causes of these losses and aided the farmers in remedying the defects. The other county representatives are rendering similar services to the owners of farm separators in their respective counties.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

THE POTATO MARKET

At the time of writing and for some weeks past the potato market has been in a very unsettled condition.

In the Maritime provinces the potato yield of this year was, according to official report, 206 bushels per acre for Prince Edward Island, 201 bushels per acre for Nova Scotia and 192 bushels per acre for New Brunswick. The average price per bushel to farmers for potatoes is 81c for Canada, 65c for Prince Edward Island, 89c for New Brunswick, 97c for Quebec and $1.28 for Ontario. Fair yields of potatoes are recorded for the prairie provinces, the averages being between 170 and 177 bushels, with prices of 92 and 93 cents per bushel in Manitoba and Saskatchewan, and 84 cents in Alberta. In British Columbia, the average yield per acre is 189 bushels and the price 70 cents per bushel. The quality of the tubers is between 89 and 95 per cent of the standard for the Maritime provinces, over 90 per cent for Manitoba and Saskatchewan and 84 per cents for Alberta and British Columbia. For Quebec and Ontario the quality is 77 and 76 per cent, and a low yield.

Last year the potato crop was almost a total failure in the state of New York and this year there were very few potatoes in the hills and those were small in size. This and only a 60 to 75 per cent of the usual acreage under the crop means that there is not a surplus in that state.

Michigan and Wisconsin had fair crops but their acreage was low.

Minnisota also had a light crop, probably not over 50 per cent. The early crop was practically a total failure, which forced the western cities to get their early potatoes from Jersey and Long Island, where the price did not go below $1.00 per bushel as compared with 25 cents to 35 cents per bushel a year ago.

Jersey marketed all its potatoes as fast as picked up, and there is no surplus to look for from that quarter.

Cuba has afforded an outlet for a large quantity of New Brunswick and Nova Scotia potatoes, but there is still a large quantity in the hands of the farmers, although prices opened fairly low and gradually ascenled to record prices.

Prince Edward Island shippers have large quantities in stock and the Plant Liner Halifax, plying between Charlottetown and Boston has been promised full cargoes each week until the close of navigation.

Although the duty stands at 10 cents per bushel, New England buyers claim they can handle Maritime Province potatoes to better advantage than they can Aroostock potatoes. It was reported some time ago that one grower in Northern Maine had refused $3200 for 8000 barrels of spuds as he looked for higher prices.

The high prices prevailing in the Montreal and Toronto markets during October and early November had the tendency to rush and glut the markets and the large dealers and consigners have allowed hundreds of carloads to stand on the track rather than put them on the market at lower prices. They want the markets to clear a little and keep the supply low and at high prices. In the mean time demurage on the cars and expense of heating is rapidly eating up the consignors' profits, and producers, shippers and dealers generally are organizing in the larger centres to boycott the use of potatoes until such a time as trey can be sold for reasonable prices.

Consumers fail to take notice of the fact that the crop was below the average in many places and that instead of exporting, some of those places will be importing before next seasons crop is harvested, so long as they know that hundreds of carloads are freezing and rotting on the railway sidings.

Shippers claim that they do not look for much higher prices and producers who have not sold must take into consideration that there is usually a shrinkage from rot and other causes while in storage, and that even higher prices later may not net them as much as the remunerative figures now offered.

KEEP TROUGHS AND MANGERS CLEAN IN WINTER

When the horses, cattle and other farm stock go into permanent winter quarters this year, will they find their mangers clean and sanitary or will they be foul with the accumulation of dust, dirt, cobwebs and droppings from hens during the past summer or even years?

In the cow barns, the practise of watering the cattle in the stable, which is a good one under proper conditions and careful management, allows the mangers to become wet enough, at times, through the drippings from the mouths of the cattle and slopping from the basins or troughs to cause all kinds of soft material to adhere to the surface. By this means odd places that are in protected locations soon become sour through chop, dirt, etc., lodging there and these are a continual menace to the health of both the cattle and men through its being a lodging and breeding place for all kinds of germs.

In order to avoid this evil condition, the cow mangers should be swept out carefully before each meal, removing any excess of water, litter, chop or feed of any kind not eaten up clean at the last meal. By following this plan no chance for the accumulation of filth will exist; and by the way, it may be noted that, through neglect, the purest and best food may soon become a filth unfit for use.

Where mangers have been unused through the summer they should have a good washing with zenoleum or some other good germicide to kill all germs and make them sweet and sanitary.

All stable floors should have their daily sweeping; not only behind the animals where the droppings are liable to accumulate, but also the feeding floors, and all persons walking about the stable should be careful that their boots are clean. All animals are particular about their food and will refuse dirty provender. The habit of spitting about feeding floors is a filthy one and should not be allowed.

In the horse stable the mangers are usually constructed with deep tight bottoms so that the finer parts of the hay, dirt, seeds, etc., frequently become collected at the bottom and wet from leaky pails or slobbering animals and other filth. These as well as the cattle mangers should be kept clean. It is not fair to give the horse a heavy day's work or a hard drive, bring him in tired and dusty and expect him to regain his normal condition with his nose over a filthy manger and to eat his supper in a place so antagonistic to his natural tastes. His instincts will rebel and often he will refuse to eat at all rather than be subjected to such ungrateful treatment.

The man who gives no attention to these details of cleanliness and sanitation, is likely to declare them to be not only unnecessary but also a waste of time and energy. Investigation, research and statistics all go to prove, however, that careful observance of the law of sanitation have almost entirely overcome many of the most dreaded diseases of the past and is holding in check others for which no specific has ever been found. Take, for instance, that dreaded disease tuberculosis which afflicts all classes of animals as well as man and which has baffled the profession for ages; the only known remedy today is largely preventive by means of fresh air and sanitary laws, which include the idea of the prevention of the spread of disease germs by means of filth, and their destruction by means of germicides, God's pure air and sunlight.

Let all men everywhere then, receive the indisputable teaching of the age and thus overcome many of the ills the flesh is heir to by adopting cleanly and common sense methods in all departments of the farm's activities.

* * *

Fruit growers and others interested in the fruit growing industry are again reminded that the Annual Meeting of the Nova Scotia Fruit Growers' Association will be held in Lawrencetown, N. S., on January 16th, 17th and 18th, 1917. At this big horticultural event experiences will be exchanged and practical talks given by men who know whereof they speak. Plan to attend. It will give you an impetus in your work to mingle with such an intelligent class of men as you will meet at the Lawrencetown Convention.

* * *

Despite the fact that the Maritime Winter Fair Buildings, Amherst, N. S., are not available for fair purposes this year, being used for military purposes, the Maritime Poultry Association will hold their Annual Show on December 12, 13, 14 and 15 in Moncton, N. B. Don't forget the dates. F. L. Fuller, Truro, N. S., is the Secretary of the Show. Write him for information. Enter your birds and plan to attend.

Save the Heifer Calves

Under the caption "Live Stock Husbandry Leads to Prosperity and offsets the Evils of Land Mining," on another page of this issue, we have dealt with the question of live stock raising and winter dairying at some length. Stock raising has been tried and proved to be one of the best means of conserving soil fertility. This is the unanimous verdict from all countries where domesticated animals thrive. Prosperity follows horn and hoof and consequently there is a heavy demand for all classes of live stock that are used for food purposes. The abnormally high prices for farm produce of all kinds and particularly of the classes of produce that are used for animal as well as human food, and the heavy demand for food animals has caused many farmers to dispose of some of their surplus stock in an unfinished condition. They hesitate to feed high priced grain feeds and consequently animals that would stand a period of stall feeding are now finding their way to the shambles, and the surplus feed is finding ready markets at high prices.

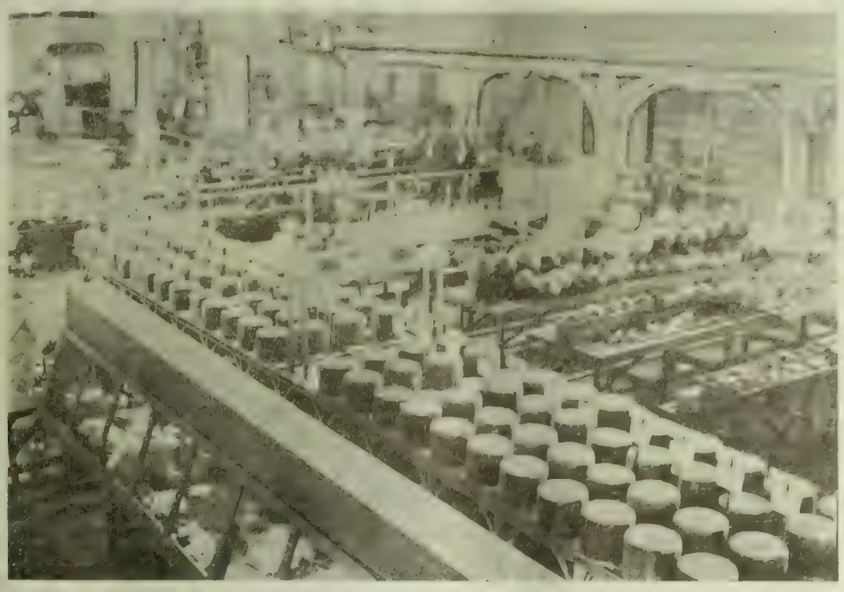

Exhibit of butter and cheese at the 1916 Charlottetown Exhibition.

But what of the future? To sell the crops direct from the farm means a depletion of soil fertility unless something is put back on the farm to offset it. Half finished cattle are always lacking in weight and quality, and consequently do not command as high prices utns.
high figures as they do when decently fitted for the block, and frequently means a glutted market at one season of the year and scarcity during the seasons when prices usually range highest.

We are told by farmers and dealers who know that not nearly so much milk is made this year in the vicinity of Sussex as was made at the corresponding time last year, despite the fact that the majority of the producers realize 40 cents and some 45 cents per 8 quart can. Thousands of bushels of turnips have been shipped at prices ranging from 60 to 65 cents per barrel. Mill feeds are out of sight and the boarder cow has heard her death knell. In a way this is a blessing in disguise, but the serious side of the affair is that not only the boarder cow but some excellent breeders and workers are also allowed to go. —As for calves, many of the farmers knock them on the head as soon as they are born, pull off the skin and throw the carcass to the hogs or bury it in the manure heap, all to save milk and feed. Hundreds of calves are thus slaughtered and their food producing possibilities wasted.

The idea of getting panicky in season of abnormal prices, be they high or low, is entirely wrong. History repeats itself and any reader who will allow his mind to revert to previous occasions, will recall that the farmer who stuck to his business in a cool, business-like way, made more money nine years out of ten, than did the panicky farmer who was strong for and with some line of farming today and out of it and into some other line tomorrow.

We predict that [illegible] after the war is over there is going to be a demand for live stock of all kinds such as was never known before in the Maritime Provinces. Farmers will do well to conserve their breeding stock and raise as many calves, particularly heifer calves, as they possibly can and be ready to take part in the business that will surely come their way.

So serious had the practice of slaughtering very young calves become in parts of the British Isles, that the government was obliged to step in and call a halt. They have enacted laws against the slaughter of young calves, not only on account of war conditions, but owing to the conditions as they existed in prewar times.

The slaughter of young calves is to a certain extent responsible for high cost of living. Slugged veal is not desirable for food, but had the young calf been saved and fed for a few weeks or longer, a large quantity of excellent veal would be the result, or if kept long enough the animal could be finished for beef. Needless to say all desirable heifer calves should be reared to take their places in the herds.

The fall calf is the desirable calf, because it can be grown to maturity cheaper than the spring calf. As was pointed out in another article in these columns. Save the heifer calves. If not criminal to slaughter so many young calves, it is wasteful, and wastefulness brings woeful want.

New Brunswick Agricultural Society United

The Annual Meeting of the New Brunswick Agricultural Societies United was held in the Provincial Government Rooms, St. John, N. B., on November 23rd.

About thirty delegates representing nearly as many Agricultural Societies from various parts of the province, were present.

As Mr. R. G. Murray, the president of the Society passed away during the year, the vice-president, B. N. Shaw of Hartland, presided.

The Secretary, Stanley Wilson of Rolling Dam, read the minutes of the last annual meeting and after adoption of same, Mr. Reed of St. John was introduced to the meeting. Mr. Reed is interested in the manufacture of Larvacide, a material which he claims will exterminate insects injurious to plant life, such as cutworms, potato beetles, etc., if used in moderate quantities in the soil. It is somewhat similar to preparations of a similar nature used extensively by farmers and gardeners in England and Scotland. Last season a small quantity of Larvacide was manufactured by hand and given to farmers in various parts of New Brunswick and Nova Scotia for trial purposes. We had the pleasure of reading letters from the various experimenters, many of whom we know personally and the unanimous verdict was favorable to Larvacide.

Mr. Reed and those associated with him are equipping a plant to manufacture Laracide on an extensive scale and will have more to say about their product to readers through the columns of the Maritime Farmer. Watch for their announcements.

H. B. Durost presented the financial statement and explaintd the operations of the year just closed. The finances are in good condition and the various transactions saved money for the Agricultural Societies who bought their fertilizer requirements through the central body.

Feeling references were made to the late president of the organization and a suitable resolution was ordered to be incorporated in the minutes and a copy sent to Mr. Murray's family.

Hon. B. F. Smith, acting minister for agriculture addressed the members and pledged the support of the Department of Agriculture in everything that tends to help along the cause of co-operation.

J. B. Daggett, Secretary for Agriculture also addressed the meeting.

For the benefit of new members, who were not conversant with the home mixing of fertilizers, Mr. H. B. Durost, Fertilizer Expert for the New Brunswick Department of Agriculture, explained the process and illustrated the manner in which quantities of the various chemicals necessary to make up formulas of stated percentages are determined.

Approximate prices for chemicals for 1917 orders were listed and some of the delegates who had their orders ready placed the same with the Secretary.

The election of officers resulted as follows:—

President—B. N. Shaw, Hartland.

Vice-President—Roy McCain, Fredericton.

Directors.—W. B. Gilman, Fredericton; Stanley Wilson, Rolling Dam; M. A. MacLeod, Sussex; W. H. Moore, Scotch Lake; R. J. Huggard, Norton.

Secretary—Stanley Wilson, Rolling Dam.

It will pay every Agricultural Society in the province to get in touch with this money saving organization.

To Specialize or Not to Specialize

To the Editor Maritime Farmer,

X-Y.—A subscriber would like to ask the following questions:

1. Which is the better plan, to combine beef raising and dairying, or to follow one line or the other.

2. In combining beef raising and dairying, which is better to have, half of your herd a beef breed and the other half a dairy breed; or to have your whole herd a dual purpose breed such as the Milking Shorthorns.

3. What would the "Farmer" consider a fair summer's yield of butter from 5 cows freshing in the spring.

Replies by J. M. Trueman, B.S.A., Truro.

1. Personally I think it better to follow one line or other, either beef raising or dairying, and not to attempt to be an expert at both. That does not mean that I would not raise any beef if I were a dairyman, or that I would not make any butter if I were a beef man. It means that I would make one or the other my leading business. If I were a dairyman I would try to be an expert in that line and to keep a first class herd of dairy cows, then if I had extra rough feed and extra pasture I might feed a few steers in addition to caring for the dairy herd.

2. I would not plan to have half my herd dairy and half beef cattle, but as suggested above would have a first-class dairy herd and buy a few feeders to make beef, or on the other hand I would have a firstclass beef herd and buy a few dairy cows to add to my butter or milk output. I do not have any faith in a dual purpose breed. The Shorthorns kept for beef will furnish a considerable amount of milk, but I would not try to breed them for both purposes. I would hold on to the beef characteristics of the Shorthorns and get as much milk as I could in addition, but would not try to make them great milk producers at any expense to their beef qualities.

3. A cow that freshens in the spring and milks for six months if given a fair chance, that is to say some grain when in the barn, and a good pasture should produce 200 lbs. of butter.

An inch of demonstrating is worth a yard of explanation.—The Main Trac'.

HORTICULTURE

A PROGRESSIVE INSTITUTE

Editor the Maritime Farmer:—

At the 2nd Annual Meeting of the Women's Institute of Halfway River and West Brook, the following officers were elected:—

President—Mrs. E. G. Lewis, re-elected.

Vice-President—Mrs. A. Hanna.

2nd Vice-President—Mrs. C. T. Harrison.

Sec'y.-Treas.—Miss E. M. Harrison.

Directors—Mrs. J. Hanna, Mrs. A. Wiles, Mrs. T. Lawrence.

Auditors—Mrs. Wm. Fulton, Mrs. Hubert Fullerton.

Our Institute has enjoyed a very successful year, the meetings being well attended and proving a source of pleasure and profit to all present. The program for each month has usually consisted of,—quotations from some famous author in response to roll call, two original papers on popular subjects of the day, read by the compilers, world wide current events by all, recitations, dialogues, speeches, and music in form of piano and vocal solos, choruses or duets. At one meeting a very interesting debate on the topic "Which has the greater advantages in bringing up a family country or city life," was participated in by all. Another rather novel and amusing form of entertainment consisted of a number of extracts being read from the Xmas number of the Institute Journal, edited and compiled by our members.

Our members have been actively engaged in Red Cross work and through their united effort the sum of $198.75 has been raised, out of which $20.00 has been forwarded to the Prisoners' Relief Fund, $25 to the British Red Cross, $25 to the Belgium Relief Fund and $125 spent in purchasing yarn and sewing supplies.

During the year a number of boxes have been forwarded containing the following Red Cross supplies:—

115 prs. sox, 13 pyjama suits, 1 helpless shirt, 65 hospital shirts, 110 handkerchiefs, 38 triangle bandages, 2 prs. pillow slips, 10 feather pillows.

EDNA M. HARRISON,
Secretary Treasurre

NAMING THE VEGETABLES

Why should there be twenty different names for the same turnip, or forty for the same tomato? This question was agitating the Ontario Vegetable Growers, in their recent session, and C. E. Durst, of Urbana, Ill., was brought over to discuss it.

"It has been charged," said J. Lockie Wilson, in this regard, "that seedsmen cater to amateurs, who are apt to purchase novelties, until by sad experience they find that the old-time standards are the best."

Mr. Durst pointed out the disadvantage of the present system of nomenclature of vegetables, as follows: "The confusion which exists is nothing more than might be expected when we consider the circumstances under which present nomenclature developed. As a body of men you are interested in the sale of seed. Your success largely depends on your advertising. Competition is keen, and one naturally inclines to take advantage of any feature that might increase sales.

"Changes now and then are only looked at from the standpoint of increased sales. New varieties are usually good advertisers, and often, on the advice of the originator, they are introduced under new names before there has been time to really determine whether or not they are actually different from, or superior to, existing varieties. The result is a multiplication of names, making it difficult for growers to buy, and lowering confidence in the dealers. Many of the undesirable sorts now catalogued will necessarily die a natural death if allowed to follow the usual course.

"One change which seems feasible, however, is a shortening of the variety names. Many superfluous adjectives could undoubtedly be dropped. It was found on investigation that Blood Turnip seed was listed by 140 firms. By the use of different combinations of adjectives, twenty different variations in the name were found, such as Early Blood Turnip, Improved Blood Turnip, Extra Early Blood Red Turnip, etc. Similar conditions exist with other vegetables. Vegetable growers would like to see seedsmen agree upon a common name in such cases. Such actions would make it possible for growers to buy the same variety from different seedsmen with a greater degree of certainty.

"Another point in existing nomenclature which is certainly worth serious consideration is the use of different names for the same variety. Take the Earliana Tomato, for instance. It is safe to say that this variety is catalogued under at least a dozen different names by various firms.

"Another point of greater concern to the growers is the large number of varieties catalogued, not infrequently as high as forty-five or fifty. The large number is due, in part, to the cataloguing of a variety under more than one name to meet the demands of different customers, but perhaps it is more largely due to the carrying of inferior sorts. In the end such procedure can not but be a loss to the seed trade as well as to the grower.

"In most cases it should be possible to reduce the number of varieties to not over ten or twelve. This would not only raise the standards of the seeds sold and crops produced but it should be a great help to the seedsmen in simplifying their business and in making mistakes far less likely.

"The growers would especially emphasize the need of purifying and perfecting existing varieties. Many of our best ones are becoming contaminated through cross pollenation with other varieties planted too near. Again, judicious selection seems to have been neglected in some cases, since the type is often quite variable."

Mr. Durst told of efforts in the United States that had been made to change the situation. These had been made since 1908, and the matter was still hanging fire, through progress had been made.

ORCHARD TROUBLES IN CAPE BRETON

R. G. Murray, Coxheath, Cape Breton, submitted the following letter to the Maritime Farmer some time ago:

"About ten years ago I planted a small orchard of apple, crabapple, plum and cherry trees. The apples and plums are nearly all dead. The crabs have been bearing well for six years, while the cherries are covered with bloom each year, but give almost no fruit. I have two varieties. Kindly let me know what I could do to make them fruit.

Following is the reply by the Dominion Horticulturist:—

In reply to the letter of your correspondent, I beg to give the following information which may be of some assistance to him:

Judging by the results it is evident that the varieties of apples, plums and cherries are not hardy enough for the district and I should suggest getting hardier sorts, although in the case of cherries it is evidently the spring frosts which are the trouble. Sometimes there will be a frost in spring when the cherries are in bloom and without a close examination one would not know that any injury had been done, and later on when the frost has been almost forgotten and there is no fruit sets, one does not know what the trouble is. If an examination is made after the frost, it will be found that the centre of the flower or pistil is blackened, although the petals may remain white, so that in the case of cherries where the injury comes in the spring, hardier varieties might not prove much more satisfactory. Unless the hardiest varieties are being tried now, it would be desirable to test them.

The fact that the apple and plum trees are dead is, I think, sufficient evidence that the varieties tried are not hardy enough. The varietis of apples recommended for Cape Breton are for summer, Crimson Beauty, Yellow Transparents; for autumn, Duchess of Oldenburg and Dudley; for early winter, Wealthy, McIntosh, and Wolf River, and for winter, Bethel and American Golden Russet, although, no doubt, some of the other sorts will do very well. The plums recommended for Cape Breton are the Arctic, Bradshaw, Imperial Gage, Gueil, Shipper's Pride, Yellow Egg, Quackenboss and Shropshire Damson. Among cherries the kinds that would be worth while trying are the Early Richmond and the Minnesota Ostheim.

Yours very truly,
W. T. MACOUN,
Dominion Horticulturist.

FORCING RHUBARB IN WINTER

Crisp, delicious rhubarb for pies can be had at little expense during winter and spring by anyone who has a garden and a fairly warm cellar. From one to three dozen clumps of rhubarb should be dug up late in the fall, and then allowed to freeze through before bringing them into the cellar.

Set the clumps of roots on the cellar bottom as closely together as possible, and pack soil in and around them. They should be put in an absolutely dark place where a temperature of 55 degrees can be maintained. A lighted lantern with a blackened globe will give heat if any is needed.

The roots must be kept from drying out by an occasional watering. The stalks, which are a beautiful light pink in color, grow to a good length with very little leaf. For convenience in handling, clumps of roots may be set in pots or tubs, although this is seldom done.

Mr. A. R. Wetmore, Clifton, N. B., grows a considerable quantity of forced rhubarb in this way.

HALLAM'S GUARANTEED
FUR COATS AND SETS

DIRECT FROM TRAPPER TO WEARER

You can save the many middlemen's profits by securing your fur garments from us.

We buy our Raw Furs direct from the Trappers for cash, and are the largest cash buyers of raw furs in Canada, buying direct from the trapper.

These furs are manufactured into stylish fur sets and fur coats at the lowest possible cost, consistent with the best workmanship.

Then we sell them direct to you at the very low catalog prices. We pay all delivery charges.

Every garment is sold under A POSITIVE GUARANTEE OF SATISFACTION TO YOU or your money back.

Our sales for fur sets and fur garments last year exceeded all our expectations and were the largest in the history of the house.

This year we confidently expect still larger sales, since the people realize more and more the bargains they obtain from Hallam.

We have in stock a large and varied assortment of all the articles shown in our FUR STYLE BOOK and can guarantee PROMPT SHIPMENT.

PRIZE CONTEST—$300 in Cash given away free in Hallam's Zoological Contest, 64 Prizes—Write to-day for the 1916-17 edition of

HALLAM'S FUR STYLE BOOK

which gives full particulars of the contest and contains 32 illustrated pages showing beautiful and stylish fur coats and sets, moderately priced.

211—MUSKRAT COAT—Made from select dark skins, well matched, deep shawl collar with cuffs. The graceful flare skirt and stylish lines of the coat combined with the handsome reverse border effect give this garment a very striking appearance made only 45 inches long in sizes of bust 32 to 44. Price delivered to you $62.50.
212—MUSKRAT MUFF to match $10.00.

RAW FURS—We are the largest Cash Buyers of Raw Furs direct from the Trapper in Canada.—Our Raw Fur Quotations sent Free.

GUNS—Traps—Animal Bait Fish Nets, Tackle and a complete line of Sportsmen's Supplies. 32 page Sportsmen's Catalogue Free.

PROTECT TREES FROM RAVAGES OF MICE AND RABBITS

There is little use of setting out trees for the orchard, ornamentation, or any other purpose without putting forth such effort as is necessary for their protection and care. It is a very discouraging situation indeed, when, after having planted and cared for an orchard or any other kind of trees, for four or five years, for the farmer to find in the spring that the greater number, if not all of them, have been seriously damaged or perhaps utterly ruined by the ravages of mice or rabbits, and yet this frequently happens.

While the depredations from mice and rabbits vary greatly from year to year, depending upon abundance of food from other sources they are usually present in sufficient numbers to do at least a good deal of harm and the only way to be secure from their ravages is to adopt some means of prevention. The greatest menace in this direction comes from grass or other rubbish being kept in the vicinity in which these pests can find protection and build their nests. On this account it is always advisable as a rule not to have the ground in the orchard covered with sod where the mice can find shelter, or brush heaps which have lain during the summer and through which the grass has grown, forming a perfect protection for rabbits.

Where mice find conditions favorable they begin their work under the snow and when they come in contact with a tender barked tree, begin at once to gnaw it if it is not protected.

One method that has been found effective is to keep the snow tramped firm around the tree. This plan, however is open to the objection that some attention is needed all winter and is liable to be overlooked at a critical time. Probably the best and cheapest plan yet tried out is to wrap the tree with ordinary building paper. With this plan the cost of material is trifling, and putting it on is not a big job. Tar paper should not be used as it is liable to damage the trees. After the paper has been wrapped around the tree and tied, a little earth should be placed around the lower end to keep the mice from beginning to work there or the paper may not prove effective.

The Experimental Farm at Ottawa reports that in trying out this system in connection with several thousand young trees, there have been practically no instances where the mice have gnawed through the paper to get at the trees.

Another method which has been used in many sections and which is sure and comparatively cheap, is the metal protection made of wire, tin or galvanized iron. These are durable and may be used from year to year.

Sunscald in some localities is a trouble to be guarded against. It is confined principally to northern districts, however, and is an injury caused by the alternate freezing and thawing of parts exposed to the hot sun in the early spring. The bark on the south west sides becomes unhealthy and finally dies and dries up. Young trees are mostly affected but it frequently occurs on limbs of older trees.

In districts where this difficulty is likely to occur some measures of protection should be adopted for otherwise serious injury is likely to occur even if the trees is not permanently destroyed. Any process that will keep the sun off until the danger of heavy frosts is past will be effectual. Building paper, old bags, newspapers or other material of like nature may be used. No doubt many trees are injured in this way and the cause not suspected by the owners.

In some parts of the country it is the custom to put a ring of manure around fruit trees and in close proximity to them. This plan should not be encouraged. In the first place the manure does very little good, if any, as a fertilizer when placed so near the tree as there are very few fibrous or feeding roots located in that position. The main roots run out beyond the spread of the limbs and on these are many laterals which carry the rootlets or the food collecting fibers. Of course fruit trees cannot be expected to bear heavy crops year after year without fertilizer or barnyard manure; but it should be spread all over the surface of the ground in the vicinity of the fibrous roots and not near the trunk of the tree where there are very few if any.

Again, when the manure is placed in a pile around or near the body of the tree it will afford a protection for mice—a thing that should be avoided as far as possible. In connection with young trees the object in their treatment should be to encourage a large development of their root system, hence the manure or plant food should be kept somewhat beyond their present location so that they will push out farther and farther for their supply. If this is not done and the tree finds an ample supply for all its needs of growth wear, no large developments of roots will take place and sooner or later the area already occupied will not furnish the required plant food; the growth and fruitage will be checked while the roots are forcing their way on out into new territory.

Neither is fall plowing in the apple orchard conductive to the well-being of the trees, as it is apt to interfere with the crop the next season. The soil is loosened up and the roots more or less exposed to the cold air of the winter. The new growth is forced beyond its natural order and does not properly harden in order to stand the severity of the winter.

WE can live without food, but not without sleep. Many will recall Dr. Tanner's 40 days without food, but who could live a single week without sleep and retain their reason.

It is during sleep that the nervous system is restored, and the nerve force, consumed by the activities of the day, is replaced.

Sleeplessness is one of the first and one of the most torturing symptoms of nervous exhaustion.

With sleeplessness you find nervous headaches, tired, wornout feelings, indigestion, lack of energy and strength. You are nervous and irritable, and cannot compose yourself to rest or sleep.

The nerve force in the body is at low ebb, and the feeble, wasted nerve cells must be nourished back to health and strength by such treatment as Dr. Chase's Nerve Food.

You must not confuse this food cure with drugs taken to produce sleep, for it works in an entirely different way. It is not a quick relief, but a restorative, upbuilding treatment. As the nerves are revitalized sleep comes naturally with its soothing influence and hastens recovery.

Sleeplessness

Mrs. Edson Brock, Trenholmville, Que., writes:—"I want to state that I have never taken anything to do me so much good as Dr. Chase's Nerve Food, and I am never without it in the house. I was so nervous I could not sleep, but now I sleep soundly at nights and wake up feeling refreshed and ready for the day's work. I used the Nerve Food for months, and found that it just suits my needs, and has built up the system wonderfully. I know it is Dr. Chase's Nerve Food that has brought about the great change in my condition, and I am thankful for it."

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

DAIRYING.

ANOTHER JEAN ARMOUR HEARD FROM. WORLD'S CHAMPION AYRSHIRE THREE-YEAR-OLD

The champion Ayrshire records are still coming to the front and breaking all previous records for the Ayrshire breed.

"Jean Armour 3rd"—32219—, a senior three-year-old bred by Mrs. F. D. Erhardt, West Berlin, Vt., and owned by W. P. Schanck, Avon, N. Y., has just completed her year's official test in the United States with a record of 21,938 lbs. milk, 859.65 lbs. fat 3.92% fat.

She was sired by the famous Howie's Dairy King, 9855, imported, and is from Jean Armour—15591—"25487", (the first Ayrshire to reach the 20,000 lb. mark for a year's milk record), bred by H. & J. McKee, Norwich, Ont.

Another daughter "Lotus Jean Armour", by Lessnessoch Gem's Good Gift, (Imp), commenced her three-year-old record on June 16th last, and gave in July 1606 lbs. milk, and in August 1653 lbs. with a test of about 3.64% fat.

Truly the JEAN ARMOURS are a wonderful family.

W. F. Stephen, Secretary,
Canadian Ayrshire Breeders' Assoc.

MILK YOUR COWS PERFECTLY DRY; WHY IT PAYS

It is important to milk cows completely. Milk left in the udder at one milking period remains there until the next. Complete milking will result in getting from a half pint to a pint more milk at each milking during the lactation period. The more a cow is made to produce the more capable she is of keeping up the performance. Strength physically is gained by exercise and using strength. An athlete who uses his strength properly becomes more proficient and capable of performing greater feats. It is much the same with the milk producing qualities of a dairy cow. When she is milked completely each time, her capacity to produce the maximum quantity of milk is maintained and she will "get the habit" of transforming her food into milk and butterfat instead of so much into body fat and growth. Incomplete milking is just as detrimental to the possible performance of a cow as careless systems of exercise are to an athlete who is training for physical strength and endurance.

We know that when we want to dry off a cow even in the flush that we simply have to leave part of the milk in the udder at each milking, skip once in awhile, and in a short time the desired result is accomplished. The production of milk is decreased and kept down just the same when the cow is not milked completely. Not only does the owner lose the milk by incomplete milking, but the cow may soon have a swollen udder which may result in the loss of a quarter or ruin the whole cow as far as milking is concerned. And beside, if a cow testing 4 per cent. butterfat be milked and the first fourth of the milk be tested it will probably only test about 2 per cent. and it may even be a little lower. The second fourth will test between 3 and 4 per cent. and keep on increasing and the very last milk, or strippings, sometimes tests as high as 12 and even 15 per cent.

Sufficient time ought to be taken to milk the cows completely, even if so much other work on the farm cannot be accomplished. A little extra time required to work and manipulate the udder by hand after the usual amount of milk has been obtained will pay dividends and often makes a profit where otherwise there would have been a loss.

It is important, too, that cows be milked at regular periods. The milking ought to be done at as near the same hour morning and evening as possible. The more equally the 24 hours are divided in which the milking is done twice the more uniform will be the quality of the milking produced. For example, if milking takes place at 6 o'clock in the morning, the next milking time should be as near 6 o'clock in the afternoon as possible. If milking is delayed the cows frequently become uneasy and the irregularity may cause considerable pain. Cows left long without milking get very distended udders and may suffer much pain. Very heavy milkers sometimes have to be milked three times instead of twice a day to relieve the pressure on the udder.

The operation of milking is one of the most critical on the farm and much of the success of a dairy depends on doing it in a proper manner.

DON'T NEGLECT DAIRY COW AT CALVING TIME

There is no time in the whole milking period that has such an important bearing on the establishment of a standard for production for the year as the period previous to and following calving time. It is understood by many, but not by all, that if a cow is allowed from six weeks to two months in which to rest from one lactation period to the next, she will yield more than when milked continuously up to the time of parturition. We know the effect upon ourselves, when our faculties are continuously at work, especially when the nerves are brought into play. And it is a fact that parturition vitally disturbs the nervous and physical activities, especially the forces of digestion. The act of calving brings stimulation to the milk producing organs, which is the only natural and effective means of stimulating milk secretion, and it is a serious mistake not to make the most of it. It is necessary to handle the cow in such a manner as to derive full benefit from this stimulation while it is yet present, since with most cows it rapidly wears off if not utilized.

At this time of year with many cows freshening in the fall, this question concerns many. Rather liberal feeding, which actually builds mild nutrients in the body, during the last few weeks of the lactation period, and while the cow is dry, is the secret of preparing the cow for the succeeding lactation period. This may appear to be wasting feed, but this is the important period when it is most valuable. During the last few weeks of the milking period grain may be fed at the rate of one pound to each two pounds of milk produced, reducing at the period when the cow is to be dried. A good many have trouble in drying off persistent milkers by the plan of skipping milkings, but when less than 14 pounds of milk is yielded, daily milking can be discontinued at any time without serious difficulty if accompanied by a reduction in the feed. The udder will become filled, but the fluid contents will soon be absorbed. When dry, about eight pounds of grain should be fed daily, more if the cow is in poor condition. It would not be profitable to feed inferior cows this way. These, however, cannot always be detected from the others unless all have an equal chance, and weeding is practiced, based upon the record of production. The grain ration should be bulky, laxative and nutritious, having slightly more carbohydrates than a milk ration, with a nutritive ratio of about one of protein to seven of more liberal feeding of grain will be carbohydrate and fat equivalent. If a high percentage of fat is sought even useful.

During this period protein and fatty tissues are actually being stored upon the body to be used in the production of milk before the cow is in shape to digest and assimilate a full ration. A cow is like a toboggan in that the higher she starts at the beginning of her slide, the faster and longer will she keep running. It is just as serious to crowd the appetite during the first month after calving as to neglect to lay on this supply of nutrients. The cow should be kept hungry. If fed all she would eat harm will be done, and a check to her flow is the natural result of going "off feed," as most cows reach their limit early by this sort of handling.

A week before calving reduce the grain to four or five pounds, feeding mostly bran and oats. On the day of calving a pound and a half of epsom salts, luke warm water and good hay are enough for a well-conditioned cow, although two quarts of bran mash may be useful. Begin the next day feeding lightly, and after four or five days introduce a grain mixture gradually. Increase this gradually about one-fourth pound per day. Do not expect a cow to handle all the feed called for by her yield of milk. If she has been properly conditioned and is coming to a good flow from one month to six weeks is early enough to get her on full feed. For from three to six months she should gradually lose the flesh stored up.—F. C. White, Conn. Agricultural College.

HOW TO AVOID UDDER TROUBLE IN "DRYING OFF" COWS

Perhaps in no time of her lactation period is the dairy cow in greater danger of "going wrong" in her udder than during the time of "drying off."

The function of this useful animal is to make milk and a knowledge of the physiology of her udder is most important, inasmuch as it will help to avoid many of the ills which are so common in the dairyman's herd.

To understand how milk is made it is necessary to follow the course of

food from the time it enters the cow's mouth until the milk is produced. From there is passes directly to the stomach through the gullet. After becoming softened by secretions there, it returns to the mouth and is re-masticated, after which it passes to the two other stomachs and reaches the fourth, where it undergoes a mixing process and then passes into the small intestines. During its progress it has been acted upon by the saliva of the mouth and the gastric juice, the liver bile, etc., and broken up in such a way that it is now ready for the nitrogeneous material, carbohydrates, salts, etc., to be received by the blood and carried to the various parts of the body for further use.

The food now being in a condition to be utilized by the animal economically, it passes into the blood and finally reaches the udder, after having passed through the liver, heart, lungs, arteries, etc., and having undergone the various purifying influences of these vital organs.

In the dairy cow, the udder is a very important organ as it is the direct means of making milk, which is the dairy cow's function.

In the construction of the cow's udder the opening at the upper end of the teat enlarges into a reservoir where the milk accumulates between the times of milking. The milk is prevented from passing out of this cistern through the teat by a small muscle, which holds it until manipulation begins at time of milking. From this cistern a canal extends farther into the udder. This branches many times and at the end of each branch there is a cluster, or lobe of tissue, very similar to a bunch of grapes. What is known as the lobe is similar to the bunch, the lobule resembling one grape and what is known as the alveoli the seeds. The alveoli are lined with small cells, in which the milk is made. These cells produce within themselves the fat peculiar to milk and also secrete the water, salts, etc., that enter into the composition of milk. The milk being secreted in these millions of small cells, which compose the udder, passes into the branches that lead to them and from these into the main branch and finally reaches the milk reservoir where it is held until milking begins. The four quarters are each constructed in the same way and act somewhat independently of each other.

From the construction of this organ, the enormous number of cells and their connection with the many avenues through which the material for milk production passes in its course before the finished product is accomplished, it will readily be seen that any injury, congestion or other unnatural condition will readily cause trouble in this delicate and complicated organism.

In the "drying off" process with many cows there is very little danger of trouble on account of their all too ready disposition in that direction; but with others, particularly those which are naturally persistent milkers, there is great danger of complications arising that will cause inflammation and ultimate hardening and destruction of cell composition.

In order to avoid any discolor of this kind an animal with a strong inclination to "hang on," should be put on a ration calculated to reduce the milk now and milked once a day for a few days. As soon as she drops in quantity, another milking period may be omitted; and still another as the flow diminishes until two or three days elapse between milkings or until the cow is finally dry.

In the process, however, great care should be exercised that no thickened milk be allowed to accumulate. If any should form during the process the cow should be stripped out quite frequently until this tendency entirely disappears. If this is not done inflammation will set in and when, next the animal freshens there will likely be trouble and a lost quarter will be the result.

No good cow should be pronounced dry and be allowed to go week after week without examination. On the contrary, she should be looked after occasionally all through her dry period as it sometimes happens that a cow will secrete enough fluid to cause trouble weeks after regular milking has been discontinued.

And again, some cows are so strongly inclined to the milking habit that it is almost if not quite impossible to get them to go entirely dry, without resorting to undesirable methods, such as drugging, etc. With this kind the best plan is to feed nourishing food to keep up the strength and develop the growing calf and continue the milking.

It occasionally happens that a cow will hold on very persistently until a short time before parturition and then suddenly show signs of a disposition to let go, in which case it is a good plan to humor her peculiarity.

In stripping cows out for drying off it is better to milk out clean occasionally, rather than taking part out oftener, and leave a portion which is liable to thicken and destroy the cell tissues.

However, by proper care and management few animals will be found that cannot be safely dried off without danger of serious complications.—O. V. J.

HAD WEAK HEART

COULD NOT WORK

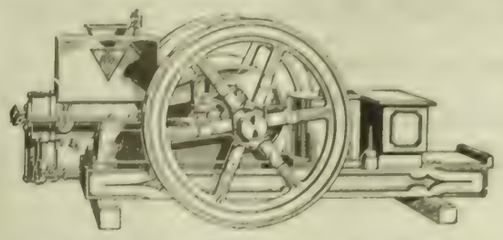
COULD NOT SLEEP.

Many women are kept in a state of fear of death, become weak, worn and miserable and are unable to attend to their household, social or business duties, on account of the unnatural action of the heart.

To all such sufferers Milburn's Heart and Nerve Pills give prompt and permanent relief.

Mrs. J. Day, 234 John Street South, Hamilton, Ont., writes: "I was so run down with a weak heart I could not even sweep the floor, nor could I sleep at night. I was so awfully sick sometimes I had to stay in bed all day as I was so weak. I used three and a half boxes of Milburn's Heart and Nerve Pills and I am a cured woman to-day, and as strong as anyone could be. I am doing my own housework, even my own washing. I doctored for over two years but got no help until I used your pills.'

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.



The cost of an ALPHA Gas Engine is less than the cost of doing without one

YOU plan to some day have a gas engine. You realize that you need one—that there are many jobs on your farm that could be done quicker, easier and cheaper if you had an engine. Your idea is that it will save money and time, which is also money.

Very true; yet, if an engine will save you money, you ought to use it right now. That is the way to save the money that will pay for the engine. When you buy an Alpha Gas Engine you begin to save. As long as you put off buying one you are losing money that would soon pay for the engine.

It is not a question of how soon you can afford to buy an engine, but how long can you afford to do without one. You surely realize that during your life time you have in one way and another lost the price of several engines, by trying to get along without an engine. Good sense demands that you stop the loss at once.

Ask us for complete information and prices of Alpha Gas Engines. They are made in eleven sizes, 2 to 28 H. P. Each furnished in stationary semi-portable or portable style, and with hopper or tank cooled cylinder.

CASTRATING CALVES

We castrate about 50 whiteface bull calves every fall, but at times the result is not very satisfactory. Nearly always some of them swell very badly and get stiff all over, and one fall we lost 4. Is it best to pull the cord or cut it?

Little difficulty or loss need be experienced in altering bull calves, if reasonable care is given and the operation is performed at the proper time. The best age to do this is when the calf is between 2 weeks and 2 months of age, preferably about 1 month old. Circumstances may arise which necessitate castration at earlier or later ages. To make it a custom to castrate grown calves in the fall, especially if weaning is considered, is grossly wrong. The best time to attend to this work is in the spring and early summer, when there is succulent grass, which materially assists in keeping up the general health to overcome the shock to the system which this operation causes.

Many rangemen of the west on picking up grown calves in the fall roundup frequently refuse to castrate them after the grass has dried up and the weather has become frosty, preferring to carry them over entire until they get on green grass in the spring. After the grass has dried up and the weather is cold the blood has a tendency to become congealed. All of these conditions cause swelling, as well as internal inflammation which it may take all winter to overcome. I have known of August having been set as the final month for castration under range conditions; any calf dropped later than this can very well be carried over until spring.

The method of performing this operation is a simple one, and with range cattle it is usually done when the calf is branded. The lower end of the purse is cut off and the testicles are split lengthwise one at a time. It will be found that the membraneous covering is attached to the upper end. After being cut loose with a knife this should be gently stripped back a few inches along the cord, after which the cord should be severed. In no circumstances should the cord be pulled out. Some prefer searing it through with a hot iron.

It would seem wise to adopt a different policy than that of having 50 bull calves which need castrating at this time of the year.—Joseph E. Painter, Denver Co., Colo.

HOW MUCH WOOL DID YOUR SHEEP CLIP?

It is many a year since it made so much difference as to just how much wool one can get from a sheep's back as right now. The war, together with certain other conditions in the world's wool market, have sent wool prices skyrocketing, and so an added interest attaches to reliable data regarding wool production.

How much wool, in pounds and ounces, will a good farm sheep produce in a year?

The Manitoba Agricultural College has a flock composed of three breeds, Oxfords, Shropshires and Leicesters, all well known and popular farm breeds in our western provinces. There are 49 sheep in flock, almost all of them pure bred, although that does not necessarily affect the weight of fleece, for a good grade flock might be made to yield as much wool, though perhaps not so uniform in quality or in weight per sheep. The shearing this year, owing to the coolness of the weather during late May and early June, was delayed until about two weeks later than usual, being done on June 8th, 9th and 10th.

The total weight of wool from 49 sheep was 479 lbs., or an average of 9.77.

IMITATING BOSSIE AND FOOLING THE CALF

Requests are frequently received for information regarding milk substitutes for calves, and how to use them. The following calf meal mixture is one which is recommended by the Massachusetts Agricultural College: 22 pounds ground rolled oats; 10 pounds linseed meal; 5 pounds flour middlings; 11 pounds fine corn meal, 1½ pounds fine blood meal; ½ pound salt. Total cost, 3 cents a pound.

Many of the proprietary calf meals are very good, but are a little more expensive than this home-made meal. The manufactured meals are usually accompanied by directions for feeding.

These meals are usually prepared by adding one-half pound of meal to 2 quarts of boiling water for each feed. At each feeding moisten the meal first with a little cold water to prevent it forming lumps, and then pour on the boiling water, and stir well. When this is cooled down to the temperature of milk fresh drawn from the cow, it is ready to feed.

It is better to let the calf have whole milk for two or three days, or a week, then gradually introduce a little of the milk substitute until within about 10 days or two weeks, when you can cut out the milk entirely. As soon as the calf will eat let it have hay and a little of the meal dry, together with fresh water. Always have the calf meal mixture milk warm when fed. Have the buckets clean and do not overfeed. A young calf will usually begin to eat hay at about three weeks old.—Chas. I. Bray.

ATTENTION AYRSHIRE BREEDERS.

Editor Maritime Farmer,

Dear Sir:—

I regret that in the report of the Dairy Test at the Maritime Winter Fair of 1915, which appeared in the Ayrshire Annual of 1916, an error exists. The report as printed, was taken from the "MARITIME FARMER", and I was not aware that any changes had been made until after the Annual had been issued. However, a corrected report will be published in the next volume of the Herd Book (Vol. 26).

Trusting this explanation will be satisfactory to all concerned, I am,

Yours sincerely,

W. F. SAPLIN,
Secretary-Treasurer,
Canadian Ayrshire Breeders
Huntingdon, Que., Association.
Nov. 6th, 1916.

In reference to the foregoing, the records of the individual cows in the Test were correct as published in the columns of the Maritime Farmer. While the Test was in progress it was alleged that one or two of the cows were not the bona fide property of their exhibitors, consequently these cows were ruled out, and cows lower down the scale moved up to take their places, as the allegations were not disproved to the satisfaction of the Directors of the Fair. The figures appearing in the Maritime Farmer were absolutely correct, the above changes being made after publication of awards.

At the time the records of the Winter Fair dairy tests were published in the Maritime Farmer, the Directors had not fully decided on eliminating the above mentioned cows from the list, as they were given to understand satisfactory arrangements would be made.

Owing to the fact that the alleged irregularity in the dairy test was not satisfactorily disproved, the exhibitors of the cows referred to, were also deprived of prizes won by their young stock in the breeders class, and stock placed lower down the scale by the judges were moved up a peg in sections where they had taken a lower place to stock exhibited by the breeders in question.

It is regrettable that any breeder should so forget himself as to make irregular entries at a fair. The Management of the Winter Fair will not countenance irregularities and he who attempts the same, may look for no more lenient treatment than was accorded the irregular exhibitor at the last Winter Fair—not only the forfeiture of prizes won on stock irregularly entered, but also the forfeiture of all prizes won, even in cases where the entries were open and above board.

INSTEAD OF PAINT

DON'T paint your pretty home this season, but use instead Velvex Creosote Shingle Stains. By so doing, you can bring out all the beauty of the wood. And think of the preservative value. Velvex Shingle Stains contain Creosote, the greatest wood preservative known. This means prolonged protection against wind and weather. It therefore means *economy.*

Velvex
Creosote Shingle Stains

Half the Cost — Twice the Wear

Velvex Creosote Shingle Stains cost about half as much as paint. And they wear much better because they penetrate the wood. They do not evaporate or dry out and of course they cannot peel off. These stains come in any color you want. They are very easily applied. You ought to investigate them. We have the complete line and we know you will like them.

Write us for a sample of wood stained with Velvex Creosote Shingle Stain.

WARM SLOP FOR PIGS

All winter long the pure-bred Poland-China hogs on the H. J. Blackburn farm in Ill., get warm slop and it takes only 10 minutes to slop 100 head. In the center of his university plan farrowing house, there is a 60-gallon farm boiler. Next to it there is a mixing vat. An hour or so before feeding time in the evening a fire is built in the boiler and the warm water is turned into the vat. There is a feed bin over that vat and the feed is let down into the vat and mixed with the water. A 4-inch pipe runs from the vat to two 30-foot concrete hog troughs. This 4-inch pine carries enough slop so that the trough is all filled at once and all of the hogs get their share.

The fire in the boiler keeps the hog house warm, and the water is warm enough for slop in the morning. Many hog men have visited Mr. Blackburn and copied this method of slopping the hogs.

INFLUENCE OF AGE ON CATTLE AND HORSE VALUES

J. C. McDowell, of the U. S. Federal Department of Agriculture, who has been investigating the influence of age on the value of cows and horses, finds that for all breeds, and for all classes of all breeds, the price of cows in good health is greatest between five and seven years, with the highest price usually at six years old. They are valued about the same at four as at eight. The explanation for this may be that though the younger animals have before them a longer period of usefulness, the older ones have already demonstrated their worth.

In all the tables compiled from the investigations the 14-year-old values for pure bred cows are much greater than for grades. This may be partly due to higher average milk production, but it is undoubtedly more largely due to the possibility that these cows may yet produce valuable calves.

Cows worth $80 at three years old are given a birth value of about $10, while those worth $100 at that age are given a birth value of about $12. Similarly the difference in value between the two classes of pure bred cows at three years of age is $100, while the difference in value at birth is in no case above $30, leaving a margin of at least $70 to cover interest on larger investment, risk of a greater possible loss, and any extra expense for feed or care.

The farm work horse according to McDowell's investigation, reaches its highest point between six and seven years of age. If still in health the value at sixteen years is 40 per cent. of the highest value. At birth the value is also 16 per cent. of the maximum value, and there is little change on the average between the ages of five and nine years. As compared with the values given for pure bred dairy cows of about the same maximum value, the berth value of horses is considered the birth value of horses is considerably less, the age of maturity a little later, and the old-age value somewhat higher.

Owing to the scarcity of standard rennet extract, there is a tendency on the part of many persons to exploit various substitutes. Some of these substitutes are not what they are represented to be and cheesemakers should be careful not to use anything which has not been thoroughly tried and recommended by some disinterested authority. Several cases have been reported of serious loss which has resulted from using coagulants of which the strength and character were not fully known.

In wintering live stock, there should be maintained the steady growth that stock makes when on summer grass. In the second place, mature animals should maintain their weight and return a profit in butter fat.

Use Rubber To Save Leather —It Is Needed In The War!

Rubber Supply Is Ample— Leather Is Scarce and Very High

Leather is being worn out faster today than ever before in the history of the world, while production is considerably less than a few years ago. While the consequent shortage is keenly felt by the civilian who has to pay half as much again for his own and his family's shoes, it is even more serious for the Government, which must supply hundreds of thousands of soldiers.

Rubber, too, is being used in enormous quantities on account of the war—one British manufacturer, for instance, is working on a rubber boot order for the army which will take 14,000,000 pounds of rubber, fabric and chemicals. But the supply, thanks to the great rubber plantations in Britain's tropical Dominions, is easily keeping up with the demands, and raw rubber, despite a war tax of 7½%, is actually cheaper today than before the war. So, though the fabric and chemicals used cost nearly double, rubber footwear has not gone up very much in price.

These conditions naturally are leading thoughtful, thrifty, patriotic Canadians to save leather just as much as possible by wearing rubbers, overshoes, high rubber boots and heavy farm rubbers. In addition to the very substantial saving in cost, rubber footwear has decided advantages for wet or cold weather around the farm or in the woods. The men like its warm, dry comfort under all conditions, and the women like the way it sheds the dirt instead of bringing it in to melt and track around the house. For the children, too, particularly if they are walking a long way to school, rubbers and overshoes mean a great deal in warmth, comfort and protection against colds.

"Doing Without" Rubbers or Overshoes Is Simply Thoughtless Extravagance

18

"VIVAT" is an energetic remedy in powdered form, prescribed with great success by prominent Veterinary Surgeons, for the absolute cure of COUGHS, HEAVES, etc. It acts as a diuretic in cases of COLICS and is prescribed for WORMS. "VIVAT" strengthens DRAUGHT-HORSES as well as RACERS and gives them endurance.

A 50c Box of "VIVAT" is sufficient for 6 days' treatment.

THE HORSE

HEREDITARY UNSOUNDNESSES IN HORSES

Profit in horseraising depends primarily upon type and sunodness. Considerable attention has been given the profitable type of horse, but the problem or eradicating hereditary or transmissible unsoundness has been overlooked or neglected by the average horseraiser. Unsoundnesses are designated as hereditary when they are due primarily to an inherited weakness of the part involved. This weakness may be in the form of one or all the following conditions: Defective conformation, poor quality of tissue, or insufficient quantity of tissue of the part involved. These weaknesses are physical characteristics and as such are transmitted to the offspring. When such offspring reach maturity and are required to do the ordinary work that a horse free from these weaknesses should do without any disturbance of function or structure of a part, then the evidences of these weaknesses begin to appear; some as loss of function, others in the form of inflammation or enlargements. Hence it is not so much the inheritance of the disease or unsoundness itself that is to be feared, but rather the predisposition due to an inherited poor conformation or poor quality of tissue. A successful breeder offers the following suggestion: "If farmers and breeders would not patronize crooked-legged stallions and crooked-legged mares in time these defects would be overcome and eradicated, and I know from actual experience that crooked-legged horses will produce crooked-legged horses and crooked legs develop curbs."

This practical interpretation of the question indicates that sidebones occur frequently because poor feet, both as to quality and conformation, are prevalent. Furthermore the frequency of the occurence of "tied in," poorly-shaped, meaty and soft hocks explains why bone spavins and boggy hocks are common. This suggests two groups of causes: external and internal. The external or immediate cause usually is the wear and tear of work-a-day life, but the internal or primary cause is the inherited weakness, which may have been passed down for several generations.

In seeking for size, quality, speed and other desirable qualities, several weaknesses have been allowed to creep in, and by overlooking them for generations these weaknesses have been intensified; hence it is absolutely necessary to discriminate severely against the unsound sire, even though he be a very good individual in every other respect. It is often questioned whether hereditary unsoundnesses materially lessen the market value of a horse. However, each of the unsoundnesses generally accepted as hereditary depreciate the market value of a horse from 25 to 75 percent, depending on the stage of development of that particular unsoundness at the time of sale. Unsound horses showing no lameness and ordinarily passed as sound by the average man are subjected to approximately the following cuts, as estimated by a member of Chicago horse market operators:

Sidebone, $25; ringbone, $50; small bone spavin, $20; small curb, $15; large curb, $30; thoroughpin, $10 to $25; bog spavin, $5 to $30; cock ankle, $50 to $75.

When a horse reaches the market his value is based upon the service he can render, and this value is measured in dollars and cents, not sentiment. Farmers—the men who usually own from 1 mare to 8 mares—are the men who produce practically 90 percnt of all the horses in this country. These men watch carefully the cattle market, the hog market, and other farm products markets, but few keep a close watch on horse market conditions. Few farmer-horsemen are familiar with the various guarantees that go with horses sold on the market, and fewer still realize the fact that these various guarantees are based largely on the question of soundness. Furthermore, 75 to 90 percent of the unsound horses which find their way to the market are hereditary unsound. It behooves every horse-owner to keep in closer touch with the horse markets and the general situation of the horse business if he hopes to secure the greatest profits.

Every horseraiser should visit one of the larger horse markets at least once each year. By so doing he will get a broader understanding of the horse business; he will realize more fully that there is a demand for certain classes of horses, while for others there is no particular demand, and he will learn more fully to appreciate the value of soundness. Recently on the Kansas City market a big, smooth gelding guaranteed to be "serviceably sound" sold in less than one minute for $310. A few minutes later another big, young gelding, at first sight apparently just as good in every respect as the one just mentioned, but offered under the guarantee "wind and work," sold for $127.50. The second gelding sold cheaply because he had a bone spavin or jack on one hind leg. This bony enlargement, which is often overlooked or excused as only a "bump", made this big, smooth young gelding sell for less than half what he would have brought had he been sound. Furthermore, soundness is as necessary in light horses as in heavy horses. A smooth, toppy four-year-old road mare with a ringbone sold for $40, while a five-year-old, just as smooth and toppy with a bone spavin, sold for $47.50. The pair brought $87.50 simply because they were unsound, while a brown gelding, not so attractive as either of the mares mentioned, but sound, sold a few minutes later for $140.

Hereditary or transmissible unsoundness are big factors in lessening the profits of horse breeders. Hundreds of thousands of dollars are lost each year simply through a lack of attention to and neglect of this problem. If the mare-owner will appreciate the value of soundness in the brood mare and will persistently and resolutely refuse to use the hereditary unsound mare as well as the hereditary unsound stallion for breeding purposes wonderful results may be obtained in a short time in eradicating unsoundness.

The following unsoundnesses are classed as hereditary: Sidebone, bone spavin, ringbone, bog spavin, thoroughpin, curb or crooked hocks, roaring (laryngeal hemiplegia), cataract, amaurosis, periodic ophthalmia, string halt, heaves (pulmonary emphysema), ridgling (cryptorchidism), rheumatism) and melanotic tumors.

If the horse producer will but give the care, attention and intelligent study demanded there is no class of live stock that will return such certain profits as horses of the right kind. The first requisite of the right kind of horse is soundness. Such horses can be produced only from sires and dams free from hereditary unsoundness or an inherited predisposition to them. The successful breeder divests himself of all sentiment, and appreciates all defects which predispose to unsoundness in both sire and dam.

C. W. McCampbell.

Kansas Agricultural College, in Breeders' Gazette.

WINTERING IDLE HORSES CHEAPLY

Below are given some results obtained at the Experimental Station, Cap Rouge, Que., in the cheap wintering of idle horses. The methods followed and the feeds used were such as to make the plan applicable to, and worth a trial in, practically all parts of the Dominion.

More horses are required.—Help is scarce, high-priced, and oftentimes unreliable, so that larger implements and more working stock have to be employed. It is not always possible to buy a good team at a reasonable price in the spring, while it is often hard to get a decent figure for the same animal in the autumn. It would thus seem advisable, when the ground freezes, to lay aside, as it were, for the winter, all horses which are not absolutely required and to feed them as cheaply as possible without impairing their future usefulness.

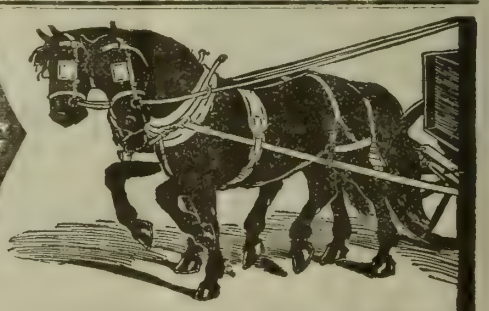
A cheap winter ration.—To gather data upon this subject, an experiment was started at the Cap Rouge Station in 1911 and has been continued during five consecutive winters, with mares and geldings, some nervous, others quiet, aged five to eighteen years. It has been found that they fared well on a daily ration of one pound mixed hay, one pound oat straw, and one pound carrots or swedes for each one hundred pounds of their weight. Not only did they gain an average of twenty-nine pounds during the five months of the test, but they showed, the following season, that they had lost no vitality nor energy.

Changes must be gradual.—The rule generally followed was to gradually cut down the work, also the feed, from November 1 until November 15, when the animals under test were placed in box stalls. They never went out, during the winter, with the exception of an occasional drive of a mile or so. On April 15, easy jobs were given to them and a small quantity of concentrates was allowed until by May 1 they could be under harness ten hours a day and were on full feed. These are important points not to be forgotten; to lower and raise the ration little by little, and to leave the horses practically idle.

Details essential to succes.—If horses, due to a hard season's work, are in low condition, they should be fed up to their normal weight before being left aside for the winter, and enough exercise should be allowed during that period to prevent stocking. Another good thing is to give a purgative so as to clean out the system before the long rest. One should also remember that some animals are more restless than others and dissipate more energy, which means that more food will be required, so that the above mentioned quantities should be increased or decreased slightly, according to circumstances.

Notes on different roughages.—Mixed hay, for this purpose, can be of any grass or weed which horses will eat, must not be mouldy or musty, and should not be worth more than half of timothy. Roots may be carrots, mangels or swedes, though the first are always liked, and the two latter are sometimes refused at first, which requires skill on the part of the feeder to have enough eaten; if roots are not given, bran should form part of the ration, as animals at rest will soon get costive and will not thrive very well on dry roughages alone. Oat straw

(Continued on page 132)



SOUND legs pull big loads. No horse with a Spavin, Splint, Curb, Ringbone, Bony Growth or Sprain, can do itself justice. Thousands of horsemen have been keeping their horses sound by using Kendall's Spavin Cure—the old reliable, safe remedy. Mr. Maurice Wayville, Amherstburg, Ont., wrote on April 20th last—"I cured a jack spavin with two bottles of your Spavin Cure. I am just taking off a bog spavin. It is the best liniment for sprains you can get for man or beast. I would like to have a copy of your "Treatise on the Horse".

KENDALL'S SPAVIN CURE

acts quickly, leaves no scars or blemishes, and costs little—$1. a bottle—6 for $5. Get our valuable book—"Treatise on the horse"—free at your druggist's, or write us 111

POULTRY.

DWARF EGGS

Almost everyone who has kept fowls has found hens' eggs as small as, or smaller than, a pigeon's egg. Such an egg may be found at any time of year, but they are most common during the late spring and early summer. These small eggs may be soft or hard shelled, but not always, of a thicker consistency than the white of a normal egg. Some of them contain a small yolk without a germ spot, but many more contain only a few drops or a coagulated lump of yolk. A few have no yolk whatever.

A century or two ago, there were a great many superstitions associated with these eggs. The name derived from the superstition once commonly accepted in a particular region often remains in use as the local name for these eggs. Thus in different places they are called "cock eggs," "witch eggs," "luck eggs," "wind eggs," etc. The most widely accepted and longest persistent of these superstitions is the one that such eggs are laid by cock birds. With the passing of the age of superstition the more descriptive term, "dwarf eggs," has come into use.

It is still commonly believed that a dwarf egg marks the end of a litter. Since dwarf eggs are most common during the season of year when the birds are most apt to be broody, it is easy to understand how the two things may seem to be related. The use of the trapnest and individual egg records, however, dispels the illusion. A dwarf egg is no more likely to be the last than the first or any other egg in a litter.

When dwarf eggs were supposed to represent the ends of litters, they were explained either as the residue left in the egg tube after the series had ended, or as the secretion of the egg tube which remained active after the ovary had ceased to function. In face of the fact that the dwarf egg does not represent the end of a series, these explanations must be abandoned. What, then, is the cause for the production of a dwarf egg?

Eight years' investigation of dwarf egg production at the Maine Agricultural Experiment Station poultry plant has thrown considerable light on this question. First, it has shown that in all cases where a dwarf egg was produced, there was evidence from the egg record of the bird, checked in several cases by immediate post mortem examination, that the ovary was in active condition and was maturing and discharging yolks. Second, in 95 per cent of the cases the disturbance was of a temporary character, since the dwarf egg was one of a series of eggs, and was preceded and followed by normal eggs exactly as though it were itself a normal egg. Post mortem examinations of many of these cases showed normal sex organs. Third, two-thirds of all the dwarf eggs contained some yolk. In many cases, post mortem examination showed that the rest of the yolk was free in the body cavity. In one case, a dwarf egg containing some yolk was found in the shell gland. Attached to the ovary was a follicle containing a partly ruptured yolk membrane from which yolk was draining into the body cavity.

From the above facts, it is clear that at least two-thirds of all the dwarf eggs result from the stimulation of a normal active egg tube by a small yolk, or more often by a part of a normal yolk, the rest of which escapes into the body cavity. In all cases the active egg tube is associated with a fully functional ovary.

During several post mortem examinations free yolk was found in the body cavity of birds which had just laid, or

(Continued on page 132)

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that."—Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.50 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

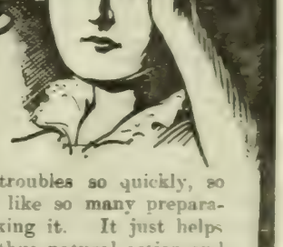
Instant Relief for
Sick Headache



Nausea and Heartburn

You cannot have sick headache when your liver is right. Dr. Cassell's Instant Relief sets it right, and that is why it cures sick headache and other bilious troubles so quickly, so surely, so thoroughly. It is not violent, like so many preparations, and you don't need to keep on taking it. It just helps your liver to regain its power, and thus natural action and natural cure follow at once.

"Science Siftings," a prominent English scientific journal, says (April 11, 1916):—"Providence has given us the brains to devise means to compensate Nature for our ill-treatment of her. . . . The means at hand come from natural sources, and we have them embodied in such splendid combinations as Dr. Cassell's Instant Relief."

Take Dr. Cassell's Instant Relief for constipation, biliousness, torpid liver, sick headache, dizziness, specks before the eyes, flatulence and windy spasms, acidity, heartburn, impure blood, and that dull, heavy feeling which is a sure indication of liver troubles.

FOR HOME AND COUNTRY

This Department is devoted to the best interests of the Homes of the Maritime Provinces. Contributors to these columns are leaders in the "For Home and Country" movement. This Department is yours. Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

HIS FIANCEE

By Esther Vanderveer.

"I may not see you again for years. Will you be true to me "

"Rather ask yourself whether you will be true to me. You are at an age when a man's fancy is liable to great changes."

"I shall not change in my feelings toward you."

"We shall see. Now, come and kiss baby; then you must be off."

Hugh Edgerton, twenty years old, had become enamored of a young widod, Mrs. Clara Pomeroy two years his senior, with a child, a girl in her third year. He had been offered a position in a banking house in Hongkong, China, and was about to proceed there. Full of the hope of youth, he was intent upon making a fortune and returning to spend what remained to him of life with Clara Pomeroy for his wife.

He followed her into an adjoining room where the child lay asleep in her crib. Bending down, he kissed her.

"Dear little thing!" he said. "When I return I will be a father to her."

He took the child's hand in his, and so soft, so dear was it that he could hardly bear to release it, but the mother admonished him that his time was limited, and drew him away.

"Goodby," she said; "whatever is in store for you and me in the future"—

"And baby."

"Yes, and baby. I will say this, you are a fine fellow and deserving of a good wife."

It seemed to Edgerton that the kiss she gave him lacked the fervor of a woman deeply in love. But it had always been so between them. The widow, though but a few years his senior, had a far wider range of experience than he, and a woman of twenty-two is usually much more mature than a man of twenty. When he regretted this lack of fervor she always said to him. "When ten or twenty years have passed it will be I who will have cause to reproach you for indifference."

While on his voyage to China Edgerton spent the most of his time writing letters to his fiancee. If an analysis of his feelings were possible it might show more distaste for leaving home and friends for a foreign land than love, but no one has yet been able to isolate love—as they say of germs—and, after all, our affections are largely a matter of association. Nevertheless Edgerton pined for his widow and the time when he would be united with her, and the dear child he had seen sleeping so peaceful and innocent in her crib was ever present in his mind.

Edgerton on arriving in Hongkong was given a position of some importance, for he had had several years' experience as a subordinate in business and was advanced rapidly. But unfortunately when he reached a status in which he might begin to accumulate the house he was with made some important losses and wound up their business. Edgerton joined forces with others and formed an independent house. They made money for a time, but one of the partners proved dishonest, and after getting him out of it they had a considerable deficiency to make up.

Meanwhile Edgerton wrote regularly to his fiancee and received letters from her. It was due to her encouragement that he was able to stand by what he had undertaken, for when ill luck befell him he was sorely tempted to give up and go home. He had with him a likeness of his fiancee, and, though the years were passing and each year added to her age, he continued to think of her as she had appeared when he parted from her. He always referred to her little girl as "the baby" and forgot that while her mother had passed the climas of youth and beauty the daughter was approaching it.

Years passed before Hugh Edgerton came to a status wherein he could close out his business in China and return to America with the fortune he had set out to win. Indeed, it was due to a fortunate rise in an article in which he had made an investment that at last enabled him to do so. It was a happy day that he announced to Mrs. Pomeroy that he was independent of the world and in a few weeks would return to claim her as his bride.

Sixteen years had passed since Edgerton had left his native land. He had been so engrossed in business that they did not seem to him more than six. Nevertheless he realized that there must be some change, especially in "baby". He pictured her as a girl playing with her doll, but nearing an age when she would lay it aside. Her mother doubtless would not have changed so much. True, she would be older, but not so very much older. As to Edgerton himself he was now thirty-six, an age wherein a man is supposed to be in his prime. His associations with women in China had been thus far with those who had not yet passed out of young ladyhood. Indeed the mothers of some of his women friends were but little older than he. One young women of nineteen, an English girl, was hoping to win him when she was disappointed by the announcement that he was about to return to America.

The return voyage seemed endless to Edgerton, so eager was he to meet his fiancee and the little girl to whom he was to be a father. He pictured himself taking his ease in his own house, surrounded by his family. The loneliness of a bachelor life in a foreign country was now to be a thing of the past.

Edgerton was the first passenger to step ashore at San Francisco, and within an hour after landing he was speeding eastward on a railway train. The day and hour of his arrival was known to Mrs. Pomeroy, and Edgerton expected that she would meet him at the station. His impatience to see her caused him to hope that she would, but his aversion to the public witnessing their meeting caused him to hope that she would not.

She did not appear. Calling a conveyance, he drove to her home. A maid opened the door for him, and so sure was he that his fiancee would do so that he came near throwing his arms around the maid. He was ushered into a drawing room somewhat dimly lighted, but there was no one there. In a few minutes, hearing a light step on the staircase, he approached the door and stood waiting. A woman entered the room, and he caught her in his arms.

She submitted to the embrace, but did not return it.

"You are as you were when we parted," he said in a disappointed tone. "You were then without warmth, and you are without it now. I wonder how you could have been true to me all these years."

Standing off from her, he was astonished to see one who looked not a day older than when he had left her.

"Upon my word," he exclaimed joyfully, "you have not changed in the least It is marvelous how you have retained your youth. I feel almost too old for you."

Now for the first time the lady ventured to speak, but she spoke not as a widow of mature ago; she was rather a coy young girl. She haltingly told him that he said what he did in order to flatter her, whereupon he vowed that he spoke the truth, and he embraced her again.

"And now," he said, releasing her, "where is baby? I must see her at once."

"You forget that baby is no longer baby; she is a schoolgirl."

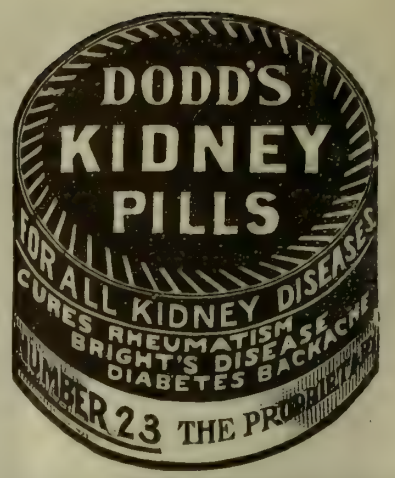
"Where is she?"

"Why, she is at school."

"At school Not here to welcome her papa? But she will return presently?"

"She is at a boarding school some distance from here." This was said falteringly as a falsehood would be spoken.

"Surely you are deceiving me. It cannot be that"—



"Clara is well; nothing has happened to her."

"Clara?"

"Of course. Have you forgotten that her name and mine are the same "

"Oh! I have always been accustomed to think of her as 'baby.' For my life I cannot understand how you can have preserved your youth. Are you sure that no rouge"—

"Not a particle."

"Surely by this time you should have a few faint lines around your eyes. I see no trace of age whatsoever. Your lips are as red as they were when I last kissed them."

And he kissed them again.

"Buy why," he continued, "do you welcome me in this dim light?"

"Perhaps when you see me in a brighter one you may see what age has done for me."

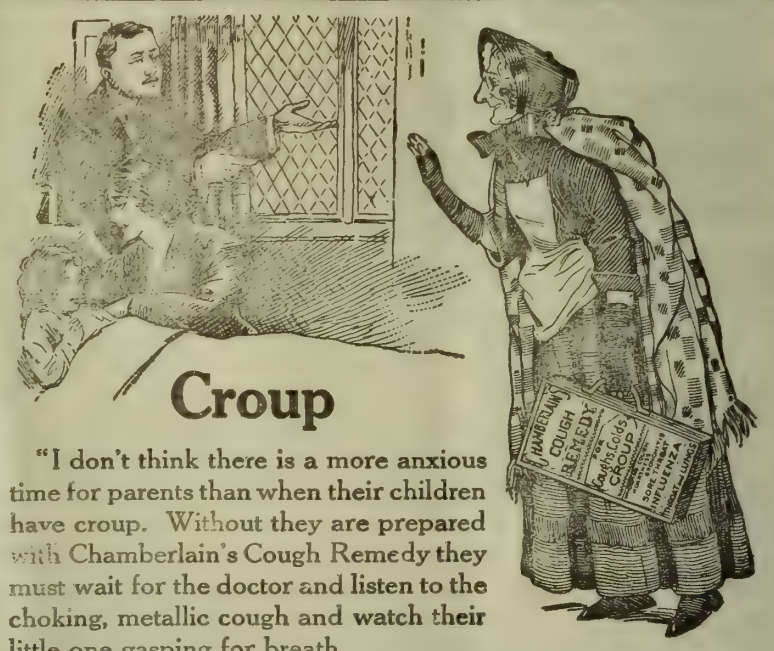
As she spoke lights were turned on from another part of the house, and a woman entered the drawing room whom Edgerton did not remember to have seen before.

"My mother," said Clara Pomeroy.

"Happy to meet you, madam," said

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.



"Granny" Chamberlain

Croup

"I don't think there is a more anxious time for parents than when their children have croup. Without they are prepared with Chamberlain's Cough Remedy they must wait for the doctor and listen to the choking, metallic cough and watch their little one gasping for breath.

You know the great danger of croup is the formation of a false membrane in the larynx, and until this is expelled relief cannot be obtained, and the spasmodic choking continues. Give Chamberlain's Cough Remedy in frequent doses. It will loosen this membrane and cause the child to expel it by vomiting.

Chamberlain's Cough Remedy

is an absolutely safe and certain remedy for croup, and if given as soon as the child becomes hoarse, or even after the croupy cough appears, it will prevent the attack."

Yours for Health — Granny Chamberlain

29

Edgerton, bowing. Then, turning to Clara: "Your mother! Why, I supposed your mother"

"Hugh!" said the lady who had entered.

Edgerton started. He looked again at Clara's mother, and there came to him a feeling that he had made a grave mistake. He turned from her to the daughter. Under the brighter light he saw that she could not be more than twenty. Turning again to the mother, he recognized his fiancee of sixteen years ago turned into a woman who, though not quite forty, looked at least fifty. Her hair was white, her skin was wrinkled, her neck under her chin was shriveled.

"I am Clara," she said, "and that is 'Baby.' When you went away I did not believe that on your return I would be a fit age for you. I look older than I am, but no man of your age should be tied to a woman of mine. Clara so nearly resembled me as I was when you left that I was tempted to put her forward as myself. The result has been as I expected. In me you looked for the youthful person you left sixteen years ago. You have found an old woman. You supposed that in Clara you would find a little girl. You have found her what I was when you parted from me."

Edgerton listened to this speech with a countenance which despite his efforts, betrayed that it described the situation. At its conclusion he began to stammer objections, but the lady took his hand, pressed it warmly and laid it in that of her daughter.

"I have no wish to influence you two except for your own good. Clara is what I was at her age, and, as I told you years ago, you are a fine fellow. I give you a good wife."

Edgerton married Clara Pomeroy, but she was of a different generation from the love of his extreme youth.

REVENGE

Revenge is said to be sweet—it isn't. Don't make the mistake of believing for a minute that it is.

There is a sort of sullen gratification in feeling that one has paid off an old score "with interest," but there is no sweetness in it; and when the first sense of triumph has passed it leaves a sting of self-reproach, of degradation that is hard to efface.

Not long ago, on a day's pleasure trip, we fell into a usual habit of studying the faces of people we met.

Near us sat two women; one of them in particular, was possessed of regular features, dark eyes and abundant hair, and her face should have been a pleasing one. It was not, however; her mouth, when she closed it, was hard and straight, and the deep furrows extended across her forehead and down her cheeks were never in the world produced by age.

Her eyes had a fashion of glancing sharply and suddenly about, as if she was constantly on the lookout for something unpleasant. It did not take the little snatch of conversation which drifted across to where we sat dreamily watching the waves to tell us that for years she had fed the canker of hatred, and fostered the desire for revenge in her heart.

"I've never forgiven her," she said. "Maybe you'll call it a little thing—but I always pay my debts, large or small, and I'll just as sure get it back on her as I live."

There it was—the hardness, the unforgiving spirit, the continual quest for the opportunity to retaliate—all pictured so plainly that he who ran might read, in the stern, furrowed, unlovely face and shifting, watchful eyes.

Oh, the pity of it—and more, that a life had been scoured, a character distorted, perhaps the happiness of a home destroyed by the hateful desire to make another "rue the day."

Because no one, man or woman, can be happy or make others happy if the wish to work harm to any living creature is fostered in the heart. Do not forget this; and commence now, this moment, to wipe out the old grudges. They have poisoned you long enough. Kill them with the antidote of good will.—Western Farmer.

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

GIRLS' COAT.

By Anabel Worthington.

One of the late arrivals in coats is seen in this picture. It is one of the straight front models with the skirt section plaited at the sides.

The collar presents the new fashion in neck finishes, cut deep and round and inlaid with velvet or satin. The general note of the season is brought out in the button decoration of the front sides, the closing is at the left side. Crown cuffs on full length sleeves correspond with the collar; the belt may be of material or a leather belt.

The body part of the coat is neatly fitted at back and in front where the double breasted effect is gained by arranging the buttons as shown and where a backward turning plait is introduced with effect.

For every day zibeline, corduroy, cheviot and like weaves are desirable. For a Sunday coat the appreciation and enthusiasm of the girl will run high if the model is developed in velvet, with raccoon fur for the collar; velour and broadcloth also are excellent materials. A serviceable and stylish coat may be developed from the pattern without difficulty.

The coat pattern, No. 8,023, cuts in sizes 8 to 14. To make in size 8 requires 2⅝ yards 44 inch goods and ⅝ yard 36 inch contrasting goods.

GIRLS' RUSSIAN BLOUSE DRESS.

By Anabel Worthington.

For a school girl, a very attractive design in a Russian blouse dress is pictured. A new touch is given by the button trimming of the shaped front where it laps the side fronts, and the pinafore suggestion is carried out by this treatment. A box plait down the centre draws attention to the back of the blouse.

A very pretty way of introducing color is to make the collar of contrasting goods and adding a tie will lend smartness. The sleeve is long with a wristband cuff and a leather belt is used to draw in the fullness at a lowered waist line.

The full plaited skirt is attached to an underwaist; it may be of plaid as shown in the illustration, or other favored fabric, and the blouse in a different weave. Or the dress may be entirely of serge, or other material, if you like. For just school wear many mothers like linen and similar tub fabric for a blouse worn under a heavy coat—the skirt being of woolen weave.

The dress pattern, No. 8,028, cuts in sizes 8 to 14 years. To make in size 10 will require 1⅞ yards 44 inch goods for the blouse, with ¼ yard 18 inch material for the collar; 2⅛ yards 44 inch plaid for the skirt, and ¼ yard 36 inch lining for the underwaist.

WASTE AT TABLE

Speaking on "Waste at the Table," Mr. Grant Ramsey, principal of the Institute of Hygiene, Devonshire Street, said a greater number of people died every year from overfeeding than from starvation, and an eminent specialist had stated that 95 per cent. of all diseases were due to errors of digestion. Two good meals a day were enough, but it was the quantity eaten, rather than the number of meals, which mattered, and three might be taken with equal benefit if they were not too large. The custom of having cut bread and butter was very wasteful, as often only half of what was cut was used, or people were induced to eat more than they needed, because it was on the table. Bread was tremendously wasted. It should be kept in stone jars, and when cut turned down on the side that had been cut. Butter, too, was very often wasted by making it into pats, which depreciated its keeping quality by giving it a larger surface to the air. Both bread and butter were better kept in bulk.

REMOVING VARNISH

Many women have their floors varnished, and the varnish is chipping and there is nothing apparently to do but put on another coat and renew the operation every time the varnish is so much chipped that it makes the floors unsightly. There are many things recommended for removing varnish, each warranted to take it off with but little trouble. Personally, I think from much experience that it is impossible to take the hard floor varnish off without considerable trouble, but it can be done. The best remover I have tried is plain, simple lye. Get a can of lye and put it in an old pail or kettle and pour on warm water. Do not put it in any vessel that you wish to use for anything again. Also, if the water is hot, be careful where you have it, for it is likely to boil over and destroy everything in sight, and burn your hands if you touch it.

It would be a good plan to put the pail in the middle of the floor you wish to clean and put the lye in dry and then add the water, and be careful not to inhale the fumes. When the lye is melted, take a long handled brush and rub the lye water over the floor. Let stand for a while and rub on again. To remove, mix with great quantities of water and wash out with a broom, or if it is not possible to wash it out, it may be wiped up with safety if enough water is mixed with it.

In finishing a floor I would strongly advise anyone who wants a floor that will not require refinishing often to refrain from using varnish. I have used plain varnish and varnish stain and both were unsatisfactory. They invariably chip when a heavy piece of furniture is moved over them or someone with nails in their boots walks on them. A stain and wax finish is not so bright as the varnish, but it is hard and will wear regardless of what goes on over it.

THE WOOD IN VIOLINS

The front of a violin is usually made of deal, the back of maple. Now, a piece of wood can be set in vibration just like a string in tension, and a certain musical note will be the result, the pitch depending upon the length, thickness, and density of the wood. The curious fact has been established by experiment that in all the best Stradivarius violins the "note" produced by the front of the instrument is the same; and again, that in no case is the note of

GOLD DUST

FAIRBANKS
GOLD DUST
Washing Powder

the front the same as the note of the back. It is known that there are acoustic reasons for this, and these reasons determine the kind and quality of the wood. The front of the instrument must be light, soft, and porous, and deal answers best to these demands. When the wood is dry, the microscope will reveal a multitude of little hollow cells, once filled with sap. The more of these cells there are, the more quickly will the wood vibrate to the sound, and here fine skill in selecting the wood comes in. The maker might cut up a dozen pieces of deal, and perhaps only one piece would be absolutely perfect for its purpose. Similarly with the maple, of which the back of the instrument is made. This is a harder wood, containing less sap, and consequently fewer cells when dry. It is used because it vibrates more slowly than deal, and the effect on the violin is to detain the waves of sound radiating from the deal and to mix them with slower vibrations of the back in the hollow of the instrument. The ribs and sides of the violin are of maple, and these serve to connect the quickly vibrating front with the slowly vibrating back and hold them until both throb together with full pulsation and body of sound.

HEADACHE

There are many things that produce headache, among them being long-continued straining of the eyes, sudden excitement, bad air and want of ventilation, alcoholic drinks, and a variety of other causes. Another fruitful source of headache in men is the absurd fashion of hats which society now imposes. Tight boots and shoes will also cause headache and destroy comfort, grace of motion and happiness. They prevent the flow of blood to the extremities and cause slight congestion of the brain. Tea drinking is often an unsuspected cause of headache, causing, as it does, exhaustion of the nervous system, and coffee the same thing. This is a drink which people are very apt to abuse, and those who find it injurious should discontinue its use. Going without sleep or taking too little sleep produces headache. Most people require eight hours out of twenty-four for sleep in order to perfectly restore the nervous system. The headaches of old age are generally caused by taking too much food—more than is required by the work done and more than can be digested. The remedy for this is moderation, for as the powers of life wane they should not be taxed more than is absolutely necessary.

ABOUT THE EYES

When a child or a young person is afflicted with nervous trouble and headaches, the causes for which seem obscure, it is well to consult a good oculist.

It is not generally known that very few people or children have eyes exactly alike. Eyes, to the inexperienced, may look precisely alike as to form and colour, when they are in reality dissimilar.

Where there is a physical difference in a pair of eyes, those eyes focus at different points, and the eyes in their effort to accommodate themselves to the conditions named are put to unusual and unhealthful strain, and consequently the brain is to this extent disturbed, causing headache, nausea, and different nervous symptoms.

Where eyes do not focus correctly, sometimes a slight operation cures the irregularity. In most cases the patient will prefer to wear specially prescribed glasses. These glasses relieve the eye-strain by enabling the eyes to focus alike, after which the nervous troubles and headaches disappear.

FRESH AIR AND BATHING

Abundance of fresh air day and night is of vital importance to all babies at all seasons, but of even more importance, if possible, n summer. If you have to keep your baby in the city, you should get up very early, give him a cool sponge bath, then his morning feeding, and take him out for an hour or two before the pavements become heated. By 11 o'clock he should be put in his crib in a shaded place for a two-hour sleep—three hours is not too much in midsummer. He should be absolutely alone and quiet during this rest period. Be sure that he is protected from flies and mosquitoes by netting. He should be taken out again in the late afternoon when it begins to grow cooler.

Keep the windows open top and bottom by day and at night. All windows should be wide open and free from obstruction. There should be a continuous stream of cool air from the outside passing across the room and out of a door or window on the opposite side. Baby's crib may be sheltered by a low screen. If you can possibly arrange, let the baby sleep outdoors at night.

CORNS, SOFT AND HARD

You can easily cure the soft corn, which is often perfect agony. I learnt that only in recent years from a lady friend. None of the doctors' books said anything about it. All you have to do with a soft corn is to get a little powdered chalk, and rub it on with cotton wool every night. Very soon your trouble vanishes. The sensitiveness is apparently due to the moisture, and disappears when the place is kept thoroughly dry. You can also cure a hard corn if you have

"My Kidneys are a constant worry to me."

That is because they are Weak. Let Dr. Cassell's Tablets give them Strength and Activity.

A little strength is worth a lot of drugs in curing kidney trouble. Vital strength, generated in the nerve-centres—the power-stations of the body—is the living force that keeps the kidneys healthy and active.

That explains why Dr. Cassell's Tablets are so good for your trouble. They nourish the nerve-centres, and thus keep the kidneys supplied with all the motive power, all the strength they need. There is nothing random in that method of treatment; it is wholly scientific. Test it, prove it by taking Dr. Cassell's Tablets. They must help you as they have helped others. Read what a scientist says of them:—

Dr. CHAS. FORSHAW, F.R.M.S., F.C.S., D.Sc., &c., a well known English scientist, writes: "My knowledge of Dr. Cassell's Tablets leads me to the opinion that the ingredients form a remarkably potent medicine (quite safe for young and old) in cases of nervous prostration, debility, anæmia, malnutrition, and many forms of stomach and kidney trouble."

Dr. Cassell's Tablets.

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative and Anti-spasmodic and of proved therapeutic value in derangements of the nerve or functional systems of old or young. They are the recognised remedy for

Nervousness	**Sleeplessness**	**Indigestion**
Nervous Breakdown	**Anæmia**	**Palpitation**
Neurasthenia	**Malnutritions**	**Kidney Trouble**

Specially valuable to nursing mothers and women of Middle life.

Sold by Druggists and Storekeepers throughout Canada. Prices: One Tube 50 cents, six tubes for the price of five. War tax two cents per tube extra.

Fruit juices may be given very early, those mentioned before, prunes and orange juice. Give the juice between feedings so that there need be no cause for a sour stomach.

Scraped fruits, such as apples, pears, peaches and plums, may be used in small quantities if great care is taken first that the fruit is neither too ripe or under ripe and that there are no lumps to be swallowed.

Children who suffer with swollen gums will be greatly refreshed by fruit juice or scraped fruit. And how many worrying babies, who cannot tell what they want, would rejoice if given frequent drinks of pure, cool water.

A child's digestion is much more rapid than an adult's, so it is necessary that they be fed oftener and in small quantities. At 15 to 18 months a child will need some such a diet as to food and time as this—at 7 or 8 a breakfast of a cereal, bread and toast and a cup of milk; at noon an egg, potato, one other vegetable, bread, fruit, either scraped or as juice; at 5 or 6, milk from a cup and bread; at 10 a cup or bottle of milk. Vary the cereals so that they may become accustomed to like a variety. The chief thing to remember in cooking cereals is to cook them long enough. Serve with good milk, with no sugar. The child gets the right kind and all the sweets that are good for him in the fruits he eats at this age.

Foods that must be denied children should not be put temptingly before them and that is one good reason for having little people eat alone. Their own food needs to be palatable and attractively served. Table manners may be learned, at a very early age. Children should eat at meals, not between, for the digestive tract needs rest.—Nellie Maxwell.

TROUBLE WITH RANCID MEAT

In the fall when we cure our pork we dry-salt it, using 8 pounds of salt and 3 pounds of sugar to 100 pounds of meat, divided in three; the meat is rubbed thoroughly every three days with the mixture. Then days after the third rubbing it is hung up to dry. Why does the meat become dry, and get a rancid taste? All of the outside of each piece is so rancid it cannot be used.

Difficulties of this kind often are due to causes which can be prevented by proper precautions in handling hogs before slaughter and cooling the meat before salting. It is advisable to keep hogs off grain feeds for 24 hours or more before butchering. Plenty of water should be given, and grass or other succulent feed does little or no harm; but hogs which are full-fed up to the time of slaughter do not bleed nor cool out so well as those which are taken off feed beforehand. They should be quietly handled when bringing them to the butchering place, so as to avoid any straining of the muscles or joints or getting the animals heated or excited. Otherwise the meat may not take salt properly because of a feverish condition, blood clots or souring of the "joint waters."

After butchering, the dressed hogs should hang until the animal heat is out of the meat. At 34 to 40° F., which is the most favorable temperature for hog killing, hogs of medium size will cool in a few hours. When butchering must be done in warmer weather, usually it is advisable to let the carcasses hang over night before cutting and salting. The curing formula used by the correspondent may be reduced to 5 pounds of salt and 2 pounds of sugar with good results; and many prefer to add 2 ounces of saltpeter, which tends to prevent shrinkage, improve the flavor and brighten the color of the meat. It may be that wrapping the cuts after smoking would prevent the difficulty by protecting them from insects. First sprinkle a little ground pepper over each piece and rub into the surface, wrap in clean papers and cover with canvas or muslin. A coating of lime whitewash containing a little glue or a yellow wash made of barium sulphate, glue, chrome yellow and flour sometimes is used where insects are very troublesome.—Louis D. Hall, Department of Agriculture.

JUST-A-GLANCE

WHEN you can see things baking; why, half the work is gone.

No bending to look into the Handy-height Oven.

No opening the Clearview Oven Door—and jarring the good things before they are done.

Just a glance as you go about your work tells how well things are going in your Lighter Day Coal Range.

White Porcelain Enamel and Nickel Finish. Booklet, fully illustrated, on request.

LIGHTER DAY HIGH OVEN COAL RANGE

Clare Bros. & Co. Limited, Preston. 12

patience and perseverance enough to endure a good deal of pain and perhaps lameness. Cut off the hard top and apply strong nitric acid with a bit of stick—the butt-end of a lucifer match will do. Cut off again and repeat in about ten days, and so on till all is gone. But most people don't care to do this, and keep themselves easy merely by cutting the corn until all the white core is out. Then you have comfort for a fortnight or so, when the process has to be repeated. —"Preston Guardian."

WHAT CHILDREN SHOULD EAT

"Ah! what would the world be to us
If the children were no more?
We would dread the desert behind us
Worse than the dark before."

It is often difficult to know just what kind of food to give second year children and how best to prepare it.

If during the first year the child has learned to like fruit juices, such as orange and unsweetened prune juice, the state of scraped fruits will easily follow.

All changes in a child's diet should be made very carefully and when any new food is introduced it should be given in small quantities, a teaspoonful or two being sufficient. Baked potato is one of the easily digested vegetables and seems particularly adaptable for a child's food. A little milk is best to use on it at first with a bit of salt, then cream and butter may be added. After a child has become accustomed to potato a teaspoonful of finely mashed, seasoned peas may be given, carrot, spinach, string peas and any vegetable not too woody.

Given in small quantities, finely mashed and well seasoned, a small child will learn to like all vegetables as soon as he is served with them. In fact he will never have to learn to like the most valuable of all foods, the vegetables.

Unprofitable

A six-weeks-old calf was nibbling at the grass in the yard and was viewed in silence for some minutes by the city girl.

"Tell me," she said, turning impulsively to her hostess, "does it really pay you to keep as small a cow as that?"

CROWN BRAND CORN SYRUP

Everybody's Favourite

Children think only of the sweetness and delightful flavour, on Bread, Toast and Griddle Cakes.

But "grown-ups" know of the splendid food value of this famous table syrup—how wholesome and nutritious it is—and far more economical than preserves, or butter and sugar, when spread on bread.

Get "Crown Brand" in the 3 pound "Perfect Seal" Glass Jars—or 2, 5, 10 or 20 pound tins, if you prefer.

Write our Montreal Office for a copy of our new recipe book—"Desserts and Candies"—sent free.

Had Pneumonia

DR. WOOD'S NORWAY PINE SYRUP CURED HIM.

A cough is an early symptom of pneumonia. It is at first frequent and hacking, and is accompanied with a little tough, colorless expectoration, which soon, however, becomes more copious and of a rusty red color, the lungs become congested and the bronchial tubes filled with phlegm making it hard for the sufferer to breathe. Males are more commonly attacked than females, and a previous attack seems to give a special liability to another.

On the first sign of a cold or cough you should get a bottle of Dr. Wood's Norway Pine Syrup and thus prevent the cold from developing into some serious lung trouble.

Mrs. E. Charles, North Toronto, Ont., writes: "Two years ago my husband had a very bad attack of pneumonia, and the doctors said he was getting consumption. A friend came in to see me and told me to get Dr. Wood's Norway Pine Syrup. I got three bottles, and they seemed to quite clear his chest of the phlegm, and now he is fine and well.

I shall never be without it in the house as it is a very valuable medicine."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c.

The genuine is manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

CHILDREN'S COUGHS

and how to Cure them with

VENO'S LIGHTNING COUGH CURE

The efficacy of Veno's Lightning Cough Cure is the wonder of every mother who uses it for her children. It cures Whooping Cough, Bronchial Cough, La Grippe, every kind of cough and cold to which children are subject. And it cures so quickly and thoroughly that all anxiety is soon set at rest. There are no dangerous ingredients in Veno's; it suits the constitution of children, and that is why it is so good for them. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

WINTERING IDLE HORSES CHEAPLY

(Continued from page 126)

should be used, as it is more palatable than other sorts.

How to feed.—It would probably be well to chaff at least half the hay and straw, but as the idea is to lower expenses, there seems no doubt that the cost of cutting these roughages would be greater than that of the extra feed necessary to supply the energy used in masticating them. The roots were sliced, most of the time for the experiments, and it seems better to give them thus, though it is not absolutely necessary, as long as they are not of such sizes as to be swallowed whole, when there may be danger of choking.

When to feed.—It was noticed at Cap Rouge that the legs of horses kept in box stalls, and fed as previously described, did not stock up. If there is no box stall, it is advisable to turn the animals out every day, when the weather permits, so that they may take some exercise. In this case, it is probable that somewhat more feed will be needed, to make up for the lost energy and heat. As to the number of times to feed, it seems that twice a day is sufficient, and that about the same quantity can be given both morning and evening.

DWARF EGGS

(Continued from page 127.)

which still held in the egg tube, a yolkless dwarf egg. Also several yolkless dwarf eggs contained one or two apparently perfect chalazae. In these cases it seems possible that all or a part of a yolk may have entered the egg tube, started the secretion of the egg white, and may then have been extruded, leaving behind enough of the white to furnish the stimulus for the completion of the egg. It is known certainly that the discharge of a yolk from the ovary into the body cavity when there is no stimulation of the egg tube does not result in the formation of a dwarf egg or in the production of any secretion in the egg tube. In a single case, a yolkless dwarf egg containing a small lump of hardened egg white was found in an egg tube and no yolk was found in the body cavity. It has also been shown experimentally that in certain cases an active egg tube can be excited to secrete egg white and shell around an artificial yolk when all possibility of the entrance of a yolk is excluded. It is, therefore, probable that in a small per cent of the cases, dwarf eggs are produced by the stimulation of an active egg tube by a small lump of hardened egg white left in the duct or abnormally secreted by a blood clot or by some other firm foreign particle which in some way enters the tube.

In 5 per cent of the cases of dwarf egg producers, the laying of dwarf eggs became habitual. That is, they eventually produced only dwarf eggs. Post mortem examinations of several of these cases showed a constriction of the egg tube (usually by a tumorous growth on the walls), which prevented the passage of a normal-sized egg, but did not entirely close the tube. In many of these cases, all or a part of the dwarf eggs contained yolk. In other cases they contained one or two chalazae, while in others they contained lumps of hardened secretion, etc.

It is then apparent that whether dwarf egg production occurs once only or many times in succession, its cause is the same. It is due to the mechanical stimulating of an active egg tube associated with a functioning ovary. In a large per cent of cases the stimulating agent is either a small yolk or more frequently a part of a normal yolk, the rest of which is discharged into the body cavity.

Chas. D. Woods,
Director Maine Experiment Station.

Gillette KNOWN THE WORLD OVER

THE WHOLESALE DEPLETION OF POULTRY LAYING AND BREEDING STOCK NOT WARRANTED UNDER PRESENT CONDITIONS

Judging from the unprecedented heavy deliveries of poultry on the central eastern markets so early in the season, it would appear that farmers and producers generally are not only depleting their flocks unwarrantably but also rushing them to the market in an unfinished condition. As a result, the current price of chickens is much below normal value at the present time, in comparison with the prices of other meats. This is directly due to the overloading of the market.

With the brisk inquiry for Canadian poultry from Great Britain, it is expected by exporters that the demand for well-finished, good quality stock will be very keen during the coming winter. Besides, there will be a good demand for home consumption. The price for well-finished birds continues firm, but with so much poor stock arriving wholly unsuited for either storage or export, many buyers have re-

Trappers!

cently reduced their quotations for all low grades.

The presence of pullets and young fowls has also been noted in many shipments. This is most unfortunate considering the price of eggs. The very firm prospect for the profitable marketing of all poultry products points to the necessity of conserving in every possible way all suitable laying and breeding stock. Unless this is done, there will be but little poultry left in a short time on the farms in the central eastern portion of the country. Even though feed is scarce and high, it would pay farmers well to finish the birds before offering them for sale and spread their deliveries over a longer period.

Current receipts to date have consisted mainly of live poultry. The season is now sufficiently advanced, however, to warrant more liberal shipments of dressed poultry. In light of the fact that there will be a considerable movement of Canadian poultry to Great Britain, it is of the utmost importance that all poultry killed on the farms, in addition to being well-finished, be properly killed and dressed. The British market, in fact all large markets prefer poultry bled in the mouth and dry picked. While killing by dislocation may be preferred by some, the presence of blood in the neck and the resultant discoloration make it unsuitable for storage or export purposes.

Proper and complete bleeding is most essential. Sometimes the arteries of the neck are not completely severed, the bird fails to bleed properly, with the result that the carcass takes on a reddish appearance. With proper attention to details, a useful reputation for Canadian poultry can be established on the British market this year. It is of the greatest importance, therefore, that all poultry marketed be well-finished, well bled and dressed and packed in the most attractive manner possible.

IMPORTANT NOTICE TO SCHOOL TEACHERS

The Scotsburn Creamery Co. is offering cash prizes for the largest average production of butter fat per cow owned by patrons.

Among the special prizes is one offered by H. R. Brown, Recorder of the Scotsburn D. R. C., ten dollars worth of books to the school library of the section whose ratepayers send the most complete records. Non-patrons may compete. No section sending less than six complete Herd Records will be eligible; a complete record being one which covers the full milking period, or 12 months. Full information cheerfully furnished by H. R. Brown, Wallace Bay, N. S.

Teachers can assist materially in this praiseworthy competition. May one or two suggestions be offered. Lumbering and fishing are becoming more and more supplanted by straight agriculture. Dairy farming, the most specialized branch of agriculture, means ample cash remuneration if good cows are kept. Nova Scotia is an almost ideal dairy province, soil, climate, markets, people, all favour it.

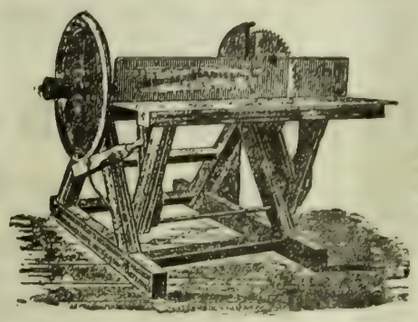
There are excellent cows in the province, there are also many poor cows. Many bring in less than forty dollars per year to their owners. Last year there were 478 herds supplying cream to Scotsburn creamery. Each herd appears to average less than 6 cows. Supposing the forty dollars advanced to fifty, or sixty dollars income per cow, what would it mean in hard cash to the farmers along the short line railroad? It is over ten thousand dollars!

The average yield per cow can be wonderfully increased. Hundreds of other farmers in Canada have done it, by weeding out poor cows, by better systems of feeding and care. Dairy records prove this, and aid in intelligent selection of the best cows; such records are easily kept and often interest the boys and girls. Could you base some of your arithmetic questions on cows' production? Will you take an hour occasionally for a talk on dairying? Questions on milk and its products open many wide avenues.

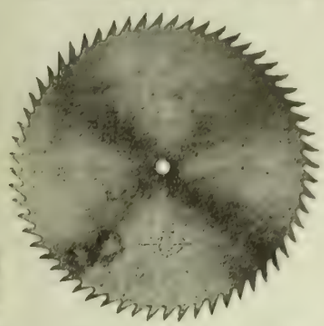
Your kind assistance is solicited.

Sussex Wood Cutters Cut Expenses

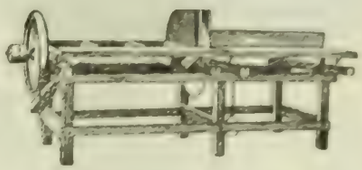
Consult Our Quality Line Before Buying



Short Swing Wood Cutter



Wood Cutter Saws guaranteed at the right price. All sizes. Prompt delivery.



Flat Roller Table.

CONVENIENCE ECONOMY DURABILITY

are the three money-making qualities embodied in our Wood Cutting Machines. No frail parts to give out in a season's use. Built to last a life time. Frame is made of well seasoned birch, bolted and mortised; table of heavy steel plating in one piece.

Swing Table Machines built on skids, bearings supplied with compression greese cups. Especially adapted for use with gasoline engines. Made in four styles—Long Swing, Long Swing Improved, Short Swing, Flat Table.

Ask for our Catalogue and Prices, it will pay you.

Remember we also manufacture Trenholm Gear Hay Presses, Grain Grinders, Root Pulpers, Feed Boilers, etc.

GROWING POTATOES FROM SEED

A subscriber in Pictou County, N. S., writes:—I was much interested in your article on page 87 of your November 21st issue, entitled "Potato Seed Bolls". After reading about Mr. Rozee's exhibit at the Yarmouth Exhibition in the columns of the Maritime Farmer, I was interested enough to collect a quantity of seed bolls and wish to know how to proceed to make use of the seed.

Ans.—New varieties of potatoes are originated from seed which is found in the bolls produced on the vines. The seed which is light and fine should be saved in the same manner as the seed from tomatoes.

Cut open the bolls and squeeze out the seeds into a small vessel with as little pulp as possible. Add warm water and allow the mess to ferment for two days so that the little seeds will wash clear from the pulp. After being washed the seeds should be dried, in which condition they will keep through the winter. Anyone who tries to carry the seed boll through the winter will likely lose all the seeds.

Along in March prepare some fine rich light soil that will hold moisture. Rotten cow manure several years old is better than common soil. The seed may be planted in a hothouse, coldframe or in a box in the kitchen window. It should be covered very slightly with soil and must be kept moist by frequent watering or by covering with a piece of cloth until the seeds begin to break ground.

To Investors

THOSE WHO, FROM TIME TO TIME, HAVE FUNDS REQUIRING INVESTMENT, MAY PURCHASE AT PAR

DOMINION OF CANADA DEBENTURE STOCK

IN SUMS OF $500 OR ANY MULTIPLE THEREOF.

Principal repayable 1st October, 1919.

Interest payable half-yearly, 1st April and 1st October by cheque (free of exchange at any chartered Bank in Canada) at the rate of five per cent per annum from the date of purchase.

Holders of this stock will have the privilege of surrendering at par and accrued interest, as the equivalent of cash, in payment of any allotment made under any future war loan issue in Canada other than an issue of Treasury Bills or other like short date security.

Proceeds of this stock are for war purposes only.

A commission of one-quarter of one per cent will be allowed to recognized bond and stock brokers on allotments made in respect of applications for this stock which bear their stamp.

For application forms apply to the Deputy Minister of Finance, Ottawa.

168 KING STREET E. - TORONTO

The plants come up quqickly and should be transplanted and handled like tomatoes. They will frequently produce tubers the first year that will weigh a pound. Each seed will produce a distinct variety. Promising new varieties must be grown for several years and tested in the fields alongside of standard sorts for at least two years before their true value can be determined.

Perhaps Mr. Rozee will tell us how he managed his very successful experiment.

SUSSEX & STUDHOLM

The Annual Meeting of the Sussex & Studholm Agricultural Society was held in the Agricultural School, Sussex, on December 1st.

There was a good attendance of members and others interested in the work of the Society. Several new names were added to the list.

J. T. Prescott, the president of the Society presided. Minutes of all meetings held since last Annual Meeting were read by the Secretary and approved.

The question of changing the annual meeting date from December 1st to an earlier date was discussed as per the notice of motion brought in at the 1915 Annual Meeting by the Secretary. It was found desirable to change the date of meeting because all reports are supposed to be in the hands of the Secretary for Agriculture, Fredericton, on or before December 1st.

Fertilizer orders should be in the hands of the Secretary of the Society as long before December 1st, as possible.

On motion of W. F. Mosher, seconded by H. R. McMonagle, the annual meeting date will henceforth be on the second Monday in November of each year.

The committee appointed to meet the Sussex Board of Trade and Town Council to solicit the assistance of these bodies in the carrying on of an Agricultural Exhibition in Sussex.

Agricultural Exhibition in Sussex reported that two meetings were held but no definite action was taken by the Town Council re financial assistance.

The committee appointed to interview the stock holders of the Sussex Driving Park Association re the disposal of their stock to the Sussex and Studholm Agricultural Society, met with a good reception by the various parties interviewed, many of whom expressed their willingness to donate their shares to the Society.

A committee consisting of E. O. McIntyre, J. Frank Roach and M. A. MacLeod, was appointed to interview said stockholders and arrange for transfers.

The financial statement and auditors report were read by the Treasurer. The finances of the Society are in good shape and the various transactions re Seed Fair, Purchase of Fertilizers, Sale of Wool and Grain Growing Competitions have been highly beneficial to the members.

Over 3200 pounds of unwashed wool were sold netting the growers 38¼ cents per pound.

$119.75 were distributed in prizes at the Seed Fair.

The Grain Growing Competition prizes amounted to $350.00.

By the co-operative purchase of fertilizers the members effected a saving of from $9.00 to $15.00 per ton, according to grade purchased.

Is it any wonder that farmers who have their own best interests at heart, become members of the Society and participate in the benefits of the organization,

It was unanimously agreed to continue the Seed Fair, Grain Growing Competitions, Wool Sales and Co-operative purchase of fertilizers.

The election of officers resulted as follows:—

President—J. T. Prescott, re-elected.

Vice-President—J. F. Roach.

Directors—Hon. J. A. Murray, Col. H. M. Campbell, J. Titus Barnes, F. Leslie Walker, W. F. Mosher, H. R. McMonagle, H. B. Parlee, E. O. McIntyre, A. D. Freeze, W. H. Venning, R. S. Parlee, H. N Flewelling, William Jamieson.

Delegates to New Brunswick Farmers' & Dairymen's Association:—A. D. Freeze and J. F. Roach.

Substitutes—H. R. McMonagle and H. N. Flewelling.

ST. STEPHEN & ST. CROIX

The eighth annual meeting of the St. Stephen and St. Croix Agricultural Society was held recently, President F. M. Murchie occupying the chair and a large number attending.

The energetic secretary of the society, Walter S. Stevens, gave an interesting review of the work of the society during the past year and dealt with many features of the recent successful fair.

R. W. Whitlock, the efficient treasurer, gave a careful review of the financial transactions of the society, showing among other features, a profit of $935.00 on the work of the year.

On motion the president appointed J. W. Scovil, M. W. McCormack, M. N. Cockburn, L. B. Mitchell and R. W. Whitlock a committee to name the board of directors for the coming year, and on their recommendation the following were appointed:

F. M. Murchie, J. W. Scovil, J. C. McLeod, H. M. Webber, H. M. Grimmer, W. A. Dinsmore, A. M. Budd, P. F. McKenna, G. H. Budd, A. A. Laflin, F. D. J. Graham, W. H. Keys, M. N. Cockburn, R. W. Grimmer, J. W. Smith, G. W. Ganong, Saml. Scott, Jas. Marraty, R. W. Whitlock, B. M. Hill, M. W. McCormack, L. B. Mitchell, W. C. Arnold, W. R. Simpson, E. W. Ward, H. E. Hill, Hugh Love, Thos. Toal, Edwell Emerson, J. E. C. McAlister, F. Littlofield, D. Johnson, Levi Stewart, J. W. Fraser W. S. Poole.

The meeting was then closed and the directors went into session.

Your Maple Grove Is the Most Profitable Part of Your Farm

No matter what crops you raise one single acre of maple trees, will give you a bigger profit with less work, less time and at less expense than an acre of any other crop on your farm.

An acre of oats returns only about $20, and you must plough, fertilize, harrow, drill the seed, reap, thresh and pay for seed, besides your time, horses, help and expensive machinery. Your profit is about $5.00. An acre containing 100 maple trees will return about $30, in syrup and sugar, and the cost is only about $10, with your time at a season of the year when you can not do anything else.

We will show you how to do it, supply you with the proper equipment and let you pay cash for it or pay in two or three yearly payments.

Write us today for the fullest information and do not longer neglect the present high prices for maple products.

Grimm Manufacturing Co., Limited
45 Wellington Street, Montreal

We are not advertising PIG-TROUGHS in this issue of the welcome "FARMER" with the expectation of delivering a great many of our Troughs at this season. But we do EXPECT that many a thoughtful farmer will now, or before winter is very far advanced, enquire of us concerning the

Cast Iron Pig Troughs

we make, so that when Spring returns he will have ascertained the immense advantage of these over home-made wooden ones and will have ensured getting his supply when required by ORDERING EARLY.

Besides these we manufacture Feed-Boilers, Turnip-Pulpers, Grain-Boxes, Cheap but Serviceable Stoves, Griddles, Frying-Pans, Pots, Etc.

Enquiry and inspection carry no obligation. You'll possibly be in the Provincial Capital during the winter sometime. CALL.

The Smith Founday Company, Ltd.
Fredericton, N. B.

LOOK!! $3,300.00 IN CASH

Has been GIVEN AWAY to the Public by the Publishers of this advertisement to advertise their goods. $200.00 more IN CASH and numbers of other valuable articles will be given away at an early date.

1st Prize, $50.00 in Cash. 2nd Prize, $40.00 in Cash
3rd Prize, $35.00 in Cash. 4th Prize, $25.00 in Cash.
5th to 9th Prizes— Each $10.00 in Cash.

Herewith will be found the picture of a Chinaman washing clothes. About his person and the washtub are concealed the faces of his seven daughters Can you find them? Try—you may win a cash prize by doing so. Many have done this as will be shown by the names and addresses we will send you. If you find the faces, mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them."

Write these nine words plainly and neatly, as in case of ties, both writing and neatness will be considered factors in this contest.

This may take up a little of your time but as there are TWO HUNDRED DOLLARS in cash and many merchandise prizes given away, it is worth your time to take a little trouble over this matter.

Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words "I have found all the faces and marked them."

We Do Not Ask You to Spend One Cent of Your Money to Enter This Contest

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Three Thousand Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.

This competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company. Their decisions must be accepted as final.

Upon receipt of your reply we will send a complete list of the names and addresses of persons who have won $3,300 in Cash Prizes in recent contests held by the publishers of this advertisement. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else. Never Venture, Never Win.

Send Your Reply Direct to
GOOD HOPE MANUFACTURING COMPANY
31 LATOUR ST. MONTREAL, CAN.

F. M. Murchie, the esteemed president of the society since its organization, was re-elected, though he asked that another be chosen. The other officers elected were: Henry E. Hill, 1st v. p.; M. N. Cockburn, 2nd v. p;. R. W. Grimmer, 3rd v. p.; W. A. Dinsmore, 4th v. p.; David Johnson, 5th v. p.; W. S. Stevens, secretary; R. W. Whitlock, treasurer.

E. W. Ward, chairman of a committee that had been appointed to report on the best means to be adopted to secure increased grounds for the society, reported recommending that the society purchase from H. E. Hill and the other owners, the lot at the rear of the present fair grounds and to the south of the trotting park. This land includes about three acres, or more than double the size of the present fair grounds, and the price fixed was $350.00, the land having been cleared at a cost of $175.00. It was ordered that the offer be accepted and the proper officers were directed to complete the purchase.

This will insure greatly enlarged fair grounds and some very marked improvements before the next annual exhibition in September, 1917.

For the track committees, R. W. Whitlock reported, recommending an enlargement of the present grand stand at the trotting park and the committee was instructed to carry out the plans as presented. This will provide about as many more seats as are in the present stand and with comfortable backs. Hereafter, seats will be sold by numbered checks, the same as in a theatre and will be on sale "down town" well in advance of the races, an improvement that will be appreciated.

Other contemplated improvements will be decided upon at future meetings of the directors.

FREDERICTON AGRICULTURAL SOCIETY

The annual meeting of the Fredericton Agricultural Society, No. 34, was held recently, there being a fairly good attendance. The financial statement submitted to the meeting by the treasurer, Mr. C. Fred Chestnut, showed a balance for the year's operations of $1,587.80.

For the first time since the organization of the society the application for membership has been made by the ladies. During the past few days, five members of the Women's Institute in Fredericton applied for membership in the society and their applications have been accepted. Hereafter it is altogether likely that the women's department at the Fredericton Exhibition will be handed over to a committee of lady members of the society.

The election of the directors for the coming year was held yesterday the result being as follows: John A. Campbell, C. H. Thomas, G. Y. Dibblee, C. Fred Chestnut, William McKay. W. E. Farrell, A. C. Fleming, A. D. Thomas, F. L. Cooper, W. W. Hubbard, J. Stewart Neill, W. H. Moore, Moses Mitchell, Peter Farrell, J. Fred Ryan. Mr. R. H. Simonds was appointed auditor, this position having become vacant with the death of J. D. McKay.

MARKETS

HALIFAX PRICES

ST. JOHN

Flour and oatmeal are still high in price despite the fluctuations of the former. Hard wheat patents, $11.50; choice patents, $10.55; Oatmeal, $8.50; Cornmeal, $2.50.

American Clean Pork, $40.00 to $41.00; Mess backs, $39.00; plate beef, $30.00 to $32.00; pure leaf lard, 21½c; Compound lard, 17 cents.

Cheese, .25c to .26c; butter, .36c to .38c. Eggs .38c to .40c. Eggs strictly fresh are rising above .50c at retail.

Potatoes—$2.00 to $2.50 per barrel, which is quite a drop from the prices of a few weeks ago.

PRINCE EDWARD ISLAND PRODUCE IN HALIFAX MARKETS

At the time of writing there are very few Island potatoes offering, but such sales as have been made recently have been at the rate of $1.00 a bushel. Not more than half a dozen cargoes have come to this market this fall and it is not thought that there will be many more. A few captains who are at Island ports waiting for cargoes are a bit nervous on account of the cold weather and the prospect that winter may shut down suddenly and freeze them in. They want to get away as quickly as possible, but are having some difficulty in getting cargoes, as on account of the cold snap deliveries have largely stopped. One captain reports to his principal in Halifax that some quantities of potatoes were still in the ground and other quantities still in piles in the fields when the cold wave struck in, and that there will be considerable loss from this source. Considerable quantities of potatoes shipped by rail were caught in the cold snap, but most shippers we think sold f.o.b. either at the Island or point of rail shipment, so that the loss would fall on the buyers in most cases, who were chiefly Montreal and Toronto dealers. One Halifax handler of Island produce estimates that 50 p.c. or more of the Island's crop has been cleaned up and because of this the price is likely to continue firm. The extraordinary demand from the West and from the States has been the feature of this trade this year and has been responsible for putting the price up so high; otherwise, with so large a crop the local market would not be where it is. The latest report we have is that potatoes are being put into vessels at 65c. per bushel, which would make the cost delivered Halifax say about 85 cents, so that allowing for carrying costs it does not seem possible for the price locally to get much below a dollar a bushel. Apparently we shall have to depend upon what vessel cargoes come along before the harbors freeze over, for the railway is so congested with general business that it is not taking any more potato freights.

Oats have been selling in car lots at about 74c. but the impression of the trade is that the market will ease off.

Turnips have bten selling at 45 to 50c., though we understand there are none here at the moment. This is a very high price compared with former standards. From time immemoral up until the last year or two turnips always sold in this market in the fall at 25 cents a bushel, but apparently that is a thing of the past.—Maritime Merchant, Nov. 30th.

More Profit on Hogs

Here is an actual case taken from letters in our office. A farmer had two hogs, one he fed on Harab Digestive Tankage, the other on an ordinary grain feed. When ready for market the one fed on Harab Digestive Tankage weighed 30 pounds more than the other and sold for $3.80 more. Its feed cost $1.10. His net extra profit $2.70. Harab Digestive Tankage is guaranteed to contain 60 per cent. protein 14 per cent. bone phosphate of lime and 8 per cent fat—the best flesh bone and fat producers.

Harab
Digestive Tankage

is sold by nearly all feed dealers. If your dealer does not stock it and will not supply you, we will send freight paid to your station a 125 pound sack, with directions for feed, for $3.95—500 pounds for $15.00 offered for New Brunswick and Nova Scotia
Please name your feed dealer when ordering.

TELEGRAPHIC REPORTS

The November 28th telegraphic report of the Fruit Branch, Department of Agriculture reports as follows:—

Quebec—Potatoes still same price, but market strong.

Montreal—Potatoes, slow sale, $2.00 to $2.25 per 90 lb. bag. Quantity of potatoes and apples frosted unusually large for this date.

Toronto—Potatoes, New Brunswick Delawares, $2.25; British Columbia and Westerns $1.10 per 90 lb. sack.

Winnipeg—Demand for apples slow.

Saskatoon—Potatoes, .75c per bu. No apples in either Common or Cold Storage.

Moosejaw—Demand for apples slow.

Edmonton—Local potatoes, .65c per bu.

Calgary—Potatoes, Albertas, $28 per ton.

British Columbia potatoes $40.00.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or the companionship of your husband, just how you suffer, I long for the free trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without a day's inconvenience. Men cannot understand women's sufferings, what we women know from experience, we know better than any doctor, and thousands have proved there is hope even for the **hopeless in my method of home treatment.** If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly **or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete ten days' treatment entirely free and **postpaid,** to prove to yourself that these ailments can be easily and surely overcome in your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home **treatment, and when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all.—**young or old.** To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** entitled to you needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day,** as you may not see this offer again. Address:

APPLES IN SMALL PACKAGES

Several eastern apple growers were very successful last winter in marketing apples in small or family packages. Some sold direct to the consumer, while others sold to retail stores and fruiterers or consigned to commission dealers. One grower put practically his entire crop in half-bushel peach baskets which were handled by a commission dealer. He used 3500 baskets which sold at 75 cents to $1 each. The results in each instance were generally profitable and satisfactory.

Several styles, types and sizes of packages were employed. Some used cartons holding 12 or 15 apples in individual compartments, like egg boxes. One big grower used a similar type of box holding either 50 or 100 fruits. These are made with compartments of four sizes and are especially adapted to supply fruiterers with fancy apples, peaches, etc. Apples were shipped successfully in them from Massachusetts to California.

A popular family package is one holding a peck of fruit. A western Massachusetts grower used many of them and sold them at 50 cents direct to retailers who got 65 cents for the same. He supplied them daily as needed, making deliveries each morning and taking orders to be packed and filled the next day. In this way there was no shrinkage or loss for the retailer to stand.

Not many growers are situated to market their fruit in this way, but where they are near enough to a good market to make two deliveries a week and have a large percentage of fancy fruit, it is worth trying. The additional returns are not, however, all profit, for it takes considerable more time and labor to sort and pack fruit in small packages than in baskets or barrels.

COMING EVENTS

Maritime Poultry Show, Moncton, N. B., December 12, 13, 14 and 15, 1916.

Annual Meeting and Dairy Exhibition. Nova Scotia.

Dairymen's Association N. S. A. C., Truro, Jan. 4 and 4, 1917.

Senator Dunlap, Sample, Warfield, Wm. Belt, Arnout, Valeria, Desdemona, Ophelia, Portia, Glen Mary, Buster, Haverland, Kellogg's Prize, Paul Jones, Progressive, Superb.

Our new Catalogue and Price List will be ready about the first of the year, and will be sent free to all our old friends and any new ones that are interested in berry growing. The new fall bearer, Progressive, is a great addition to the strawberry world. Be sure and include them in your order for 1917.

CYRUS & MANNING ELLS
Port Williams, N. S.

Fir Shade Farm Dual-Purpose Shorthorns !

Several years ago I imported from Ontario three Dual-Purpose Shorthorn animals, and now have in my stable at Rothesay eight representatives of this breed. Two of the females are entered in the Record of Performance, and so far have done excellent work. If you feel disposed you might drop in and see these the first time you are in the vicinity. Perhaps some time when you are coming to the city you would let me know, when I could arrange to go to Rothesay with you.

P. R. L. FAIRWEATHER. St. John, N. B.

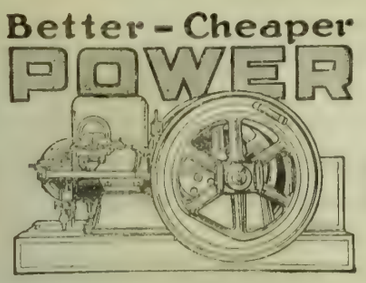
OPPORTUNITY

Owing to not getting a new poultry house built as expected, we are forced to sell about 50 pullets in Barred Rocks and White Leghorns. Also a few more yearling hens and several choice Cockerels.

If interested write,

ORCHARD HILL FARM,
Brown's Flats, N. B.

USES EITHER GASOLINE OR KEROSENE



HERE is news of an engine far in advance of anything else ever offered. It uses either gasolene or kerosene and it has all the features that have made the Page Gasolene Engine so pre-eminently successful. This new engine runs perfectly on gasolene but it is specially designed for running on the cheaper fuel—kerosene oil.

There is nothing complicated about this engine; it is easy to start and is guaranteed to be as satisfactory as the old style Page Engine—the smoothest and most dependable of all farm engines.

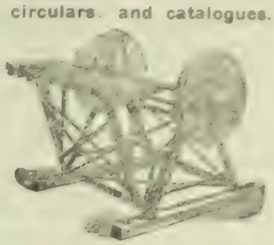
You will find a Page Engine to suit your power requirements—note the prices.

1½ H.P. "Make & Break" Gasolene.....$45.00
1¾ H.P. "Make & Break" Gasolene.....50.00
5 H.P. "Make & Break" with Ignitor Kerosene and Gasolene.....$145.00
1½ H.P. with pump Jack attachment Gasolene $48.00
3 H.P. "Make & Break" with Ignitor Kerosene and Gasolene.....$89.00
7 H.P. "Bake & Break" with Ignitor Kerosene and Gasolene.....$190.00

Trucks $8.00 to $10.50 extra. Freight paid to your station.

Write us for special circulars and catalogues.

IT'S A FINE STRONG FRAME.



That's what one of our customers says about the Page Wood Sawing Machine, and that's why it is a favorite with farmers everywhere. It's built to last, but what's just as essential it is most convenient. The interchangeable pulley and balance wheel—the Tilting Table with roller at one end to facilitate the handling of long poles are desirable features.

We make it in big enough quantities to get the price way down:

NO I. Wood Saw Frame—3 ft. 6 in. between blade and wheel $24.00
NO. 2. Wood Saw Frame—4 ft. 2 in. between blade and wheel $27.00
NO. 3. Pole Saw Frame suitable for poles of any length as wheel is below frame.....$35.00

BLADES OF COURSE ARE EXTRA AS FOLLOWS:—

20 in.....$3.60
22 in.....$4.25
24 in.....$4.90
26 in.....$5.75
28 in.....$6.65
30 in.....$7.50
32 in.....$8.75

PAGE PAINTS

Many of our customers have been taking advantage of our low prices in paints. We are large consumers of paint and are prepared to give you the advantage of our paint experience. We can give you the highest grade of House Paint with our usual guarantee at $1.80 per gallon—Barn Paint at $1.40 per gallon. Color card and price list on application.

MOTOR SPIRITS, KEROSENE AND GASOLENE.

Page Motor Spirits, kerosene and gasolene are in great demand for we keep the quality up and the prices down. Write for price list.

PAGE GRINDERS

have stood the test of hard experience. They are thoroughly reliable and at attractive prices:

Baby Grinder.....5½ inch plates 12.50
Page Grinder.....8 inch plates 30.00
Page Grinder.....10 inch plates 35.00

Freight Paid.

Write for our big general Catalogue—it contains a full list of the many things we have for the farm—and on all of them we quote you money saving prices.

THE PAGE WIRE FENCE COMPANY, Limited, 45 Dock Street, ST. JOHN, - - N. B.

Preparedness for Now and After the War

THE KEY NOTE OF THE

SHORT COURSES

AT THE

College of Agriculture, Truro, N.S.

FREE to ALL students of the Maritime Provinces—

Farmers, Farmers' Sons, Wives and Daughters—

No age limit, from sixteen to over seventy. Equal Privileges for both sexes.

FROM

Jan. 2 to 11

YEAR 1917

Over 250 students attended last year. Additional attractions should bring more in 1917. The extra special attraction will be the series of lectures and demonstrations, during the first week, by Dr. C. A. Zavitz of Guelph, America's greatest crop expert.

MEN'S SHORT COURSE

Instruction in all branches of Animal and Field Husbandry, Farm Management, Veterinary Science and Allied Agricultural Sciences. The College staff will be assisted by leading experts from the Maritime Provinces and Ontario. Included will be representatives of the Dominion Dept. of Agriculture and the New Brunswick and P. E. Island Departments as well.

COURSE FOR WOMEN

Instruction and demonstrations in Dairying, Poultry Husbandry, Gardening and Domestic Science. Given in the beautiful and spacious class rooms for Women in the new Science Hall.

This course will be extended into a six weeks course if there is sufficient demand.

For particulars write to

M. CUMMING, B. A., B. S. A.,
Principal of College of Agriculture,
TRURO, N. S.

Unique opportunity for the busy farmer to get in touch with agricultural education in the shortest possible time.

Special excursion rates on all Maritime Province Railways and on the Boats from Prince Edward Island.

BRITAIN'S FORESIGHT SAVES WORLD FROM BIG INCREASE IN THE PRICE OF RUBBER PRODUCTS

The beneficial results accruing to the sagacity and farsightedness of the British Government in its promotion of the rubber industry and its subsequent "friendly" cornering of the crude rubber market are just now making themselves manifest in the manufacturing end of the industry. With other staple products soaring in price, and the consumer faced on every side with the augmented cost of raw materials, it is gratifying to know that one article of common use, at least, is not only not increasing in price, but has decreased even under the extreme pressure of war orders.

When Great Britain began the fostering and financing of rubber plantations in 1893, the rubber world did not stand aghast, but smiled cynically. South America—Brazil, to be exact—was then producing practically all of the world's supply, and the rubber, crude indeed, that was coming from the wild trees of that country, was considered quite enough. Great Britain foresaw conditions, however, and aided the establishing of plantations in her tropical colonies, with the result that when the motor industry and affiliated and allied manufactories demanded an increased supply Great Britain was there with the product.

Today South America is producing about the same quantity of crude rubber and it constitutes only 23 per cent of the world's supply. While the United States uses about 50 per cent of the rubber of the world, over 75 per cent of the crude rubber is marketed and controlled by Great Britain.

In 1910 the demand for rubber began to increase materially. The world's production, both wild and plantation, for that year was 70,500 tons, and the cost three dollars a pound. The estimated crude rubber to be used in 1916, based on previous years, will be approximately 202,000 tons, put to varied uses, yet the price is now between 60 and 70 cents a pound—just about half what it was at the beginning of the war.

Such conditions are in a measure a godsend to the consumer—to the man who walks and wears rubbers and overshoes; as well as to the man who ues the rubber for his motor car tires. And the rubber-wearing individual can thank the British Government for this. While Britain has just given a single order for 2,000,000 pairs of hig length rubber boots for her soldiers, taking 14,000,000 pounds of rubber, and other materials, still the price is kept down by that mysterious force known as "government control."

In the meantime that other staple—leather—has increased in price since the war started, until today a single cow hide is worth as much as was paid for the whole cow a few years ago. This is due in a large measure to the quantities of leather used for the army, the cutting-off of the European supply, which came largely from Russia, and other quickly recognized factors, including the fact that there is no "government control" concerned.

With leather up and rubber down it is naturally following that rubber is fact becoming a substitute for leather. With winter and the slushy weather setting in the man in moderate circumstances finds an opportunity to save the costly leather of his boots—so quickly ruined by water, and particularly snow water—by wearing rubbers and overshoes, that, thanks to the British Government, cost little or no more than formerly.

Whatever increase there may be in the cost of rubber goods, slight as it is, is due solely to the chemicals and fabrics which enter into the manufacture and also the higher prices paid to labor. So it would appear that this winter—thanks to Britain's foresight—the patriotic man will wear humble goloshes to save the costly leather of his shoes.

CANADA

NATIONAL SERVICE

PUBLIC NOTICE is hereby given under the authority of the "War Measures Act, 1914," that during the first week in January, 1917, an inventory will be made by the Post Office Authorities, of every male between the ages of sixteen and sixty-five, residing in Canada.

National Service Cards and addressed envelopes for their return to Ottawa have been placed in the hands of all Postmasters for distribution amongst the persons required to fill in such cards. Every male person of the prescribed ages is required to fill in and return a card enclosed in an envelope within ten days of its receipt.

Any person who fails to receive a card and envelope may obtain the same upon application to the nearest Postmaster.

R. B. BENNETT,
Director General.

Ottawa, 15th December, 1916.

THE NATIONAL SERVICE CARD

1. What is your full name?..... 2. How old are you?.....years.

3. Where do you live? Province.....
4. Name of city, town, village or Post Office .....
   Street..... Number.....
5. In what country were you born? - - .....
6. In what country was your father born? .....
7. In what country was your mother born? .....
8. Were you born a British subject?.....
9. If not, are you naturalized?.....
10. How much time have you lost in last 12 months from sickness? .....
11. Have you full use of your arms?.....
12. Of your legs?..... 13. Of your sight?.....
14. Of your hearing?.....
15. Which are you—married, single or a widower? - .....
16. How many persons besides yourself do you support? .....
17. What are you working at for a living?.....
18. Whom do you work for?.....
19. Have you a trade or profession?..... 20. If so, what?.....
21. Are you working now?..... 22. If not, why?.....
23. Would you be willing to change your present work for other necessary work at the same pay during the war?.....
24. Are you willing, if your railway fare is paid, to leave where you now live, and go to some other place in Canada to do such work?.....

GOD SAVE THE KING

MARKETING EGGS THE RIGHT WAY

When the pullets begin to lay during the fall, small eggs are abundant. In order to secure the best results upon the egg market the eggs must be graded carefully on the farm, placing the small eggs in separate crates or in certain definite layers if only individual crates are to be shipped. Each crate is labeled according to its contents. If the grading is done carefully and honestly, and the package marked according to contents, a satisfactory price will usually be received for the large eggs and a fair price for the smaller ones. In no case should brown and white eggs be marketed in the same tray. If the shipment is so small that only one case is to be marketed, the brown eggs should be put together and the white ones together and the grades so marketed.

Wholesale egg buyers also report a loss to shippers from carlessness in handling the crates. Failure to use well-nailed crates, new fillers and a cushion at top and bottom are three factors which cause much loss. Before packing the eggs the crate needs to be carefully looked over and renailed where necessary. The bottom of the crate is cushioned before packing the first layer of eggs, a thin layer of eggs, a thin layer of excelsior being evenly distributed. Only new substantial fillers which have not lost their rigidity and are strong should be used. When the crate is filled with eggs the top is cushioned with excelsion or newspapers and the cover is nailed securely on each end, but not in the middle.

Patriotism---Not Production, Needed.

An Important Open Letter

To The Minister of Militia,
Hon. A. E. Kemp, Ottawa.
Dear Sir,

Two years ago last August, The Maritime Farmer fired the first shot of what was later designated a "Patriotism and Production" campaign.

The Maritime Farmer pointed out to its readers the need for tilling every available acre in the Maritime Provinces.

It suggested that Great Britain, before the close of the present war, would require every pound of farm produce that could be raised.

The appeal directed the attention of farmers to the probability that the crop of 1915 would be used to feed the men who planted it, in 1916, not in their native land but in the trenches of France and Flanders.

You know, Sir, the truth of that prophesy.

Well, the farmers of the Maritime Provinces responded in 1915 with a crop that proved a record breaker. They did their share to increase production.

Later these same farmers saw their sons leave the farm to fight for Canada. They have gone from the farms of eastern Canada, whole families of them, two, three, four or more and fathers and mothers, dry eyed and stout hearted have faced the farm problem.

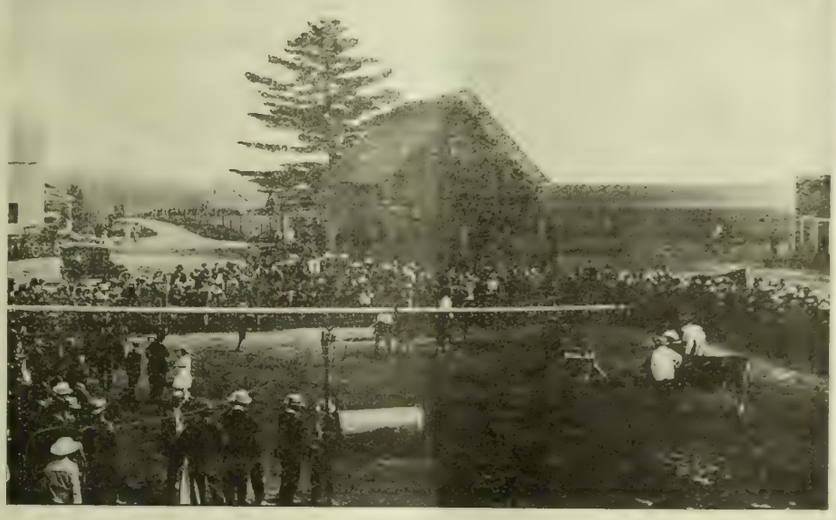
Many farm homes in these parts, Sir, have been saddened by the deaths of their all. Only sons, and in some cases, all the sons of parents have died heroically in defence of their native land.

Unwisely, the Maritime Farmer believes, farm owners, in many cases, have abandoned their holdings to go to the front and do "their bit',, leaving weeds to flourish, where life giving crops once prevailed.

The Maritime Farmer was only one of all the farm papers in Canada to support, "Patriotism and Production". Freely and cheerfully has the farm press of Canada advocated larger yields, and as we have intimated the response has been generous.

Yet, there is in the land a cry against high cost of living and an agitation against farmers, accused of holding stocks. An unjust accusation prevails, we submit, so far as it is directed against those who have denuded their farms of man power, in order that the Canadian forces might be strengthened.

You can't have production if you can't get men. You can't have men on the farm if your sons lie buried on the battlefields of Europe.



FARMERS' EXCURSION TO EXPERIMENTAL STATION, FREDERICTON.
A number of the visitors are here listening to a live stock address and demonstration by Prof. E. S. Archibald, Dominion Animal Husbandman.

And to what does this all lead? To the consideration of conditions in Halifax, the military centre of Canada, which are a disgrace to this country and a outrage on the feelings of the farmers who have made such heroic sacrifices in this war.

You, Sir, have just assumed office. You are one of the leading business men of Canada. You are not afflicted with the "military bug" as they have it in Halifax. You are not a victim of red tape, nor a man unable to appreciate real merit and estimate real manhood.

The Maritime Farmer would therefor direct your attention to matters which are subjects of common street gossip in the Maritime Provinces and matters of such weighty import to Canada, that we believe you will probably rectify them with as little delay as possible.

For two years the Halifax garrison has been officered by men who have, in some cases, been receiving military training for over twenty years, at the expense of this country.

The public is convinced that many of these officers have not even offered for overseas service, and the Maritime Farmer has been informed that some of them have even refused to go when overseas positions have been offered them.

The public believes that men recruited from the farms of this country, where they are so badly needed at this time, are being used by these same officers as "flunkies."

That is to say, these men who have enlisted to the detriment of the farm industry are required to drive cars, shovel snow, mow lawns and perform other menial duties for men whose courage is very gravely questioned, whether fairly or unfairly, the Maritime Farmer cannot say. But the fact is there and the public are imputing to these officers motives which suggest that the public is tired of the whole show.

The public has convinced itself that in these times when men from the farms of Canada are dying by scores, that the garrison of Halifax could be better employed in the avocations they left. particularly if farm trained, than in dancing attendance on these home defence officers in Halifax.

The public is convinced that many of these officers, who are

engaged in business in Halifax city, are not only receiving pay from the department of which you are the head, but that they are devoting at least a portion of the time for which they are paid, to their own private business interests. In other words, it is common gossip, that some of these officers, are grafting at a time when graft should not be tolerated in this land.

The public also believes that there are in the city of Halifax ministers of the gospel, who, while drawing salaries from their churches, are also receiving pay from your department. In a word, the public is convinced, that there is in Halifax a reign of pure, unadulterated graft, which should bring the blush of shame to the faces of those participating in it.

And there is another feature of the situation to which we would direct your attention, Sir.

There has arrived, are arriving and will arrive in Canada for some time, scores of officers, who have suffered on the field of battle. Many of these men, Sir, are unable to secure positions, commensurate with the sacrifices they have made. Many of them are on C. E. F. pay, while these Halifax officers have been holding sinecures for two years.

The Maritime Farmer would suggest to you that the officers of the Halifax garrison be displaced and their duties given to men from the firing line. It is more than a suggestion of this paper, it is a demand by the fathers and mothers of the men at the front, that honor be bestowed where honor is due.

When Canada asked men to enlist, she promised them the best she had, when they returned to their native land. Your department, Sir, has not carried out these promises, but the Maritime Farmer looks to you to remedy this defect.

Canada asked for "Patriotism and Production". The farmers of Canada have answered by placing both at your disposal. The farmers, in turn, ask that you insist upon some measure of patriotism in connection with the administration of the garrison at Halifax. No officer should be engaged there, who is not willing to go overseas, or who has not been there.

Men from the front should have the positions that are offering there. Rankers, coming from the battlefields. claim that they do not get sympathy from those who have not seen action. There is in the public estimate nothing in common between a man who has not been willing to enlist for overseas and a man who has been there. We think, Sir, you will appreciate the men's point of view.

In conclusion, let us say, that if you follow this suggestion, you will do more to stimulate recruiting than by following any other course open to you. Halifax is a glaring, blinding notification to the young of Canada, "All hope abandon, ye who have fought and bled."

An end to it, please, Mr. Minister of Militia. It will be to commence your administration with an act that red tape supports; the end of a system which all decent men and women abhor; the performance of a simple act of justice to men from the front; and the redemption of a sacred promise of Canada to her real soldier boys.

Frost Injury--Different Ways in Which Apple Trees are Affected

During the past twenty-seven years much experience has been had at Ottawa with frost injury to fruit trees, and the observations which have been made during that time and the conclusions drawn and recommendations made are now summarized, in the hope that much injury will be prevented by adopting the best methods. It would appear that there are at least eleven distinct forms of winter injury.

If one could make an accurate estimate of the number of fruit trees which have been winter killed in the colder parts of the different provinces of Canada the figures would be astounding; trees that were killed just when they were beginning to bear fruit; and trees which were in their prime and bearing bountiful crops, all have suffered. This terrible destruction from winter has caused great discouragement among the people and has been one of the chief causes of the slow development of the fruit industry in the colder parts of Canada.

Much of this loss could have been avoided if the hardiest trees only had been planted, but how few there are who knows the details connected with the establishment and maintenance of an orchard and who know there is almost or quite as much difference in the hardiness of varieties of fruits as there is between the hardiness of the tenderer and the hardier of vegetables. All farmers have learned by observation that with a very slight frost potato crops will be killed, but that it will take a much lower temperature to kill a cabbage. But the cause of death in fruit trees still continues to be a very mysterious thing to most farmers who, when a tree has been root killed, for instance. sees it leaf out and bloom but eventually wilt under his very eyes during the summer without any apparent reason. Unfortunately this lack of knowledge on the part of the farmer has been taken advantage of by unscrupulous men and farmers have been urged to buy the varieties of fruits which appeal to them most strongly in the coloured plate or from the glowing description given by the agent. Of late years our best nurserymen seem to be impressing upon their agents the importance of offering only those varieties suited to the district in which they are sold and we have been very pleased to have these agents call at the Experimental Farms and get what information could be given them on the fruits most suited for the districts they were working in. For a long time it was not known what varieties of fruit were hardy in the different parts of Canada, but experience has taught which will succeed and the results of this experience have been recorded. With the literature now available and the information which may be obtained by applying to the proper authorities, there is no reason why any one should plant varieties which will not succeed with him, provided he has the proper soil in which to grow them and gets good trees and looks after them properly.

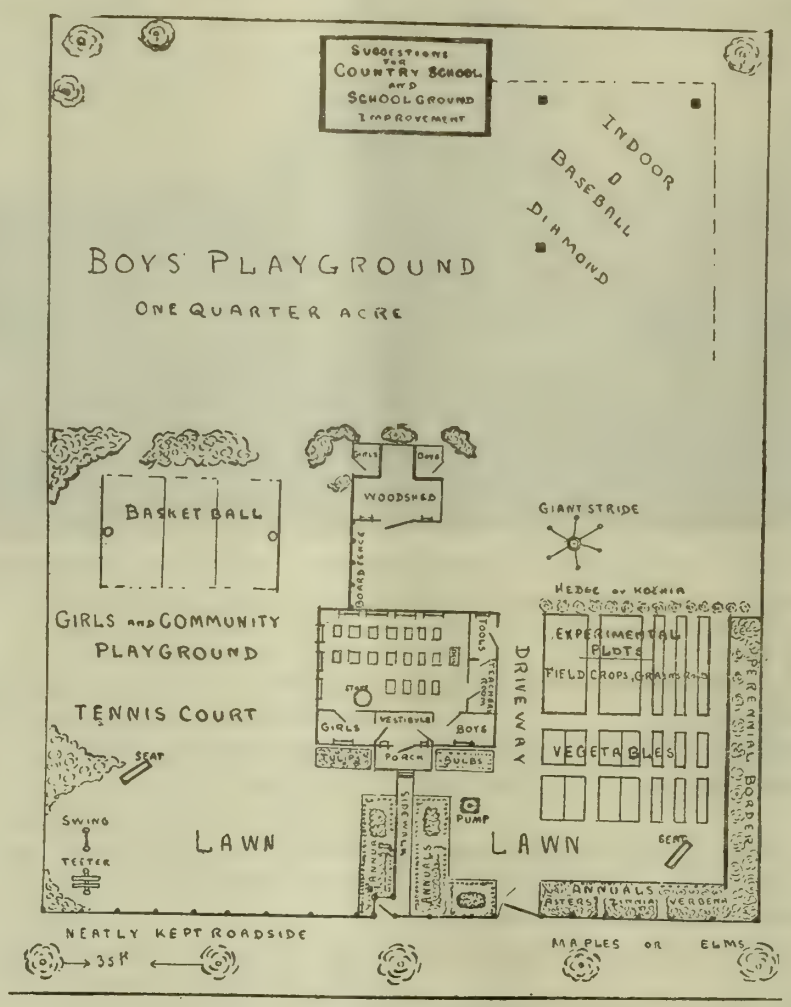


Diagram of West Royalty School, P. E. I.

The forms of frost injury which will be discussed here are, root-killing, bark-splitting, trunk-splitting, sunscald, trunk or body injury, crotch injury, killing-back, black-heart, discoloration of sap wood, killing of dormant buds, killing of swollen buds.

Root-killing.—Root-killing is caused by the exposure of roots to severe frost and by the alternate thawing and freezing of the roots. It is most prevalent in winters when the soil is dry and when there is little or no snow. Roots are in many cases tenderer than the tops and are sometimes killed when the tops remain uninjured. It is sometimes desirable to have trees on their own roots as these may be hardier than the stock. Some valuable experiments were conducted by the Nebraska Agricultural Experiment Station to determine the conditions under which root-killing occurred. Trees were planted in boxes 2 feet square and 18 inches deep, each box having 25 young apple trees. Six boxes were left outside about the middle of December with soil having different percentages of moisture. One box was covered with a mulch of straw about 4 inches deep. One was kept covered with about 4 inches of snow whenever snow fell. The remaining boxes were left without any covering, and snow which fell being swept off. The trees were examined in February when out of 25 apple trees set in the unprotected box containing 10.4 per cent of moisture the roots of 20 trees were dead and the remainig 5 uninjured. In the unprotected box containing 15.2 per cent of moisture, 19 trees were dead and 6 injured. In the box with a moisture content of 19.8 per cent, 3 were dead, 10 injured, and 12 uninjured. In a box with 25.6 per cent moisture, 8 trees were dead, 4 injured, and 13 uninjured. The box covered with the straw mulch contained 16 per cent of soil moisture and none of the trees were dead in this box, and but 7 injured. In the box covered occasionally with snow and containing 15.8 per cent moisture 7 were dead and 8 injured. Not a root was injured in a box stored in a cool, dry eave, though it contained but 10 per cent soil moisture. These figures are very striking. The fact that the trees kept in a cool, dry cave were uninjured was believed by the experimenters to prove that cold as well as dryness was necessary to cause the death of the roots, which is borne out by our own experience. The fact that the injury was found to be so great in the dry soil would appear to show that the dry, cold air entering the soil killed the roots and that in the soils which were moist even thawing and freezing would not destroy them. It is possible that the lower temperature of the dry soil had much to do with the killing. As the soil in some parts, and provinces, of Canada is usually moist in the autumn and further drying out is usually prevented by a covering of snow, root-killing does not often occur, there having only been four times during the past twenty years when there has been much injury. This infrequency of root-killing is, however, liable to make fruit growers careless, and a time comes when an orchard is just in its prime when the trees are swept out by root-killing to the owner's great disappointment and discouragement. What, then, are the preventives of root-killing

At the Central Experimental Farm, Ottawa, many trees were root-killed in the winter of 1895-6, a winter when there was little snow. At that time cover crops were not used to any extent and the soil at the farm was bare. Since that time great care has been taken to have a cover crop in the orchard before winter sets in. This cover crop in itself protects the roots of the trees and helps to hold the snow

(Continued on page 148)

The Maritime Poultry Show

War time conditions are affecting practically every industry in Canada. Situated, as we are in the Maritime Provinces, close to the sea boards, translantic trade routes starting points, practically every available building of fairly large dimensions is in the service of the military authorities for the quartering of troops held in readiness for quick transit across to the battle fields of Europe.

The commodious Winter Fair Building in Amherst, N. S., is one of a number thus used. Consequently the Annual Horse Show and the Maritime Winter Fair of 1916 were both cancelled. This is not to the best interests of our live stock industry.

One of the big centres of attraction at the Maritime Winter Fairs was the poultry department where birds from the three provinces met in annual competition under the auspices of the Maritime Poultry Association and the Maritime Stock Breeders' Association.

ST. HILARE CREAMERY, MADAWASKA CO., N. B.

This Creamery is at present being operated by the Federal Dairy Division as a Demonstration Creamery.

In the City of Moncton each year enthusiastic poultry men were wont to hold a poultry show, where birds from various sections of the province were brought into competition. The show was usually quite successful, and as a commodious space for show purposes was available in one of the Record Foundry's large warehouses, the Maritime Stock Breeders' Association decided to hold their big poultry show in Moncton.

A prize list, similar to the prize list of former shows was prepared, and the poultry men responded with a creditalbe number of entries in practically every section with the exception of the dressed poultry class, where only a very small number of entries of rather inferior qual'ty was shown.

In fact no red ribbons were awarded in the class, a blue or second prize ribbon being considered enough or more than enough for the best specimens displayed. In other years the display of dressed poultry was of such dimensions that some of the largest buyers in Montreal thought it worth while to send representatives of their respective firms to buy the entire lot. The enthusiasm of the ladies in the vicinity of Amherst and Maccan and other sections in Cumberland County was sadly missed in this year's dressed poultry show.

George Robinson of Ottawa placed the awards in the open classes and Messrs. Seth Jones and J. P. Laundry placed the ribbons in the Utility Class.

The birds throughout the whole show were in excellent feather, in vigorous condition and had been carefully bred and selected, and best of all there seemed to be a large percentage of workers among the cooped as indicated by the number of eggs daily gathere by the attendants.

White Leghorns led in point of numbers. Barred Rocks, Buff Orpingtons and White and Silver Wyandottes also made a strong showing in their respective classes. There was also a good showing of Reds, Andalusians, Dorkings, Hambugs and Games.

Following is a complete list of prize winners in the respective classes.

Open Classes

Ancona cock—1, John P. Bain.

Ancona hen—1, John P. Bain.

Ancona cockerel—1 and 2, Seaman & Stewart.

Ancona pullet—1 and 2, Seaman & Stewart.

Andalusians, cock—1 and 2, F. B. Chapman.

Andalusians, hen—1, F. B. Chapman; 2, Jas. T. Dustan, Moncton.

Andalusians, cockerel—1, Jas. T. Dustan; 2, Geo. McEchron, Moncton; 3, Geo. McEchron.

Andalusians, pullet—1, F. B. Chapman; 2 and 3, Geo. McEchron; 4 and 5, F. B. Chapman; 6, Jas. T. Dustan.

Brahama, Light, cock—1 and 2, Day Bros.

Brahama, Light, hen—1 and 2, Day Bros.

Brahama, Light, cockerel—1, Chas. H. Smyth; 2, Day Bros.

Brahama, Light, pullet—1, Day Bros.; 2, Chas. H. Smyth.

Brahama, dark, cock—1, Day Bros.

Brahama, dark, hen—1, Day Bros.

Brahama, dark, pullet—1 and 2, Day Bros.

Black Spanish White Face Cockerel—1, John P. Bain.

Black Spanish White Face Pullet—1, John P. Bain.

Buckeyes, Pullet—1 and 2, Scott & Warren.

Campines, Golden Hen—1, Louise C. Brown.

Campines, Golden Cockerel—2nd no 1st awarded—Louise C. Brown.

Campines, Golden Pullet—1, Louise C. Brown.

Campines, Silver Cock—1, Louise C. Brown.

Campines, Silver Hen—1, Louise C. Brown.

Campines, Silver Cockerel—1, W. A. Balser; 2, W. A. Balser.

Campines, Silver Pullet—1, Louise C. Brown; 2, W. A. Balser.

Cochin, Buff Cock—W. A. Balser.

Cochin, Buff Hen—1, W. A. Balser.

Cochin, Buff Cockerel—1, W. A. Balser.

Cochin Buff Pullet—1, W. A. Balser.

Cochin Partridge—1, Day Bros.

Black Orpington cock—1st and 2nd, W. S. Swetman, Moncton, N. B.

Black Orpington hen—1st, W. S. Swetman; 2nd, Mrs. C. W. Fawcett, Sussex, N. B.

Black Orpington cockerel—1, W. A. Balser, Moncton, N. B.

Black Orpington pullet—1, W. A. Balser; 2, Mrs. C. W. Fawcett.

Blue Orpington cock—1, Watson Lutz, Moncton; 2, W. A. Belser.

Blue Orpington hen—1 and 2, W. A. Belser; 3, Watson Lutz.

Blue Orpington cockerel—1, Watson Lutz; 2, W. A. Belser.

Blue Orpington pullet—1 and 2, W. A. Belser.

Barred Plymouth Rock cock—1, Thos. Lathan, Alma, N. S.; 2, Kentville Poultry Yards, Kentville; 3, Percy Carey, Yarmouth.

Barred Plymouth Rock hen—1, Percy Carey; 2, Watson Lutz; 3, Kentville Poultry Yards.

Barred Plymouth Rock cocgerel—1, Kentville Poultry Yards; 2 and 3, Watson Lutz.

Barred Plymouth Rock pullet—1, Kentville Poultry Yards; 2, Watson Lutz; 3, Percy Carey.

White Plymouth Rock cock—1, Watson Lutz; 2, C. B. Chapman, Amherst.

White Plymouth Rock hen—1, C. B. Chapman; 2, J. L. Curran, Charlottetown.

White Plymouth Rock cockerel—1, C. B. Chapman, Amherst; 2 and 3, Odbur James, Sunny Brae; 4, Watson Lutz; 5 and 6, Odbur James.

White Plymouth Rock pullet—1 and 2, Odbur James; 3, Watson Lutz.

Buff Plymouth Rock cock—1, H. D. Thompson, Stellarton.

Buff Plymouth Rock hen—1. H. D. Thompson; 2, J. G. Stockford, Moncton, N. B.

Buff Plymouth Rock cockerel—1. H. D. Thompson; 2, J. G. Stockford.

Buff Plymouth Rock pullet—1, J. G. Stockford; 2, H. D. Thompson.

Partridge Plymouth Rock cock—1, Thos. Reardon, Sussex.

Partridge Plymouth Rock hen—2. Thos. Reardon, Sussex.

Speckled Sussex cock—1, Seaman & Stewart, Moncton, N. B.

Speckled Sussex hen—1 and 2, Seaman & Stewart.

Speckled Sussex cockerel—1 and 2, Seaman & Stewart.

Speckled Sussex pullet—1 and 2, Seaman & Stewart.

White Wyandotte cock—1 and 2, Samuel Steeves; 3, Kentville Poultry Yards.

White Wyandotte hen—1, 2, 3, 4, Samuel Steeves; 5, B. J. Sutton, Glace Bay, N. S.; 6, Kentville Poultry Yards.

White Wyandotte cockerel—1, 2, 3, 4, 5, Samuel Steeves; 6, Geo. W. Brown, Fredericton.

White Wyandotte pullet.—1, 2, 3, 4, Samuel Steeves; 5, Geo. W. Brown; 6, Samuel Steeves.

Leghorns White S. C. Cock—1, Chas. Johnson, North Sydney; 2, J. N. Ferguson, Fredericton; 3 and 4, Chas. Johnson; 5, Geo. Thompson, Moncton, N. B.; 6, Odbur James.

Leghorns White S. C. hen—1, J. N. Ferguson; 2, Odbur James; 3, Chas. Johnson; 4 and 5, J. N. Ferguson; 6, Ernest Craze, Port Williams.

Leghorns White S. C. cockerel—1, 2, 3, 4, Chas. Johnson; 5, J. N. Ferguson; 6, W. J. Pickard, Charlottetown.

Leghorns White S. C. pullet—1, W. J. Pickard; 2 and 3, J. N. Ferguson; 4, 5, E. F. McKim, Amherst; 6, Odbur James.

Leghorns White R. C. cock—1, Day Bros., Moncton, N. B.; 2, Scott & Warren, St. John, N. B.

Leghorns White R. C. hen—1, Day Bros.; 2, Scott & Warren.

Leghorns White R. C. cockerel—1, Scott & Warren; 2, Walker & McMullin, Truro, N. S.

Leghorns White R. C. pullet—1, Walker & McMullin; 2, Scott & Warren.

Leghorn Brown S. C. Cock—1, R. Carter, Halifax, N. S.; 2, Scott & Warren.

Leghorns Brown S. C. hen—Scott & Warren; 2, R. Carter.

Leghorn Brown S. C. cockerel—1, 2, Scott & Warren.

Leghorn Brown S. C. pullet—1 and 2, Scott & Warren.

Leghorn Brown R. C. cock—1, Scott & Warren.

Leghorn Brown R. C. hen—1 and 2, Scott & Warren.

Leghorn Buff S. C. cock—1, Alex. Donold, Moncton, N. B.; 2, Day Bros.

Leghorn Buff S. hen—1, Alex. Donald; 2, John P. Bain, St. John, N. B.

Leghorn Buff S. C. cockerel—1 and 2, Day Bros.

Leghorn Buff pullet—1, Alex. Donald; 2, John P. Bain.

Leghorns Black, S. C. cock—1 and 2, Day Bros.

Leghorns Black, hen—1 and 2. Day Bros.

Leghorns Black, cockerel—1, Day Bros.; 2, John P. Bain; 3, Walker & McMullin.

Leghorns Black, pullet—1, Walker & McMullin; 2, John P. Bain; 3, Walker & McMullin.

Winners in Live Utility Poultry

Pair Wyandotte Cockerels—1. Samuel Steeves.

Pair Wyandotte pullets—1. Samuel Steeves; 2, Walker & McMullin.

Pair Golden Wyandotte cockerels—1, Lloyd A. Peel, Amherst, N. S.

Pair Golden Wyandotte pullets—1, Lloyd A. Peel.

Pair Silver Wyandotte cockerels—1, S. E. McKie, Moncton, N. B.

Pair Buff Wyandotte cockerels—1, F. H. Morine, Port Williams.

Pair Buff Wyandotte pullets—1. F. H. Morine.

Pair Barred Plymouth cockerels—1. Samuel Steeves; 2, Walker & McMullin; 3, Mrs. Evans Kyle, Sussex, N. B.

Pair Barred Plymouth pullets—1. Walker & McMullin; 2. Mrs. Evan Kyle; 3. Samuel Steeves.

Pair White Plymouth Rock cockerels—1, Albert Boswall, French Fort, P. E. I.; 2, Watson Lutz.

Pair White Plymouth Rock pullets—1 and 2, C. B. Chapman; 3, Watson Lutz.

Pair Buff Orpington cockerels—1 and 2, C. B. Chapman; 3. E. S. Tracey, Halifax, N. S.

Pair Buff Orpington pullets—1 and 2, C. B. Chapman; 3. E. S. Tracey.

Pair Orpingtons A. O. V. pullets—1. W. S. Swetman.

Pair Rhode Island Reds. S. C. cockerels—1. Kentville Poultry Yards.

Pair Rhode Island Reds. R. C. pullets—1. Seaman & Stewart.

Pair Brahamas. cockerels—1 and 2. Chas. H. Smyth, Moncton, N. B.; 3, Day Bros.

Pair Brahamas. pullets—1. Day Bros.

BOOST A GOOD THING

The Secretary of The Sussex & Studholm Agricultural Society, an agricultural Society that encourages its members to buy their fertilizers co-operatively by taking charge of the ordering and distribution of the goods, handed us his order file with the request that we glance over the individual orders, of which there were over sixty.

The Society's membership includes a band of prosperous dairymen who have large quantities of stable manure and consequently the various orders were for small quantities of goods, as many of these farmers only use just a little to give their crops a quick start—and depend on stable manure to do the rest.

These farmers have been buying Nitrate of Soda, Sulphate of Ammonia, Acid Phosphate, Guano, Tankage and in pre war times Muriate of Potash, and doing their own home mixing at a saving from $10.00 to $15.00 per ton. We were particularly impressed with some of the orders. One order sent in by a Mr. Jas. Small read: "Please order for me enough chemicals to make up 700 pounds to analyse the same as mixture for which I bought chemicals from you last year." We turned up Mr. Small's 1915 order and found that his order had only amounted to 400 pounds. The moral gleaned from this is clear. Mr. Small bought chemicals and did his own mixture in 1916 and was so well satisfied that he nearly doubled his order for 1917. But listen, that was not all. He ordered enough chemicals in addition to the above to make 500 pounds of another analysis for his grain—just to try it out. This man, like many more of the members of this Society, are learning about the plant food requirements of their various crops and the part each food element plays in plant growth.

As a proof that Mr. Small did not hide his light under a bushel, we observed the following wording on three or four other orders:—

"I wish to become a member of the S. & S. Agricultural Society, for which I enclose my membership fee which also includes a year's subscription to the Maritime Farmer for the ensuing year. Please order for me enough chemicals to make X Y Z pound s of same analysis as you procured for Mr. Jas. Small of this place last year. I will do my own mixing.

Mr. Small was satisfied with the saving in purchase price and with the results procured in crop yields. His neighbors also came, saw and were convinced to the extent that they too wished to share in the benefits accruing from co-operation.

When you discover a good thing in agriculture, tell your neighbors so that they too, like you, may benefit.

The Sussex & Studholm Agricultural Society co-operates with a large number of other progressive Societies in the province of New Brunswick that have clubbed together under the corporate name of New Brunswick Agricultural Societies United. Through this central body the purchase of the fertilizer requirements of the respective societies is made. The assembled orders amounts to a very respectable proportion, and the larger wholesale agencies are glad to quote their very lowest terms.

SHORT COURSES AT TRURO

We would direct the attention of all our Maritime Province readers to the advertisement appearing elsewhere in this issue of the Maritime Farmer of the Short Courses in Agriculture to be held at the College of Agriculture, Truro, Jan 2-11, 1917. These courses are free to students from all the Maritime Provinces. Instruction is provided both for old and young, and for men and women. The program is a comprehensive one that should attract the interest of everyone interested in agriculture in Nova Scotia. The key note of the course is "preparedness for now and for after the war." A booklet has been issued in which a full description of the course is given.

We publish the contents of the booklet on the following page. Peruse it carefully and make up your mind to go. If you would like to have a copy or copies of the booklet to hand to your friends, write to Principal Cumming at Truro.

DOWN WITH OLEO

The Women's Council of Peterboro, Ont., is issuing petitions to women's councils in other parts of Canada, asking that they all use their influence with the government to allow the manufacture of oleo margerine and also the sale of skimmed milk, labelled as such.

We are glad to note that the St. John Women's Council refused to support the resolution. We do not want oleo margerine on the Canadian markets. Its sale is detrimental to the development of the dairy industry and every farmer and dairyman in the land should raise their voices in protest against any movement tending towards the supplanting of the dairy industry in any way or form.

The sale of skim milk labelled as such and at a reasonable price may be permissible, but the present day tendency where there is no supervision of the milk supply is towards the lowering of the legal standard in butter-fat content, to the extent that unsuspecting customers are occasionally dealt out a sample of skim milk at whole milk prices.

Not long ago a lady asked a certain milk vendor if he could sell her a pint of cream. The vendor went to his team where he was seen pouring the cream off several milk bottles into a pint bottle and refilling the bottles from which the cream had been taken with milk from a can. We venture to say that whoever the customers were who received the bottles from which the cream had been replaced with milk, were not satisfied with the quality.

We believe every city, town and village where milk is vended should make arrangements for some inspection system, whereby the consumers would be protected from the wiles of dishonest vendors.

ARE YOU OUT OF SORTS?

If so, does it pay? No! for persons in such a condition are irritable with their "back up" and "a chip on their shoulders" looking for "the hat in the ring." This is not at all conducive to business harmony and co-operation—the fundamentals of efficiency and success—for there is "nothing improved by anger except the arch in a cat's back." Here's a good remedy: "Wear a smile on your face and a flower in your button-hole." Try it.

* * *

Despite the splendid winter weather we were experiencing on November 22nd when we wrote an article for our December 4th issue, our predictions of a much needed thaw came true.

The snow has melted, and even the good old St. John river that Jack Frost had so early sealed against navigation, is again we hear, free from ice.

The melting snows and a considerable fall of rain during the past two weeks has very materially helped to give new life to the brooklets, raise the rivers and fill the almost dry wells to the brim.

You may or you may not be a handy man with tools, but that is no reason why you should go about your work in a round about, time-killing, man-killing way. Make the work easier for yourself so you can have more time to devote to other things. There are many short cuts to effective work and a little brain work will help you. Plan that water supply for your live stock that we wrote about in the last issue of the Maritime Farmer. If you cannot do the work yourself, get some one who can do the work. As to financing the work, all we have to say is that where there is a will, there is always a way. Don't you think so too?

* * *

Are you putting forth every effort to conserve your heifer calves. Grow as many of them to maturity as you can. You will find ready sale for all you can raise at remnuerative prices. The days of low priced cattle is gone forever and a new era has dawned for the stock raiser. You will be well repaid for any efforts you put forth by better breeding, feeding and weeding.

* * *

The evident necessity for the strictest economy in the use of the ocean tonnage available for the supply of foodstuffs, as evidenced by the British Government's decision to appoint a food controller, has given rise to the hope that the production of intoxicating liquors, so much of the raw material for which not only has to be imported, but might instead be used for nourishing food, will be prohibited.

"'Tis a consummation devoutly to be wished."

Short Courses at the N. S. A. C.

Men's Short Courses

"Preparedness" and the necessity for it is the great lesson of the war. We should not fail to learn it. At the present time Canada is enjoying a period of unprecedented prosperity due to the employment of her labor and capital in the production of munitions and other goods required for the year. Farmers are reaping a part of this prosperity—the ones who were best prepared getting the biggest share. But this present prosperity is artificial. The day the war is over, it will cease. Then will come the era of the farmer, the producer of real wealth, whose position at this crisis in the history of Canada will be exalted as never before. Get ready for it. Be prepared. This is where an agricultural education counts. And this will be the purpose of the 1917 Short Course.

A War Time Short Course

Useful in times of peace, the short courses are more useful in times of war. They meet the educational needs of the farmer who, by reason of short labor conditions, can only get away for a brief time. To further help meet the difficult labor situation, the course for 1917 will be shortened a day, closing on Thursday of the second week instead of Friday. Moreover this reducing the course will offset any extra charge for board which, owing to war prices, may be made.

A Course for Everybody

The course is open to boys and men of all ages from 16 to over 70 and as in former years large numbers are expected, not only from Nova Scotia but from the other Maritime Provinces as well. Naturally a large attendance of farmers and farmers' sons of the country is anticipated, but in addition the attention of Clergymen and business men and professional men, who are interested in rural problems, is directed to the benefits they will derive from attending the short course classes.

The special extra attraction for 1917 will be the lectures and demonstrations in field crops and seed selection by C. A. Zavitz, of Guelph, recognized as the foremost authority on this subject in America. Dr. Zavitz has bred new varieties of oats and wheat and has improved old varieties to such an extent as to have produced enough extra crops in the province of Ontario to pay for the Agricultural College several times over. His services have been sought again and again at Washington and other prominent places. Not only is Dr. Zavitz a practical expert but he is a most inspiring teacher. His lectures will begin Wednesday morning, Jan. 3rd, and continue until Saturday afternoon Jan. 6th. It is to be hoped that many will come to the short course this year if f r no other purpose than to take in this series of lectures by America's greatest expert.

Never was the cattle and other live stock on the College Farm in such splendid condition for showing. Its an education in itself to see the cows and other stock and to study them critically in the judging pavilion as will be your chance at the Short course. Those great Holsteins including Victoria Calamity Clay that gave 22835 lbs. of milk in twelve months last year, and a big crop of calves and yearlings from these cows, that bid fair to beat their ancestors will all be there. Among the Ayrshires are several mature cows that have been producing over sixty pounds (twenty-five quarts) of milk per day, and a two year old, the third generation of College Farm stock, that with her first calf has produced fifty-four pounds of milk in a day. Then there is the new Ayrshire bull Jean Armour's Lotus Laddie of championship breeding, his dam Jean Armour being the first Ayrshire cow in the world to beat 20,000 lbs. of milk in a year, her actual record made at twelve years of age being 20,174 lbs. of milk and 774 lbs. of fat. A daughter of this cow Jean Armour 3rd, has just made the world's three old record, having produced in twelve months 21,938 pounds of milk and 849.18 lbs. of fat. Nor should anyone overlook the dual purpose Shorthorns, which, while giving only about half as much milk as these special dairy cows are, nevertheless, grand individuals of their class and well fitted to fill the niche where farmers want beef and milk combined. But we cannot tell the whole story in this short space. You should come and see the cattle and hear the story for yourself.

As in former years the College herds will, at Short Course time, be supplemented by drafts from the famous herds of the Retsons, the Blanchards, the Dickie's and others in the vicinity of Truro. It will be a great show, interesting in itself, but especially valuable to individual farmers and to representatives of Agricultural Societies who are aiming to select improved sires with which to develop the live stock of their communities.

The best collection of breeding hogs ever owned at the College Farm will be on exhibition. Especially noteworthy are the boars, one of which is considered by many to be the best of his breed in Canada. There are four of his daughters on the farm, spring pigs, that at date of writing average 300 lbs. each. They are models both for bacon and for the economical production of pork. W. R. Reek, Director of Agricultural Instruction for Prince Edward Island will assist the college staff in the subject.

The Live Stock Division of the Federal Department of Agriculture will unite with the College staff in putting on an attractive and valuable course in sheep husbandry. In addition to lectures on the care and selection and demonstrations on the judging of sheep, special attention will be given to improved methods of marketing wool, by followin which farmers in some communities of the province realized last season from five to cents per pound above the prevailing market prices.

Horses, which in former announcements claimed first attention, are here presented last for they are not moving so briskly as in years gone by. But market experts at Ottawa say that the future of horse breeding is of golden promise, provided, farmers breed only the best. Demonstrations and lectures along this line will be conducted at the short course. Horsemen will enjoy inspecting some of the magnificent individuals in the college stud.

Seed Fair

THE NOVA SCOTIA PROVINCIAL SEED FAIR will be held at the College on Tuesday, Jan. 9th. With a view to partially making up for the non holding of the Maritime Winter Fair and the Seed Fair in connection with it, a larger list of prizes than usual is offered at Truro this year. No matter from what part of the province you hail, write to the College for the prize list and plan to show some oats, or wheat, or other cereal or timothy or clover or turnip seed, or potatoes. If it is not your intention to show, you can still learn a great deal from the Fair and moreover it will afford a splendid chance for those who wish to buy i prov d seed.

More progress has been made in dairying in the last semi-decade than in any other line of farming in the province—and more money too. At the short course, instruction will be given in the foundation end of the business, the cow, and also in the manufacturing of her products. Besides the making of butter and factory cheese, special attention will be paid to home made cheese, cream cheese, part milk and part cream cheese, ice cream, etc. The testing of milk and cream and skim milk for butter fat will be included. Instruction in all these branches will be provided for both women and men.

Dairymens' Convention

The Annual Convention of the Nova Scotia Dairymens' Association will be held at the College on the 3rd and 4th of January. In addition to the regular proceedings of the Convention there will be a contest open to all the creameries of the province for the best butter. Prizes to the value of $350.00, including a $125.00 challenge trophy, will be awarded. The judging will be done by experts, who in addition to their judicial duties will be prepared to give instruction to any who may seek it.

Everyone should eat vegetables. They are an economical food, delicious, wholesome; their regular use prevents disease and fosters health. The food material they contain costs only one fourth or one fifth of the same material in meats. They are especially valuable when crisp, succulent, sweet, tender and juicy—as they are right from the garden, or next best from proper storage. To encourage the greater growth of vegetables, to teach how to grow the best quality, and to do this in respect to new kinds and varieties, as well as the old standards, is one of the main purposes of the Horticultural course. Combined with this will be instruction and demonstration in the canning of all kinds of vegetables and fruits—an art which almost brings summer conditions to the winter table.

Apples and other fruits come in the same catagory, but there is a bit more luxury added. Everybody likes them and should have them. Nor is there any reason why, with proper selection of varieties of apples and other fruit, they cannot be had almost every day of the year. Come to the Short Course and learn about varieties, how to prune trees to encourage large well colored fruit, how to keep off insects and diseases by spraying and other methods, and even how to graft.

Instruction in all phases of vegetable growing and fruit culture will be given by members of the College staff assisted by representatives of the Dominion Department of Agriculture and by successful growers from the province.

The orchardist in particular and the general farmer too are each year realizing the practical value of a thorough knowledge of the various insect pests and plant diseases. The Short Course will afford a great opportunity for any who are seeking this knowledge. Students may arrange for special instruction in the use of the microscope, which is necessary to a first hand knowledge of many of these pests. During the summer successful experiments have been conducted in the Province in the control of rot in potatoes and club roots in turnips and cabbages. Mr. P. A. Murphy, of the Division of Botany of the Federal Department of Agriculture who is an authority on diseases of the potato and turnip etc., will be the special instructor in this phase of the subject.

The ever increasing price of eggs and poultry has added to the attractiveness of the poultry industry. Poultry raising appeals particularly to small lot holders and to farmers who live near towns and cities where fresh eggs are in constant demand, but it is also a profitable business as a side line to dairying or beef raising or general farming, and should receive far more attention than is now given to it. A special feature of the 1917 course will be a consideration of the proper system of grading eggs for market with special reference to the working of the Canadian Egg Standard system which has been adopted by wholesale dealers in the largest centres of Canada. Instruction will be given in the art of making hens lay, fattening and dressing poultry for market, hatching and rearing chickens by natural methods and artifically, constructing poultry houses and organizing of the poultry business so as to obtain better prices.

What to do when your animals are sick, and better how to keep them from disease will be the essence of the Veterinary Science instruction. Added to this will be practical classes in the judging and care and management of horses. There will be no more instructive and valuable part of the course than this Veterinary Science, which will be given by Dr. J. A. Sinclair.

Several of the leading farm implement and gasolene engine manufacturers are planning to exhibit their machines and engines in the College at Short Course time. Arrangements are being made to bring a practical expert in gas engines to give practical instruction in the operation of these machines which are now being used so extensively by farmers.

In this brief outline we have not exhusted all that may be taken up in the course. Should there be any students wishing instruction in barn construction, bee culture, agricultural bacteriology, agricultural chemistry, or botany, provision will be made to offer special instruction. The student has only to make his wants known to the principal on his arrival when arrangement will be completed.

Women's Short Course

Owing to the increased space and other advantages afforded in the new Science Building, the 1916 Womens short course was easily the best one ever held at the College. The course for 1917 promises to be just as much better.

This course is free to all women and girls and our advice is to put your application in early before the list fills up, for there is a limit to the number of students we can accomodate.

The subjects will include Cooking, Dress-making, Dairying, Horticulture and Poultry. Besides these, lectures and demonstrations will be given in Laundry Work, Dry Cleaning, Short Cuts in Home Work, Modern Efficiency, Home Nursing, and Millinery. Some time will also be devoted to Invalid Cooking with particular attention to the necessary nourishment for patients suffering from various diseases.

Bring note books, pencils, aprons, and wear a short sleeved blouse or sleeve protectors. Come prepared to get as much out of the course as you possibly can and ask as many questions as you like.

If you wish to secure a boarding house let us know as early as possible. We plan to meet all trains and generally recommend that you engage a boarding house after arrival

(Continued on page 160)

FROST INJURY.—DIFFERENT WAYS IN WHICH APPLE TREES ARE AFFECTED

(Continued from page 144)

for further protection. The roots of trees in sod are also protected in the same way. The mulching of the ground about trees with straw or manure will also protect the roots from injury. Another reason why we have not been troubled with root-killing during the past twenty years at Ottawa is that practically all our grafted trees have been since that time grafted on crab apple roots, not on Pyrus baccata, although some are on this stock, but on the seedlings of Martha, Transcendant, and other cultivated varieties. The apple seedlings used by nurserymen for stocks vary much in hardiness Every tree probably differs more or less and some are undoubtedly quite tender. The result is that varieties otherwise hardy, when grafted on these roots, fail. Seedlings of the crab apples are much more likely to be hardy, and we believe that if some nurseryman would make a specialty of growing the apples suitable for the colder parts of Canada on crab apple stocks, he would in time sell a large number of these trees. The advantage of crab apple roots has been very marked in the Northwestern States where trees on ordinary apple stocks have been killed out, while those on crab roots were uninjured.

Bark splitting.—This is an injury which usually occurs on young trees. It is due to the expansion caused by frost when trees are in a very succulent condition. It occurs when trees have grown late and there is a heavy fall of snow before the ground freezes. The soft snow appears to soften the bark of the trees and when the temperature drops suddenly the bark is loosened. The injury is usually greatest near the ground. In Nova Scotia the Gravenstein and other apples are affected with what is known there as "Crown rot," which apparently destroys the bark about the tree near the ground. From what can be learned of this injury, which occurs mostly in well cultivated orchards, and in moist ground, it is believed that the cause is that the Gravenstein grows too late and is subjected to the conditions just referred to, namely, of being too full of sap. Traces of disease have been found at these injured parts but it is believed that the disease is secondary rather than the principal cause. Bark splitting can be prevented to a large extent by having the wood of the trees well ripened when winter sets in, and this can be brought about, usually, by stopping cultivation in good time. When young trees are injured by bark splitting they may be saved if not too badly hurt by covering the injured parts with grafting wax.

Trunk splitting.—Trunk splitting, while not a common injury in orchards, is not rare. It was long thought to be due to the expansion of trees which had been "hide-bound." This splitting is now thought to be due to the cells of the medullary rays contracting to a greater degree than those of other parts of the wood when there is a sudden lowering of temperature below freezing. The medullary rays are plates of cellular tissue which radiate from the centre of the trunk to the bark. It is trees which have made late growth and are well charged with sap that are usually affected, hence thorough ripening of the wood is necessary for the prevention of this injury also.

Sunscald.—The injury to apple trees known as sunscald is one of the most serious hindrances to successful apple culture, particularly in the northern and eastern parts of Ontario, in the province of Quebec and other parts of Canada where there is warm bright weather in early spring followed by severe frosts. Newly planted or young trees are, as a rule, more seriously affected by it than older ones. The unhealthy appearance of the bark on the south and southwestern sides of the trunk of the tree and on the larger branches is the first indication of this injury. Afterwards the bark and wood dry up and fall away. Trees are often so badly affected that they die. Sunscald occurs during the latter part of winter or very early in the spring when there are warm days and cold nights. In the case of the apple tree, only a part of the trunk is thus affected, being that part which is exposed most to the sun. The hardiest varieties are the least affected. The injury may be prevented to a large extent by only planting trees which are headed low, thus exposing but a short trunk to the rays of the sun; also, by inclining the young trees somewhat to the southwest when planting, thus preventing the sun's rays from striking the trunk except for a short time each day. When trees have been planted and are liable to become sunscalded the trunks may be protected by using a veneer of wood which encircles the trees, thus preventing the rays of the sun from striking the trunk. White building paper tied around the tree is also useful and as it is very good as a protection from mice is one of the best preventives. Boards, sacking and many other things may be used to protect the tree from sunscald. Nothing, however that will be likely to harbour mice should be used.

Mr. H. S. Cunningham, District Representative for the four Cape Breton Counties and his assistant, T. C. Munn, starting on a trip. Cunningham at the helm.
(Note equipment carried in the car).

Crotch injury.—The effects of crotch injury have been very serious in the province of Quebec and in some parts of Ontario in recent years. On examination it is found that in the centre of the crotch and on the branches diverging from it, but close to it, the bark is dead. As a result of this killing in the crotch the tree loses its strength there, rot sets in and eventually the tree is destroyed by the loss of one limb after another at the crotch. This crotch injury is thought by some to be due to ice lodging in the crotch. There are several theories as to why the ice should cause the bark to die. One is, that it acts as a lens and concentrates the rays of the sun, causing a scalding of the bark. The position of the injured limbs alone would seem to be sufficient to show that this theory is not a good one. It seems more likely that the injury is caused by the softening of the bark by the melted snow or water before freezing, and that after freezing the bark which is, even before this, probably tendered than at any other part, owing to its being most shaded there in summer, is subjected to a severe frost and it and the cambium are both injured. It has been also suggested that as this part of the tree is later to mature than some other parts, a severe frost will cause injury by tearing the bark from the wood owing to the contraction of the latter. One of the best means of preventing crotch injury is to grow trees with as little crotch as possible, training with a central leader.

Killing-back.—This is the indication of inherent tenderness of the variety, or of immaturity of wood. Plants which need a long season in which to mature their wood will go on growing so late when cultivated in a climate having a shorter season that their wood is not matured and the young wood or the whole tree may be killed. When the wood of a tree which would otherwise prove tender is well ripened it will often survive, but there are fruits and varieties that will stand only certain minimum temperatures, after which their protoplasm or life is destroyed. It sometimes happens that varieties of fruits which are apparently hardy will survive until after a heavy crop followed by a severe winter when, owing apparently to lowered vitality, they will be destroyed. The Ben Davis apple is an example of this. As has been said, killing back may be due to the immature condition of the wood, or it may be due to the death of the protoplasm. When winter killing is due to immaturity of wood it may be prevented to a large extent by methods of cultivation. From experiments conducted at Ottawa by the chemist, Dr. Frank T. Shutt, it was found that varieties of apples which were known to be tender had usually more moisture in their twigs in winter than those which were hardier, partly owing, no doubt, to the fact that they were more immature than those of trees which were hardier. When trees of certain varieties are liable to be killed after heavy bearing, thinning of the fruit should be practised in order to prevent the lowering of vitality.

Black Heart.—Black Heart is a condition found in trees grown in cold climates. It is caused by the death of the alburnum or young wood in winter. The bark and cambium remaining uninjured, growth continues in the spring much as usual, but the injury remains. Another severe winter or several winters while the trees are young may cause repeated blackening in the same tree and yet the tree continues to make good growth, the cambium not being killed. If a branch breaks off a tree which has been blackened for a number of years, rot may gain an entrance and most of the interior of the tree may rot and some day the tree will blow over and it will be found merely a shell which has been held together by the trunk and a few outside layers of wood. Where repeated frost injury occurs, as in such a case, the tree is not hardy enough for the climate it is growing in. At the Central Experimental Farm many trees are black-hearted but most of these trees are growing and bearing well and there is no outward evidence of this injury. On cutting down many bearing trees which it was desired to remove for other reasons black heart was present but there was no evidence that rot had set in. Black Heart in its incipient stage may be prevented by careful attention to northern grown nursery stock. During the winter after the first season's growth of the young grafted trees, most varieties are likely to be killed back, and when the tree begins to grow in the spring it will be found that the alburnum or sap wood is blackened below the point where growth begins. This is Black Heart. Careful nurserymen now cut back the young trees almost or quite to the ground the first year, in order that the tree may start growth from healthy wood. The same thing may occur the second season, and the trees are again cut back, but it is usually not necessary to cut so far. Even after trees are three and four years of age and have been planted in the orchard they may get Black Heart by winter injury, but it is much rarer than when they are neglected in the nursery. In November of 1911, 22 degrees of frost caused much Black Heart in nursery stock. It is very important to have the wood ripened up well where such severe frosts are likely to occur in autumn. Trees badly affected with Black Heart the previous year do not make as vigorous a growth as uninjured trees. The growth also will be somewhat spindly. The tenderer varieties are more susceptible to Black Heart than the hardy ones.

Discoloration of Sap Wood.—In parts of Canada where there is often a sudden drop in temperature several degrees beow freezing while the wood of nursery stock or young trees in orchards is not yet well ripened, a discoloration or browning of the sap-wood occurs. The writer found on examination of nursery stock after eight degrees Fahrenheit of frost that some varieties showed this discoloration. So far as we are aware there is no evidence to prove that this slight discoloration will seriously injure the tree if it has any bad effect at all. In districts where these early severe frosts occur trees already planted in the orchard are liable to become discoloured and if the frost is severe enough they are likely to become black hearted.

Trunk Injury—Body Injury.—The fact that trees loose moisture in the winter has been proved by careful experiments. In an experiment conducted at the Central Experimental Farm by Dr. Frank T. Shutt, Chemist, in the winter of 1902-3 to determine the moisture-content of apple twigs, it was found that during the depth of winter there was a gradual loss of moisture. Experiments at other places confirm this. In the Northwest, where the weather is very cold in winter and there are often no trees to check the force of the wind, trees lose so much moisture that it is a common occurence for them to die simply from drying out. The same trees if protected by a good windbreak would in many cases not be injured. It has been written, although we are not sure that the figures are correct, that the same surface which would in calm weather exhale 100 parts of water would exhale 150 parts in a high wind. These proportions would probably be considerably less in the case of fruit trees protected by bark, but it shows what a drying effect wind has. The winter of 1906-7 was a very cold one in eastern Ontario and the province of Quebec, and there was considerable injury from body-killing. This, for the

Butter Parchment at Farmer Office

MOTHS IN NEW ENGLAND

The warfare against moths last year included the liberation of 12,947,700 parasites which prey on the gypsy moth in Massachusetts and New Hampshire alone, by the federal authorities. Of these 661,713 were Japanese parasites. These were liberated in 28 towns in Massachusetts and 11 in New Hampshire. Another enemy of the gypsy moth was colonized in 14 towns in Maine, 31 towns in New Hampshire, and 71 towns in Massachusetts. In all 12,286 colonies of this species containing 12,286,000 individuals, were liberated to aid in the work of controlling the gypsy moth pest. These two parasites place their eggs in the egg of the gypsy moth, the eggs of the parasites hatch into larvae, or grubs, and these feed upon the developing caterpillar within the eggshell and kill it before the egg has a chance to hatch. According to the annual report of the federal bureau just published the parasites previously released seem to be gaining a foothold and many of them are now found in larger numbers and over a wider territory than ever before. The Calosoma beetle, another insect enemy of the moth, the report states, is continuing its good work, although apparently the beetles are not so numerous in certain localities as they were last year.

In New England, in co-operation with state officials and other state agencies, considerable progress is being made in fighting the gypsy moth. This year in two towns in New Hampshire, two in Vermont, four in Massachusetts and three in Connecticut, the insect has apparently been exterminated. Extensive scouting to determine its spread showed that the moth has been found in 15 towns where it was not known to exist before. This gives a net increase of only four infested towns, which, the entomologists say, is a much smaller number than has been reported in previous years.

All of the infestations discovered in these towns have been carefully treated and a large amount of creasoting of egg masses and banding and spraying of trees has been done in towns immediately inside the border. During the year approximately 35 tons of arsenate of lead were used, and over 12,000 miles of roadway and 24,000 acres of woodland were examined.

To prevent the spread of gypsy and brown-tail moths in nursery stock and forest products, the inspectors examined 37,444 shipments, 664 of which were found to be infested. The infested specimens were treated before their shipment was permitted.

The severity of the brown-tail moth infestation has ssteadily decreased, and the insect is by no means as abundant as it was the previous years. The various lighthouses along the coast of Connecticut and Long Island have been examined, but no migrating moths have been found. Fewer moths have been found on trains coming from infested regions during the season when the moths are flying than in any year since the work has been begun. Thi s indicates quite clearly that the moth is not spreading into new territory, and the conditions in the territory known to be infested showed marked improve- and in many of the towns where this insect once caused much damage and annoyance it has done ittle injury during the year.

CHANGE IN APPLE REGULATIONS

Under date of November 18 Sec Wheeler of Massachusetts writes: We have decided to make a change in the regulations for inspection of cold storage apples under the Massachusetts apple grading law. Hereafter, instead of attempting to stamp the barrels we shall issue a clearance card to the owners of apples in storage which are correctly marked. This card will contain the storage number of a particular lot and will authorize the sale, without further inspection, of all apples in that lot. The ruling follows:

Apples which have been in cold storage shall not be sold or distributed, or offered or exposed for sale or distribution, in closed packages until they have been inspected in accordance with rules and regulations to be prescribed by the secretary of the state board of agriculture.

Apples in cold storage will be inspected as soon as may be after they have been placed in the storage warehouse. Owners of packages found correctly graded and branded will receive a "record of inspection" stating that the packages comply with the law and these apples will not hereafter be liable to inspection.

In cases where the packages are found to be misbranded or the contents adulterated the owner will be notified and given an opportunity to change or correct the marks to comply with the law.

Parties who sell apples from storage without making the changes required will render themselves liable to the penalties fixed in Section 14 of the act.

The above regulation refers only to Massachusetts apples in closed packages or out of state apples branded as Massachusetts standard grade.

GIRDLING WILL KILL TREES

What drug will kill live or growing trees? Do you know if there is some kind of a drug which can be successfully used? I have some trees which I wish to get rid of.—George W. Crain.

We do not know of any drug which can successfully be used to kill growing trees. Preparations which might be applied to the soil at the base of trees would probably make an expensive operation and might render soil unfit for growing other plants at a later time. Probably the best way to kill a large tree is to girdle it competely around; then cut it down at your convenience. If it is a number of very small trees which you wish to get rid of, probably a good ax applied right below the crown of each tree would accomplish what you wish. If the ground was to be put under cultivation later on, the plowing would turn up the roots, which could be picked up and cast aside.

ENCOURAGING POTATO GROWING

The New Brunswick Potato Growers' Association is indebted to The Colonial Fertilizer Co. for $100.00 to be used as prizes for encouraging the improvement of the new Brunswick potato industry. As official organ of the Association the Maritime Farmer wishes to recognize the donation and bring it to the attention of the potato growers of the province. Every potato grower in New Brunswick should become a member of the Potato Growers' Association and work with it for the elimination of potato diseases, for better seed selection, for better cultural methods and up to date marketing.

Following is a copy of the Colonial Fertilizer Co's letter to the President of the Association:—

Colonial Fertilizer Co.,
Windsor, N. S.
Nov. 30, 1916.

T. W. Caldwell, Esq.,
Florenceville, N. B.

Dear Sir:—

We have a letter from our general manager in reference to prizes to the Potato Growers' Association, covered by your recent letter.

When writing him we recommended that if he was agreed to it we would make the sum of $100.00 and he writes us that we would donate this in the name of the Colonial Fertilizer Co. Such disposition of it and such prizes as you offer we would leave entirely to your Association but it would be the writer's idea that such prizes as are offered be general prizes and not be limited to any particular brand of fertilizer used, or be hedged about with conditions which would not give the farmers the freest scope.

This is our personal opinion but we donate the $100.00 to be used in any way that your Association sees fit.

Yours truly
COLONIAL FERTILIZER CO.
per A. P. Clark.

DAIRYING.

THE COW AT CALVING TIME

There is no time in the whole milking period that has such an important bearing on the establishment of a standard for production or the year as the period previous to and following calving time. It is understood by many, but not by all, that if a cow is allowed from six weeks to two months in which to rest from one lactation period to the next, she will yield more than when milked continuously up to the time of parturition.

The act of calving brings stimulation to the milk producing organs, which is the only natural and effective means of stimulating milk secretion, and it is a serious mistake not to make the most of it. It is necessary to handle the cow in such a manner as to derive full benefit from this stimulation while it is yet present, since with most cows it rapidly wears off if not utilized.

At this time of year, with cows freshening in the fall, this question concerns many. Rather liberal feeding, which actually builds mild nutrients on the body, during the last few weeks of the lactation period, and while the cow is dry, is the secret of preparing the cow for the succeeding lactation period. This may appear to be wasting feed, but this is the important period when it is most valuable.

During the last few weeks of the milking period grain may be fed at the rate of one pound to each two pounds of milk produced, reducing at the period when the cow is to be dried. A good many have trouble in drying off persistent milkers by the plan of skipping milkings, but when less than 14 pounds of milk is yielded, daily milking can be discontinued at any time without serious difficulty if accompanied by a reduction in the feed. The udder will become filled, but the fluid contents will soon be absorbed.

When dry, about eight pounds of grain should be fed daily, more if the cow is in poor condition. It would not be profitable to feed inferior cows this way. These, however, cannot always be detected from the other unless all have an equal chance, and weeding is practised, based upon the record of production. The grain ration should be bulky, laxative and nutritious, having slightly more carbohydrates than a milk ration, with a nutritive ratio of about one of protein to seven of carbohydrate and fat equivalent. If a high percentage of fate is sought even more liberal feeding of grain will be useful.

During this period protein and fatty tissues are actually being stored upon the body to be used in the production of milk before the cow is in shape to digest and assimilate a full ration. A cow is like a toboggan in that the higher she starts at the beginning of her slide, the faster and longer will she keep running. It is just as serious to crowd the appetite during the first month after calving as to neglect to lay on this supply of nutrients. The cow should be kept hungry. If fed all she would eat harm will be done, and a check on her flow is the natural result of going "off feed," as most cows reach their limit early by this sort of handling.

A week before calving reduce the grain to four or five pounds, feeding mostly bran and oats. On the day of calving a pound and a half of epsom salts, luke warm water, and good hay are enough for a well-conditioned cow, although two quarts of bran mash may be useful. Begin the next day feeding lightly and after four or five days introduce a grain mixture gradually. Increase this gradually about one-fourth pound per day. DO NOT EXPECT A COW TO HANDLE ALL THE FEED CALLED FOR BY HER YIELD OF MILK. If she has been properly conditioned and is coming to a good flow from one month to six weeks is early enough to get her on full feed. For from three to six months she should gradually lose the flesh stored up.—F. C. White, Dairy Dept. Conn. Agri. College.

THE CASE FOR DAIRYING

It has been a matter of common note, that a country, province, or even a neighborhood, that pays considerable attention to dairying is a prosperous one. The buildings are usually painted and in good repair; fields well cultivated and cribs and granaries demonstrate the fertility of the land. There are several reasons that the average person could give offhand as to why this is true, but it remains for an Australian dairy professor to embody all these reasons in about as brief and striking a way as we have ever seen. He summarizes the advantages of dairying in the following 12 reasons:

1. It takes less fertility out of the soil than any other form of agriculture and hence it is useful in following a well-regulated system of rotation.
2. It can be combined readily with other forms of agriculture.
3. The dairy provides in winter a quantity of stable manure in which the straw from the farm is profitably utilized.
4. The by-products from the cow, skim milk, whey and buttermilk, are a source of income in raising pigs and calves.
5. Dairying gives constant and regular employment of a light character to every member of the farmer's family.
6. Dairying inculcates habits of punctuality, industry, cleanliness and thrift on the farm.
7. Cheese and butter are condensed products and the cost of carriage, in comparison with their value, is less than that of any other farm product.
8. The demand for good butter and cheese on the world's markets is unlimited and, so long as the quality is maintained, an all-round, even and profitable price can always be secured.
9. The monthly check from the creamery provides the mainstay in the household as against the precarious returns from yearly crops.
10. In mixed farming the income from the dairy is most reliable.
11. The farmer's household, as a result of dairy work, is always supplied with fresh milk and cream, butter, cheese, pork, bacon and veal.
12. Storekeepers, traders, bankers and financial men all fully realize, after years of experience, that wherever dairy farming is conducted farmers are most prosperous, mortgages are rarely found and the value of landed property becomes considerably enhanced.

Our Australian informant has made a complete case. We might, however, take a look at the other side. Dairying is the most exacting occupation in the world. It is a case of "daylight to dark," Sunday and every other day. People who devote their lives to the pursuit of such an occupation, have a right to expect the highest form of remuneration. Our old friends, "supply and demand," are actively at work, however, and prices of butter, cream and milk are on the advance. They are not, by any means, high enough yet, but we are in hopes that before long the dairyman will receive what he deserves for his output. When he does, dairying will come into its own. In the meanwhile, get ready. It takes years to develop even a small dairy herd—and more years to develop the man himself along dairy lines.

BRINGING UP THE DAIRY CALF

On this subject there will as usual be much diversity of opinion. Much will depend on whether the calf is pure-bred and deserving of special treatment, or on what is to be done with it afterwards. Taking the average dairy calf it is, I think, preferable to take it from its mother as soon as it is born. This keeps the cow quieter and less liable to be excited, therefore, she recovers a normal condition quicker. The calf does not suffer in the least from the early separation, and, on the whole, gives less trouble, as it very seldom goes to suck the cows afterwards if never allowed to start. There is no trouble in feeding the calf for a time or two with a bottle or teaching it to drink right away, and the calf will grow and thrive just as well as if left with its mother.

It has been said of the heifer calf, that the first three months is the making of the cow and it repays the farmer to put himself to a little extra trouble until the calf passes this period. I find that the cow milks easier and stands quieter when the calf is not allowed near her. While that is my practice and experience my nearest neighbor always allows his calves to remain along with their mothers for the first day, then separates them. He claims this is being more natural and less trouble as well as more beneficial to calf and cow alike, than immediate separation. But I have observed that when the calf is removed, the cow has been unduly excited and has remained in this condition sometimes for a day

PILES CURED at HOME by NEW Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Butter Parchment

Farmer Office

Sussex, N. B.

or two. The calf has also tugged and strained at its halter in its frantic struggles to get back to its mother, whereas, when it is tied up right away, it has neither strength nor inclination to strain and takes to its halter quite naturally.

THE HARD WORKING COW

The cow will make a factory of every farm if given a chance. On every hand by-products of grain farming are going to waste. A fertilizing value of $375 is represented by the feed which a cow will convert into a ton of butter that removes but a few cents' worth of fertility from the farm.

The cow is a hard worker, but she charges nothing for the privilege of transforming the green feed, alfalfa and other farm feeds into one of the best foods known to man. What greater work could be expected of a domestic animal?

The product of the cow is a crop that never fails if we do our part. The dairy pay checks comes each week and helps to put farming on a cash basis.—Nor'-West Farmer.

DAIRY BREEDS DIFFER IN COMPOSITION OF MILK

Which do you prefer, skimmilk from a Holstein or from a Jersey cow? It is generally known that Holstein milk has a lower percentage of butterfat than milk from other breeds. Does the skimmilk from it have a correspondingly lower percentage of it constituents, chiefly protein and sugar?

Chemical analyses made by A. E. Adams, dairy chemist at the Ohio Experiment Station, show that milk from Jersey cows has a higher percentage of protein and sugar than Holstein milk. Guernsey milk is quite similar to that of the Jersey, while Ayrshire milk is intermediate between that of these two breeds and the Holstein.

These analyses indicate that the percentage of protein in milk increases with the fat content, but not in proportion. Skimmilk from Holstein milk having 3.3 percent fat contained 3.5 percent protein, while Jersey milk testing 4.7 percent fat had 4.1 percent protein. The variation in the sugar content showed a similar tendency. Thus the fat content of milk offers a practical basis to compute the composition of skimmilk derived from it.

MORE ON THE SUBJECT OF EARLY CALVING

The illustration in The Nor'-West Farmer of September 20th, showing a grade cow that had dropped a calf at the age of sixteen months, has produced some correspondence relative to the earliest age at which heifers have been known to drop their first calves. D. F. Wilson, of Fork River, Man., a well known breeder of Galloway cattle, writes: "The pure bred Galloway heifer, "Precocious of Minnokin," was calved on March 1st, 1915. On May 1st, 1916, she dropped a bull calf, being fourteen months old to a day. Some years ago we owned a red polled heifer which I had bought during her first winter. In the spring she dropped a calf sometime during her fourteenth month. Her grandsire was a Galloway bull."

Joseph Ivens, Merridale, Man., writes: "I have a cow which is now four years old. She was born in March 1912 and calved in February, 1913. The calf was a normal one, fully developed, but no one being in attendance, it died at birth. I rested this cow for two years, but can see no ill effects from calving at so early an age. I consider this particular cow in no way hurt from the experience. My neighbor, who is doing his bit at the front, will vouch for the above statement. A cow belonging to the same man calved this spring at thirteen months, cow and calf doing well.

One of the biggest drawbacks to the dairy industry is the lack of good cows. Try to fill this need by using good sires and rearing your best heifer calves.

The hands and clothing of the milker are frequent contaminators of the milk. The hands should always be carefully washed and the clothing kept as clean as possible.

Palatibility is that quality of a feed that makes it relished and desired by the animal.

50c BUTTER

Makes Imperative the Use of an Improved

DE LAVAL

CREAM SEPARATOR

WITH the certainty of the highest prices ever known for butter this winter, no producer of cream can afford to run another month without a modern De Laval Cream Separator.

This is true whether you have no separator, or an inferior make of machine, or even an old model De Laval machine.

The waste of butter-fat is relatively greatest in winter, either with gravity skimming or a poor separator.

At present cream and butter prices, a new De Laval machine will almost surely save its cost within three months, and go on doing so thereafter.

There can surely be no good reason to delay the purchase another week, and if it may not be convenient to pay cash it may be purchased on such terms that the machine will easily pay for itself.

See your De Laval agent immediately, or, if you don't know him, address the nearest De Laval main office, as below for any desired particulars.

LIVE STOCK.

HANDY MEDICINE CHEST FOR FARM STOCK

A well-equipped but inexpensive medicine chest for farm use may be made out of a good box and should be supplied with instruments and drugs to meet emergencies. Such articles are a sharp knife, pair of artery forceps, scissors, metal dose syringe, three or four thermometers, galling gun for giving physic balls, gallon can with hose attachment for giving injections, hoof knife, nippers, rasp, hoof hook, hypodermic syringe, needle and thread, bandages and absorbent cotton.

These articles may be purchased at any drug store. A good antiseptic is important. Creolin probably is best and safest and is used in a 2 p. c. to 5 p. c. solution. For a milder antiseptic, potassium permanganate, one teaspoonful to two gallons of water, is recommended.

For a physic linseed oil is good, but cathartic balls are safer and more convenient. Epsom salts may be used for cattle, but are not recommended for horses.

Two liniments are recommended. One, which is mild, is composed of one ounce turpentine, one ounce strong ammonia, 48 grains camphor gum, one to two ounces iodine, and alcohol to make a pint of mixture. A stronger liniment may be made from two ounces camphor, two ounces turpentine, four ounces tincture iodine, 16 grains bichloride of mercury and eight ounces alcohol. This should not be rubbed in unless a blister is desired, in which case use two ounces cerate cantharides and one drachm bichloride of mercury. Another good blister is cantharides one part and lard eight parts.

A good dusting powder is made of 35 parts powdered alum, 13 parts zinc oxide, one part boric acid, one part phenol and one part camphor gum.—DR. C. W. McCAMPBELL.

SHEEP THRIVE IN OPEN SHEDS

Sheep sheds may combine efficiency and economy. The Pennsylvania state college has demonstrated that sheep wintered in an open shed having a southern exposure, free from drafts and affording a dry bed, are in better physical condition than those wintered in a warm, ill-ventilated barn basement. During the lambing season, of course, warmer quarters are necessary. Ewes may then be removed to warmer quarters and later replaced in the shed. After lambs are three days old they will not suffer in the open sheds, even during zero weather.

The shed used to house experimental ewes and lambs at the Pennsylvania station adjoints the south side of a hay shed. The sheep shed is 30x60 feet and cost $200. Its capacity is 100 mature sheep. It was built of hemlock lumber over a superstructure of oak posts. The roof and west end were covered with tar paper. An alley 6 feet wide runs the full length of the inner side of the shed. The hay shed attached affords a place for storage of feed and lambing pens.

The shed is divided into seven pens for experimental purposes. Three lots instead of seven would probably be more desirable under average farm conditions. Under such conditions also, breeding sheep in winter quarters should be divided into groups with reference to age and condition. Breeding sheep should be separated from fattening sheep. An exercise yard 32 feet wide adjoins each pen. These are well drained and dry.

THE HEREDITY OF SEX

Under ordinary conditions, for every 100 female calves born in a herd of cattle there will be 107 male calves. Many cases have, however, been noticed in which the proportion was very different.

Thus, in a herd of registered dairy cattle, about 75 per cent of all the calves born in recent years have been males, while in another case a cow (which has beaten the world's record for milk production) and its two sisters dropped 12 male calves and only 1 female. The study of the ancestry of these animals revealed, both in the first and second case, an hereditary tendency to produce more offspring of one sex than of the other. The possibility of obtaining by selection a breed of fowls that has a tendency to produce disproportionate numbers of one sex has also been proved. Mr. H. E. Sharp, a breeder of the State of Washington, has developed a strain of Langshan fowls that are producing over 90 per cent females, and this trait is being transmitted from generation to generation; he has also found that amongst the chickens hatched from the eggs of a single fowl, the proportion between the males and females varies very little with the change of the cock with which the hen is mated, or from one year to another, whereas it varies enormously in the case of different fowls of the same lot.

The inbreeding experiment of Dr. Helen Dean King at the Wistar Institute, Philadelphia, has given results which lend some colour to the belief that a strain of animals may be produced having a tendency to produce disproportionate numbers of one sex. The experiment has been carried out for six years, and during this time more than 22,000 albino rats have been bred and studied. From the same litter two males and two females were taken; imbreeding was practised to the sixth generation without any special selection; two pairs were taken from this generation, the one (brother and sister) from a litter containing an excess of males, the other from a litter containing an excess of females. There has been steady selection in the opposite direction through 21 generations with strict inbreeding of the animals selected. The result is that, instead of a normal ratio of 107 males to 100 females (which was established at the beginning of the experiment) Dr. King now gets in the one line 150 males to 100 females, and in the other, 65 males to 100 females.—The Journal of Hereditary.

PIGS HAVE BLIND STAGGERS

Pigs are sometimes affected with blind staggers caused by bad, stagnant blood, which is usually produced by too close confinement in ill-ventilated, dirty pens.

Give them exercise in the open air or in a dry, clean, well-ventilated pen with plenty or room. Throw a few pease or whole wheat into some straw or chaff on a clean floor and let them hunt for it, or a little silage scattered over the floor will be good. This will give them exercise and keep the blood circulating. In case of an acute attack drag pig out into the open air and rub it vigorously with cloths or the hands to start the blood circulating, and give the following: For a pig 3 months old give 1 dessertspoonful of epsom salts; for a pig 3 to 6 months old give 2 dessertspoonsful, and for a pig 6 to 12 months old give 3 to 4.

Our new recipe book, "Desserts and Candies", will show you how to make a lot of really delicious dishes with "Crown Brand". Write for a copy to our Montreal Office.

HAD INDIGESTION.

BURDOCK BLOOD BITTERS CURED.

That grand old remedy, Burdock Blood Bitters, has been on the market for over forty years and we claim, without any fear of contradiction, that there is not another medicine on the market to-day that can compare with it for the cure of all disturbances of the stomach.

Mrs. S. Turpin, Colborne, Ont., writes: "I am writing to say that I have used your Burdock Blood Bitters. For a long period I suffered with indigestion, and nothing I took ever gave me any relief, only for a short time. I bought several bottles of B. B. B. from our druggist, Mr. Griffis, and can honestly say I can eat or drink anything I want without experiencing any bad after-effects. I may say that it is the only medicine I ever got any relief from."

Burdock Blood Bitters is manufactured only by THE T. MILBURN CO., Limited, Toronto, Ont.

AGES OF CATTLE AS TOLD BY THEIR TEETH

A cow's age can be estimated quite accurately by noting the appearance of the second set or permanent teeth. The first set is known as the milk teeth. A calf is born with a central pair of teeth and the remaining pairs appear within the first month.

When the animal reaches the age of eighteen months, the central pair of milk teeth is replaced with larger and permanent ones. These are easily recognized, as they are nearly twice as broad as the first ones. Other pairs appear at intervals of approximately nine months, but this may vary somewhat, according to conditions. When the animal reaches the age of twenty-seven months, the intermediate pair of teeth appears, making four permanent ones, easily recognized by their larger size. The third pair usually makes its appearance at the age of thirty-six months, and the fourth pair, the two end teeth, at the age of forty-five months. If there is any variation, the animal is apt to be older rather than younger than the teeth would indicate.

There is comparatively little change in the teeth of cattle after the fourth year until they have been used a few years. As the animal gets older, the teeth become narrower, and by the ninth year there is considerable space between them. After this they shrink away from each other, become discolored, and drop out one by one.

Most of the horn growths takes place the first two years. After this each year's growth is marked by quite a distinct ring, so that the age can be estimated fairly accurately by counting the rings and adding two. The first ring appears at the age of two years.

DESTROYING HORNS

How can I treat my calves to prevent them having horns? I have been told there is some substance that could be rubbed o nthe head of the calves that would prevent the horns growing.—J.

Caustic soda or caustic potash may be used to keep the horns from coming. Either of these may be secured at most drug stores in the form of a white stick. When the calf is about four days' old, clip the hair away from over the young horn, over the space about the size of a 5-cent piece. Then wash this space clean with soap and warm water and thoroughly dry. Then slightly moisten the uncovered end of the caustic and apply it to the horn buttons, applying it first on one side and then on the other, allowing it to dry after each application. This should be done about three times, and great care be taken each time that it does not touch the surrounding skin. In about a week a thick scab drops off, after which, if the operation has been successful, the young horn no longer grows.

A NEW TYPE OF CATLE FOR ALASKA

No breeds of dairy or beef cattle have as yet been found hardy enough to stand the winters in the interior of Alaska without excessive expense for food and protection against cold. As a result, milk sells for 50 cents a quart, and the beef that is consumed in the country consists almost wholly of coldstorage meat brought from the outside. To remedy this situation as far as possible, the Alaska Experiment Station have undertaken to cross Galloway cattle with the Yak, an Asiatic ox much used by Mongolians, Tibetans, etc., for milk and meat as well as work. It is used for a beast of burden at altitudes of 12,000 feet or more. It is extremely hardy, pastures through the winter under the open sky in Siberia, and obtains feed from last year's dead grass dug from under the snow. Crosses of the Yak and ordinary domestic cattle are common in parts of Asia (for example in Turkestan) and have been found of much value.

SHEEP ACCOMMODATION

Prof. H. Hackedorn of the Missouri College of Agriculture makes some general suggestions. He says: "In planning barns or sheds for a breeding flock of sheep, a space of 10 or 12 square feet per ewe will give sufficient room. The essentials of shelter for sheep are (1) dry floor, (2) good roof, (3) an abundance of fresh air, (4) avoid drafts, (5) avoid narrow doors and passages so ewes heavy with lamb will not be injured, and (6) provide sufficient feeding trough space so all the sheep can eat at the same time.

"We find that a shed 25 or 30 feet wide and as long as necessary to house the flock gives very good results at the Missouri Experiment Station. It should open on th south and may be built with a feed trough and feed alley along the north side. Economy of rack space may be secured by the use of movable racks so arranged as to make as many lots as are needed in the shed. These partition racks can be moved out of the way whenever a wagon is driven in to be loaded with manure. The shed should be high enough to afford plenty of loft room. As we feed baled hay, a loft five feet high at the eaves gives us room enough to store a winter's supply for the flock, but if loose hay is put in and fed correspondingly, more loft room must be provided."

Why shouldn't you
enjoy, in your own home,
as smooth, clean and comfortable a shave as the city man, or as anyone else in this broad Dominion? Why shouldn't you own and use the keenest, speediest, most convenient shaving tool in the world—the
Gillette
Safety Razor
The thin Gillette Blades, electrically hardened, honed with diamond dust, stropped in wonderful automatic machines, carry an edge whose uniform, lasting keenness has never been matched. The curved Gillette head holds them rigid—guarded—adjustable by a turn of the handle for a light or close shave.
With the Gillette there's no need for honing, stropping, or careful working round the chin or angle of the jaw! There are no preliminaries—the razor is ready for business—you just pick it up and shave, with the easy angle stroke, in five minutes or less.
The Gillette "Bulldog", "Aristocrat" and Standard Sets cost $5—Pocket Editions $5 and $6—Combination Sets $6.50 up. At Hardware, Drug, Men's Wear and Jewelry stores.

THE HORSE

PRIDE IN HORSES

Good horses always are objects of pride. The better a man's horses the more proud he will feel. The more pride a man has in his makeup the better will be the horse that he drives. The man or the boy who feels genuine pride in horses is a more wholesome object of respect than the one who posses merely a mercenary view of the value of horseflesh.

Pride in horses is a necessary qualification of a successful breeder. Pride is essential to a genuine liking for horses and a knowledge that will enable a man to succeed. Pride in horses is not the pride of aloofness; it is the pride of sincerity and love of good horses. A breeder's success is largely made or marred by the feeling of pride that he puts into his business. An extensive dealer and imported who has progressed from a humble beginning to wealth and fame takes great delight and satisfaction in the fact that stallions which he has sold have sired offspring of such extraordinary merit that the country through which his horses have been distributed has become famous for its good horses. "I always liked good horses and have handled no other kind," this man has said. Had he not possessed such liking and such pride in good horses he might have distributed inferior stallions, with the result that the district would be filled with mediocre horses instead of the high-class kind that is being sought by buyers from all over the country.

Every normal farm boy is filled with a love of and pride in good horses. The boy who is given the opportunity to express that pride is the one who is going to stay with the farm. On an Indiana horse farm where the breeding of Belgians has become nicely established all business is done in the name of the father and sons as a firm. The father states that one son is fitting a stallion for the International show and that another is fitting a pair of geldings. Already animals from that farm have a creditable reputation in the showing and among the buying public. The pride that those boys have and the opportunity that is given for the expression of that pride ensure that they will be in the first rank among the successful breeders of the future.

A successful breeder relates that he grew up on a farm where horses of every common sort were kept. Always he looked forward with suppressed pride to a time when he might own some good animals of his own. When he started out into the world for himself he saved money carefully. Finally he had enough to purchase one good mare and is now nicely established in the business of producing purebred drafters. It was his pride and hope that caused him to stick to his purpose.

The public feels a pride in horses. A community noted for its good horses is invariably progressive. The biger horse shows are always held in the communities where the farmers and horsemen own and breed horses worthy of pride. The community whose citizens feel a pride in good horses finds that the world accords it a greater measure of respect. A community in eastern Minnesota is known for the excellency of its horses. In other lines as well as horses people are looking to that community for products above the ordinary. Salesmen feel that nothing common or inferior can be sold there. Buyers know that they can find large numbers of good animals there. There are few communities where horse shows are supported more loyally.

In nearly all states and in practically all localities the horses are of greater financial value than any other class of live stock. Sometimes their value exceeds the value of all other live stock combined. That fact is sufficient to increase the pride [illegible] of good horses.

H. E. McCARTNEY.

Indiana Stallion Enrollment Board in Breeders' Gazette.

MANY HORSES HAVE DEFECTIVE EYESIGHT

Defective eyesight in horses is a very serious fault, and to it can be directly traced the cause of innumerable accidents. A blind horse is always dangerous under the saddle or in single or double harness. A horse with a defective vision that distorts ordinary objects met with on the road is even more objectionable, in some respects, to ride or drive than the horse that is totally blind. Shying in many instances is the result of poor eyesight.

The buyer or owner who is apprehensive regarding a horse's eyes or eye may satisfy himself whether or not disease exists by following directions here given for the examination of the eye: With the thumb and forefinger gently part the eyelids, thus exposing to view the eye and the mucous membrane lining the lids. The right hand should be used in manipulating the lids of the left eye, and the left hand for the right eye, the finger in each case being pressed on the upper lid.

When it is necessary to examine the inner side of eyelids more minutely, draw upper lid down by the eyelashes with one hand and invert it over the tip of forefinger of the other hand.

Many forms of pronounced eye disease can be discovered in ordinary light, but where it is necessary to examine the interior of the eye for incipent disease or slight defects a more careful examination is necessary.

The interior of the eye cannot be satisfactorily examined in the sunshine or under a clear sky; grave defects can be seen under such circumstances, but for careful examination of the eyes the horse should be taken where all light from above is shut off where it falls on the eye from the front and side. The examiner standing in front will see the reflective rays from the cornea, the front of the lens and the back, and can detect any cloudiness or opacity.

The most satisfactory examination can be made in a dark room by illuminating the eye with a lamp or small electric light placed forward and outward from the eye, and moving it about. If the pupil remains closed or so tightly contracted that the interior of the eye cannot be seen, the eyelids may be rubbed with extract of belladonna, and soon the pupil will be widely dilated.

JAMES BROWN.

THE DANGER OF NAILS

Barb-wire and rusty nails take a heavy toll of horse breeders. The wire is perennially slashing horses' legs and leaving ugly and costly scars. The nails concentrate their attacks as winter approaches and the horses are turned into lots and buildings lately repaired for cold weather. New lumber is bought every fall by the wagon-load for repair work. Where the new boards go in place, old ones with protruding rusty nails come off. If these are thrown on the ground and left for a day they are likely to be left for a week and eventually forgotten entirely. From a financial standpoint the most important work in repairing an old stable or yard fence is to pick up the old boards at once and pile them where stock does not run.

If there are old nails sticking up through boards horses seem especially sure to step on them. The result is sure to be lameness and expense in treating the injury; it is likely to cause either brood-poisoning or lockjaw; it frequently ends in death through these diseases. When a horse steps on a rusty nail it is a wise precaution to have a veterinarian give treatment, so as to prevent a serious infection. It is a wiser precaution to keep all the loose boards picked up and put away.

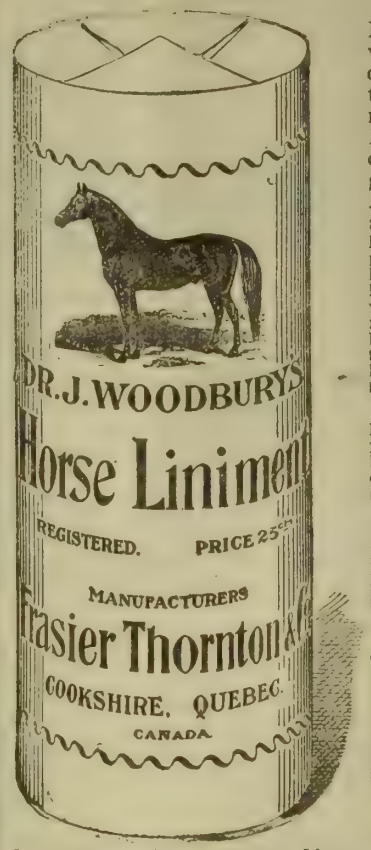
WORMS

R. G. M.,—"(1) Most horses here are troubled with round worms. As it is not easy to treat each horse separately, an effective remedy that could be mixed with the salt would be valuable. (2) Is the treatment of fistula of the withers with hypodermic injections of anti-pus serum practical? If so, please describe the treatment, and state where the serum may be obtained."

REPLY.—(1) A tablespoonful of a mixture of equal parts of salt, sulphur and dried sulphate of iron mixed in the feed night and morning for a week proves effective, but should be repeated after an interval of 10 days. The iron is scarcely safe for a pregnant mare. As a lick, sulphur and iron in half the doses stated might be mixed in the salt for periods of one week. (2) Bacterin for such treatment may be bought of any dealer in biological products, such as blackleg vaccine, and is useful in the treatment of fistula, but it does not obviate the necessity of an operation and the use of caustics and disinfectants. Directions for use are given by the manufacturers.

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

POULTRY.

THE SALE OF EGGS AND POULTRY IN MASSACHUSETTS UNDER GUARANTEE

The Massachusetts Poultry Society has adopted, for the sue of its members, an official poultry products guarantee seal for both eggs and dressed poultry for the market.

The use of the seal is limited to those members of the society who will agree to the following rules:—

(1) That poultry and eggs shall be produced under clean and sanitary conditions.

(2) The poultry and killing houses shall be open at all reasonable times to inspection by members of the executive committee of said association.

(3) Eggs shall be gathered at least once a day, and when shipped or sold shall be not more than seven days old.

(4) No unwholesome food shall be fed to the poultry.

(5) Shells shall be clean in every case.

(6) No eggs which have been in an incubator shall be shipped or sold undersaid seal.

(7) Eggs shall weigh not less than 24 ounces to the dozen.

(8) Dressed poultry shall be fresh killed.

(9) No diseased poultry shall be killed and sold for table use.

(10) The right to use said seal is forfeited whenever this agreement is in any respect violated, the member being held to reimburse said association for all payments and expenses made and incurred by it (after investigation and satisfactory proof) by reason and on account of inferior quality of poultry products shipped or sold under said seal.—The American Agriculturist.

HOW MUCH CAN A HEN EAT?

How much can a hen eat, or how much ought she to eat, is a much discussed topic among certain classes of poultry keepers. Because a hen's appetite varies, depending perhaps on the particular brand of weather, the kind of house she lives in and her own physical condition, which means laying, loafing, brooding, molting, etc., no ironclad rule can be laid down. Health also has to do with the amount of food consumed, and there are no doubt other factors that help to determine whether a hen should eat more or less on any particular day.

The records in the international egg laying contest at Storrs, Ct., seem to show quite conclusively that a hen will consume from 40 to 45 pounds of grain in the course of a year. This means an average daily consumption of about two ounces, or from 12 to 13 pounds per day to each 100 hens. If it be assumed that the average grain mixture weighs 1½ pounds to a quart, then eight quarts or a trifle more would be about the average grain ration for 100 hens each day. This is almost exactly the amount recommended by the Maine station that suggests four quarts corn, two quarts wheat and two quarts oats daily for each 100 laying pullets.

In the laying contest the grain ration consists of wheat and cracked corn only, equal parts by weight. The oats are fed in the mash. This suggestion regarding the amount of grain presupposes that the hens will have before them at all times an ample supply of dry mash to which they can help themselves freely.

If permitted free access to thick sour milk hens will consume just about twice as much by weight of this product as they do of grain. Trials at the Indiana station resulted in the consumption of 93 pounds of milk per year for each laying Leghorn pullet.

Use Rubber To Save Leather —It Is Needed In The War!

Rubber Supply Is Ample— Leather Is Scarce and Very High

Leather is being worn out faster today than ever before in the history of the world, while production is considerably less than a few years ago. While the consequent shortage is keenly felt by the civilian who has to pay half as much again for his own and his family's shoes, it is even more serious for the Government, which must supply hundreds of thousands of soldiers.

Rubber, too, is being used in enormous quantities on account of the war—one British manufacturer, for instance, is working on a rubber boot order for the army which will take 14,000,000 pounds of rubber, fabric and chemicals. But the supply, thanks to the great rubber plantations in Britain's tropical Dominions, is easily keeping up with the demands, and raw rubber, despite a war tax of 7½%, is actually cheaper today than before the war. So, though the fabric and chemicals used cost nearly double, rubber footwear has not gone up very much in price.

These conditions naturally are leading thoughtful, thrifty, patriotic Canadians to save leather just as much as possible by wearing rubbers, overshoes, high rubber boots and heavy farm rubbers. In addition to the very substantial saving in cost, rubber footwear has decided advantages for wet or cold weather around the farm or in the woods. The men like its warm, dry comfort under all conditions, and the women like the way it sheds the dirt instead of bringing it in to melt and track around the house. For the children, too, particularly if they are walking a long way to school, rubbers and overshoes mean a great deal in warmth, comfort and protection against colds.

"Doing Without" Rubbers or Overshoes Is Simply Thoughtless Extravagance

18

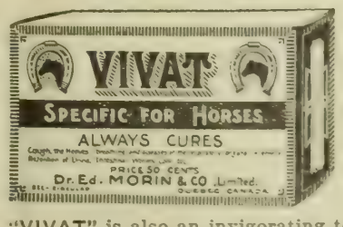
A DAY'S WORK

"Fifty cents a dozen for eggs," gasped the woman; "why, that's over four cents for one egg."

"Yes'm," replied the grocer, "but you must remember that an egg is a whole day's work for a hen."

Hens that lay soft-shelled eggs either lack shell-forming material in the fodd, including oyster shells, or they are not in the best of condition.

The Specific for Diseases of Horses
"VIVAT"



is an active remedy in Powder form which will cure your horse of Coughs, Heaves, Colic and Worms.

"VIVAT" is also an invigorating tonic which gives strength and power to WORK and RACE HORSES.

Well known veterinarians have successfully used it in critical cases. A 50c box will be sufficent for six days' treatment.

SANTA CLAUS AND LITTLE BILLEE

By John Kendrick Bangs

He was only a little bit of a chap, and so, when for the first time in his life he came into close contact with the endless current of human things, it was as hard for him to "stay put" as for some wayward little atom of flotsam and jetsam to keep from tossing about in the surging tides of the sea.

His mother had left him there in the big toyshop, with instructions not to move until she came back, while she went off to do some mysterious errand. She thought, no doubt, that with so many beautiful things on every side to delight his eye and hold his attention, strict obedience to her commands would not be hard. But, alas, the good lady reckoned not upon the magnetic power of attraction of all those lovely objects in detail. She saw them only as a mass of wonders which, in all probability, would dazzle his vision as to leave him incapable of movement; but Little Billie was not so indifferent as all that.

When a phonograph at the other end of the shop began to rattle off melodious tunes and funny jokes, in spite of the instructions he had received, off he pattered as fast as his little legs would carry him to investigate. After that, forgetful of everything else, finding himself caught in the constantly moving stream of Christmas shoppers, he was borne along until he found himself at last out upon the street—alone, free and independent.

It was great fun, at first. By and by, however, the afternoon waned; the sun, as if anxious to hurry along the dawn of Christmas day, sank early to bed; and the electric lights along the darkening highway began to pop out here and there like so many merry stars come down to earth to celebrate the gladest time of all the year. Little Billee began to grow tired; and then he thought of his mamma and tried to find the shop where he had promised to remain quiet until her return. Up and down the street he wandered until his little legs grew weary, but there was no sign of the shop, nor of the beloved face he was seeking.

Once again, and yet once again after that, did the little fellow traverse that crowded highway his tears getting harder and harder to keep back, and then—joy of joys—whom should he see walking slowly along the sidewalk but Santa Claus himself! The saint was strangely decorated with two queer looking boards, with big red letters on them, hung over his back and chest; but there was still that same kindly, gray-bearded mings, and the same dear old cap that face, the red cloak with the fur trim—the children's friend had always worn in the pictures of him that Little Billee had seen.

With a glad cry of happiness, Little Billee ran to meet the old fellow, and put his hand gently into that of the saint. He thought it very strange that Santa Claus's hand should be so red and cold and rough, and so chapped; but he was not in any mood to be critical. He had been face to face with a very disagreeable situation. Then, when things had seemed blackest to him, everything had come right again; and he was too glad to take more than passing notice of anything strange and odd.

Santa Claus, of course, would recognize him at once, and would know just how to take him back to his mamma at home—wherever that might be. Little Billee had never thought to inquire just where home was. All he knew was that it was a big gray stone house on a long street somewhere, with a tall iron railing in front of it, not far from the park.

"Howdidoo, Mr. Santa Claus " said Little Billee, as the other's hand unconsciously tightened over his own.

"Why, howdidoo, kiddo?" replied the old fellow, glancing down at his new-found friend, with surprise gleaming from his deep-set eyes. "Where did you drop from?"

"Oh, I'm out," said Little Billee bravely. "My mamma left me a little while ago while she went off about something, and I guess I got losted."

"Very likely," returned the old saint with a smile. "Little two-by-four fellers are apt to get losted when they start it on their own hook, specially days like these, with such crowds hustlin' around."

"But it's all right now," suggested Little Billee hopefully. "I'm found again, ain't I?"

"Oh, yes, indeedy, you're found all right, kiddie," Santa Claus agreed.

"And pretty soon you'll take me home again, won't you?" said the child.

"Surest thing you know," answered Santa Claus, looking down upon the bright but tired little face with a comforting smile. "What might your address be?"

"My what?" asked Little Billee.

"Your address?" repeated Santa Claus. "Where do you live?"

The answer was a ringing peal of childish laughter.

"As if you didn't know that!" cried Little Billee, giggling.

"Ha, ha!" laughed Santa Claus, "Can't fool you, can I? It would be funny if, after keeping my eye on you all these years since you was a baby I didn't know where you lived, eh?"

"Awfully funny," agreed Little Billee. "But tell me, Mr. Santa Claus, what sort of a boy do you think I have been?" he added with a shade of anxiety in his voice.

"Pretty good—pretty good," Santa Claus answered, turning in his steps and walking back again along the path he had just traveled—which Little Billee thought was rather a strange thing to do. "You've got more white marks than black ones—a good many more—a hundred and fifty times as many, kiddie. Fact is, you're all right—'way up among the good boys; though once or twice last summer, you know—"

"Yes, I know," said Little Billee meekly, "but I didn't mean to be naughty."

"That's just what I said to the bookkeeper," said Santa Claus, "and so we gave you a gray mark—half white and half black—that doesn't count either way, for or against you."

"Thank you sir," said Little Billee, much comforted.

"Don't mention it; you are very welcome, kiddie," said Santa Claus, giving the youngster's hand a gentle squeeze.

"Why do you call me 'kiddie' when you know my name is Little Billee?" asked the boy.

"Oh, that's what I call all good boys," explained Santa Claus. "You see, we divide them up into two kinds—the good boys and the naughty boys—and the good boys we call kiddies, and the naughty boys we call caddies, and there you are."

Just then Little Billee noticed for the first time the square boards that Santa Claus was wearing.

"What are you wearing those boards for, Mr. Santa Claus?" he asked.

If the lad had looked closely enough, he would have seen a very unhappy look come into the old man's face; but there was nothing of it in his answer.

"Oh, those are my new-fangled back and chest protectors, my lad," he replied. "Sometimes we have bitter winds blowing at Christmas, and I have to be ready for them. It wouldn't do for Santa Claus to come down with the sneezes at Christmas-time, you know—no, siree! This board in front keeps the wind off my chest, and the one behind keeps me from getting rheumatism in my back. They are a great protection against the weather."

"I'll have to tell my papa about them," said Little Billee, much impressed by the simplicity of this arrangement. "We have a glass board on the front of our ortymobile to keep the wind off Henry—he's our shuffler—but papa wears a fur coat, and sometimes he says the wind goes right through that. He'll be glad to know about these boards."

"I shouldn't wonder," smiled Santa Claus. "They aren't very becoming, but they are mighty useful. You might save up your pennies and give your papa a pair like 'em for his next Christmas."

Santa Claus laughed as he spoke; but there was a catch in his voice which little Billee was too young to notice.

"You've got letters printed there," said the boy, peering around in front of his companion. "What do they spell? You know I haven't learned to read yet."

"And why should you know how to read at your age?" said Santa Claus. "You're not more than——"

"Five last month," said Little Billee proudly. It was such a great age!

"My, as old as that?" cried Santa Claus. "Well, you are growing fast! Why, it don't seem more than yesterday that you was a pink-cheeked babby, and here you are big enough to be out alone! That's more than my little boy is able to do."

Santa Claus shivered slightly, and Little Billee was surprised to see a tear glistening in his eye.

"Why, have you got a little boy?" he asked.

"Yes, Little Billee," said the saint. "A poor, white-faced, little chap about a year older than you, who—well, never mind, kiddie—he's a kiddie, too—let's talk about something else, or I'll have icicles in my eyes."

"You didn't tell me what those letters on the boards spell," said Little Billee.

"'Merry Christmas to Everybody!'" said Santa Claus. "I have the words printed here so that everybody can see them; and if I miss wishing anybody a merry Christmas, he'll know I meant it just the same."

"You're awful kind, aren't you?" said Little Billee, squeezing his friend's hand affectionately. "It must make you very happy to be able to be so kind to everybody!"

Santa Claus made no reply to this remark, beyond giving a very deep sigh, which Little Billee chose to believe was evidence of a great inward content. They walked on now in silence for Little Billee was beginning to feel almost too tired to talk, and Santa Claus seemed to be thinking of something else. Finally, however, the little fellow spoke.

"I guess I'd like to go home now, Mr. Santa Claus," he said. "I'm tired, and I'm afraid my mamma will be wondering where I've gone to."

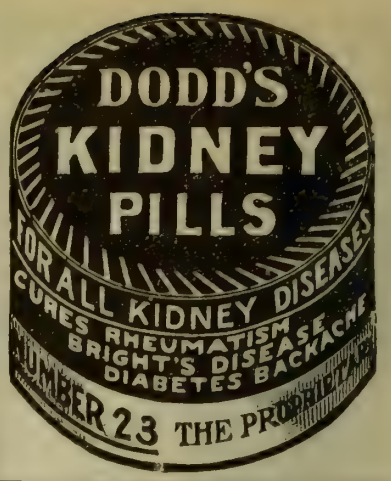
"That's so, my little man," said Santa Claus, stopping short in his walk up and down the block. "Your mother will be worried for a fact; and your father, too— I know how I'd feel if my little boy got losted and hadn't come home at dinner-time. I don't believe you know where you live, though—now honest! Come! 'Fess up, Billee, you don't know where you live, do you?"

"Why, yes, I do," said Little Billee. "It's in the big gray stone house with the iron fence in front of it, near the park."

"Oh, that's easy enough," laughed Santa Claus nervously. "Anybody could say he lived in a gray stone house with a fence around it, near the park; but you don't know what street it's on, nor the number, either, I'll bet fourteen wooden giraffes against a monkey on a stick!"

"No, I don't," said Little Billee frankly; "but I know the number of our ortymobile. It's—!N. Y.'"

"Fine!" laughed Santa Claus. "If



A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

Children Like It

It is not an easy matter to get a medicine that children like, or to force them to take one they don't like. Most mothers know that a cough medicine, while palatable, should contain no drug injurious to the child. The great popularity of

Chamberlain's Cough Remedy

is explained by the fact that it contains no opium or narcotic of any kind, and at the same time is so pleasant and agreeable to the taste that children like it. For this reason it is a favorite with the mothers of young children.

Yours for health,

—Granny Chamberlain

you really were lost, it would be a great help to know that; not being lost, as you ain't, why, of course, we can get along without it. It's queer you don't know your last name, though."

"I do, too, know my last name!" blurted Little Billee. "It's Billee. That's the last one they gave me, anyhow."

Santa Claus reflected for a moment, eyeing the child anxiously.

"I don't believe you even know your papa's name," he said.

"Yes, I do," said Little Billee indignantly. "His name is Mr. Harrison."

"Well, you are a smart little chap," cried Santa Claus gleefully. "You got it right the very first time, didn't you? I really didn't think you knew. But I don't believe you know where your papa keeps his bakeshop, where he makes all those nice cakes and cookies you eat."

Billee began to laugh again.

"You can't fool me, Santa Claus," he said. "I know my papa don't keep a bakeshop just as well as you do. My papa owns a bank."

"Splendid! Made of tin, I suppose, with a nice little hole at the top to drop pennies into?" said Santa Claus.

"No, it ain't either!" retorted Little Billee. "It's made of stone, and has more than a million windows in it. I went down there with my mamma to papa's office the other day, so I guess I ought to know."

"Well, I should say so" said Santa Claus. "Nobody better. By the way, Billee, what does your mamma call your papa? "Billee," like you?" he added.

"Oh, no, indeed," returned Little Billee. "She calls him papa, except once in a while when he's going away and then she says, 'Good-by, Tom.'"

"Fine again!" said Santa Claus, blowing upon his fingers, for, now that the sun had completely disappeared over in the west, it was getting very cold. "Thomas Harrison, banker," he muttered to himself. "What, with the telephone book and the city directory, I guess we can find our way home with Little Billee."

"Do you think we can go now, Mr. Santa Claus?" asked Little Billee, for the cold was beginning to cut through his little coat, and the sandman had started to scatter the sleepy seeds all around.

"Yes, sirree!" returned Santa Claus promptly. "Right away off now instantly at once! I'm afraid I can't get my reindeer here in time to take us up to the house, but we can go in the cars—hum! I don't know whether we can or not, come to think of it. Ah, do you happen to have ten cents in your pocket?" Santa added with an embarrased air. "You see, I've left my pocketbook in the sleigh with my toy-pack; and, besides, mine is only toy money, and they won't take that on the cars."

"I got twenty-fi' cents," said Little Billee proudly, as he dug his way down into his pocket and brought the shining silver piece to light. "You can have it, if you want it."

"Thank you," said Santa Claus, taking the proffered coin. "We'll start home right away; only come in here first, while I telephone to Santaville, telling the folks where I am."

He led the little fellow into a public telephone station, where he eagerly scanned the names in the book. At last it was found—"Thomas Harrison, seven-six-five-four Plaza." And then, in the seclusion of the telephone booth, Santa Claus sent the gladdest of all Christmas messages over the wire to two distracted parents:

"I have found your boy wandering in the street. He is safe, and I will bring him home right away."

Fifteen minutes later, there might have been seen the strange spectacle of a foot-sore Santa Claus leading a sleepy little boy up Fifth avenue to a cross street, which shall be nameless. The boy vainly endeavored to persuade his companion to "come in and meet mamma."

"No, Billee," the old man replied sadly, "I must hurry back. You see, kiddie, this is my busy day. Besides, I never go into a house except through the chimney. I wouldn't know how to behave, going in at a front door."

But it was not to be as Santa Claus willed, for Little Billee's papa and his mamma, and his brothers and sisters, and the butler and the housemaids, and two or three policemen, were waiting at the front door when they arrived.

"Aha!" said one of the police, seizing Santa Claus roughly by the arm. "We've landed you, all right! Where have you been with this boy?"

"You let him alone!" cried Little Billee, with more courage than he had ever expected to show in the presence of a policeman. "He's a friend of mine."

"That's right, officer," said Little Billee's father; "let him alone—I haven't entered any complaint against this man."

"But you want to look out for these fellers, Mr. Harrison," returned the officer. "First thing you know they'll be makin' a trade of this sort of thing."

"I'm no grafter!" retorted Santa Claus indignantly. I found the little chap wandering along the street and as soon as I was able to locate where he lived, I brought him home. That's all there is to it."

"He knew where I lived all along," laughed Little Billee, "only he pretended he didn't just to see if I knew."

"You see sir," said the officer "it won't do him any harm to let him

MILBURN'S

LAXA-LIVER PILLS

THEY NEVER FAIL TO DO GOOD.

Mrs. J. Shellsworth, Halifax, N.S., writes: "I take pleasure in writing you concerning the great value I have received by using your Milburn's Laxa-Liver Pills for a sluggish liver. When my liver got bad I would have severe headaches, but after using a couple of vials of your pills I have not been bothered with the headaches any more."

Milburn's Laxa-Liver Pills clean away all waste and poisonous matter from the system, and prevent as well as cure all complaints arising from a liver which has become inactive.

Milburn's Laxa-Liver Pills are 25c. a vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

VENO'S WON

"THE FRENCH PRIZE

For the Cure of

COUGHS AND BRONCHIAL TROUBLES

The hall-mark of scientific approval was conferred upon Veno's Lightning Cough Cure when it won the Grand Prix and Gold Medal at the International Health Exhibition, Paris, 1910; the approval of the public is expressed in a reputation wide as the British Empire. Veno's has the largest sale of its class in the world. It is made in Great Britain by British skill, financed by British capital, and sold wherever the British flag flies. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

cool his heels——"

"It is far better that he should warm them, officer," said Mr. Harrison kindly. "And he can do that here. Come in, my man," he added, turning to Santa Claus with a grateful smile. "Just for a minute, anyhow. Mrs. Harrison will wish to thank you for bringing our boy back to us. We have had a terrible afternoon."

"That's all right, sir," said Santa Claus modestly. "It wasn't anything, sir. I didn't really find him—it was him as found me, sir. He took me for the real thing, I guess."

Nevertheless, Santa Claus, led by Little Billee's persistent father, went into the house. Now that the boy could see him in the full glare of many electric lights, his furs did not seem the most gorgeous things in the world. When the flapping front of his red packet flew open, the child was surprised to see how ragged was the thin gray coat it covered; and as for the good old saint's comfortable stomach—strange to say it was not!

"I—I wish you all a merry Christmas," faltered Santa Claus; "but I really must be going, sir——"

"Nonsense!" cried Mr. Harrison. "Not until you have got rid of this chill, and——"

"I can't stay, sir," said Santa. "I'll lose my job if I do."

"Well, what if you do? I'll give you a better one," said the banker.

"I can't—I can't!" faltered the man. "—I—I've got a Little Billee of my own at home waitin' for me, sir. If I hadn't," he added fiercely, "do you suppose I'd be doin' this?" He pointed at the painted boards, and shuddered. "It's him as has kept me from—from the river!" he muttered hoarsely; and then this dispenser of happiness to so many millions of people all the world over sank into a chair, and, covering his face with his hands, wept like a child.

"I guess Santa Claus is tired, papa," said Little Billee, snuggling up closely to the old fellow and taking hold of his hand sympathetically. "He's been walkin' a lot today."

"Yes, my son," said Mr. Harrison gravely. "These are very busy times for Santa Claus, and I guess that, as he still has a hard night ahead of him, James had better ring up Henry and tell him to bring the car around right away, so that we may take him back—to his little boy. "We'll have to lend him a fur coat to keep the wind off, too, for it is a bitter night."

"Oh," said Little Billee, "I haven't told you about these boards he wears. He has 'em to keep the wind off, and they're fine, papa!" Little Billee pointed to the two sign boards which Santa Claus had leaned against the wall. "He says he uses 'em on cold nights," the lad went on. "They have writing on 'em, too. Do you know what it says"

"Yes," said Mr. Harrison, glancing at the boards. "It says 'If You Want a Good Christmas Dinner for a Quarter, Go to Smither's Cafe.'"

"Papa's trying to fool me, just as you did when you pretended not to know where I lived, Santa Claus," he said, looking up into the old fellow's face, his own countenance brimming over with mirth. "You mustn's think he can't read, though," the lad added hastily. "He's only joking."

"Oh, no, indeed, I shouldn't have thought that," replied Santa Claus, smiling through his tears.

"I've been joking, have I?" said Little Billee's papa. "Well, then, Mr. Billiam, suppose you inform me what it says."

"'Merry Christmas to Everybody,'" said Little Billee proudly. "I couldn't read it myself, but he told me what it said. He has it printed there so that if he misses saying it to anybody, they'll know he means it just the same."

"By jove, Mr. Santa Claus," cried Little Billee's papa, grasping the old man warmly by the hand, "I owe you ten million apologies! I haven't believed in you for many a long year; but now, sir, I take it all back. You do exist, and, by the great horn spoon you are the real thing!"

Little Billee had the satisfaction of acting as host to Santa Claus at a good, luscious dinner, which Santa Claus must have enjoyed very much, because, when explaining why he was so hungry, it came out that the poor old chap had been so busy all day that he had not had time to get any lunch—no not even one of those good dinners at Smither's cafe, to which Little Billee's father had jokingly referred. And after dinner Henry came with the automobile, and, idding everybody good night, Santa Claus and Little Billee's papa went out of the house together.

Christmas morning dawned, and Little Billee awoke from wonderful dreams of rich gifts, and of extraordinary adventures with his new-found friend, to find the reality quite as splendid as the dream things. Later, what was his delight when a small boy, not much older than himself—a pale, thin, but playful little fellow—arrived at the house to spend the day with him, bringing with him a letter from Santa Claus himself! This was what the letter said:

"Dear Little Billee:

"You must not tell anybody except your papa and mamma, but the little boy who brings you this letter is my little boy, and I am going to let you have him for a playfellow for Christmas day. Treat him kindly for his papa's sake, and if you think his papa is worth loving tell him so. Do not forget me, Little Billee, I shall see you often in the future, but I doubt if you will see me. I am not going to return to Twenty-third street again, but shall continue my work in the Land of Yule, in the Palace of Good Will, whose beautiful windows look out upon the homes of all good children.

"Good-by, Little Billee, and the happiest of happy Christmases to you and all of yours, affectionately.

"SANTA CLAUS."

When Little Billee's mamma read this to him that Christmas morning, a

stray little tear ran down her cheek and fell upon Little Billee's hand.

"Why, what are you crying for, mamma?" he asked.

"With happiness, my dear little son," his mother answered. "I was afraid yesterday that I might have lost my little boy forever, but now ——"

"You have an extra one thrown in for Christmas, haven't you?" said Little Billee, taking his new playmate by the hand. The visitor smiled back at him with a smile so swe t that anybody would have guessed that he was the son of Santa Claus.

As for the latter, Little Billee has not seen him again, but down at his father's bank there is a new messenger, named John, who has a voice so like Santa Claus's voice that whenever Little Billee goes down there in the motor to ride home at night with his papa, he runs into the bank and has a long talk with him, just for the pleasure of pretending that it is Santa Claus he is talking to. Indeed, the voice is so like that once a sudden and strange idea flashed across Little Billee's mind.

"Have you ever been on Twenty-third street, John?" he asked.

"Twenty-third street?" replied the messenger scratching his head as if it very much puzzled "what's that?"

"Why it's a street," said Little Billee rather vaguely.

"Well, to tell you the truth, Billee," said John. "I've heard tell of Twenty-third street, and they say it is a very beautiful and interesting spot. But, you know. I don't get much chance to travel. I've been too busy all my life to go abroad."

"Abroad!" roared Little Billee, grinning at John's utterly absurd mistake. "Why, Twenty-third street ain't abroad! It's uptown—near—oh, near, Twenty-second street."

"Really," returned John, evidently tremendously surprised. "Well, well, well! Who'd have thought that? Well if that's the case, some time when I get a week off I'll have to go and spend my vacation there!"

From which Little Billee concluded that his suspicion that John might be Santa Claus in disguise was entirely without foundation in fact.

FROST INJURY.—DIFFERENT WAYS IN WHICH APPLE TREES ARE AFFECTED

(Continued from page 148)

most part, took the form of trunk killing, the upper part of the trunk unprotected by snow being apparently dried out. The result was that the bark and cambium all around the trunk were killed. At Ottawa quite a number of trees was lost in this way. The reason, in our judgment, why the trunk was killed and the top uninjured was that the top had more moisture and was not dried out sufficiently to be killed. In past experience it has been noticed at Ottawa that sometimes the younger growth of apple trees will come through the winter uninjured, while the older parts of the branches will be killed. Trees in sod orchards will sometimes die from 'body killing' when those which are cultivated do not, the latter having more moisture. In a letter received from Mr. A. P. Stevenson, Morden, Man., he writes:—'Outside of sunscald, our chief winter injury is killing back. This is serious when the following winter conditions prevail: Light snowfall, high winds and extremely low temperature continuing for some time. Some varieties are killed to the snow-line. Two years ago we had a winter like that, and another seven years previous to that. The trees are simply frozen dry.' There have been some indications at Ottawa that body-killing or trunk injury has occurred under the veneer protector. This may have been due to ice held about the tree too long by the protector.

Two means of prevention of body-killing may be mentioned. One, to see that the trees have made vigorous growth the previous summer, not forgetting, however, to have the wood well ripened. The second is to plant windbreaks to check the force of the wind. In the Northwest the trunks are sometimes protected by sacking or veneer. It is even suggested by those who live in the West to make a box around the trunk with about six inches space and fill it with soil.

Killing of dormant buds.—While the killing of dormant buds evidently comes about partly from the same cause as body-killing, namely, a drying out in cold weather. it would seem that buds are more tender than wood, and their life is destroyed at certain minimum temperatures. Not only are fruit buds destroyed when the twig is not injured, but leaf buds as well. The buds being more exposed to the air may dry out when the wood does not. The buds of apples are not killed in Canada to the same extent as the buds of plums and cherries. In the province of Quebec and the colder parts of Ontario the buds of the European and Japanese plums and cherries are nearly always injured more or less in winter. This seems undoubtedly to be due to the drying out of the twigs, for when these fruits are grown near bodies of open water in winter they do well. The marked success of Mr. Aug. Dupuis, and others, in growing the European plums along the Lower St. Lawrence is well known. But what are the conditions there? It is only within a comparatively short distance of the river that these fruits succeed. When we get further back from the river the buds are killed as in other parts of the province. The reason of the suc-

High Blood Pressure

When your case becomes complicated and medicines fail, the doctor makes a test of the blood pressure, fearing that there may be something wrong with the condition of the kidneys and the action of the heart.

He realizes that when the kidneys fail to filter the poisons from the blood that there will be a hardening of the arteries, and when the pressure of blood comes on they will snap like so much deteriorated rubber-tubing—the result is a clot of blood on the brain, hemorrhage in the heart, or wherever the weak point may be.

But why allow this condition to be reached when you can so readily regulate the action of the liver and kidneys by using Dr. Chase's Kidney-Liver Pills.

Troubles of this nature have their beginning when, from over-eating or lack of exercise, the liver goes wrong, and throws an undue burden on the kidneys Headaches, biliousness, constipation and indigestion give due warning, and by the timely use of Dr. Chase's Kidney-Liver Pills there need be no further trouble.

The liver is awakened to action, the bowels regulated, and the kidneys strengthened in their all-important work by purifying the blood and thereby preventing pain and serious disease. This is the greatest of family medicines, because of the host of ills that are relieved and prevented by keeping the liver, kidneys and bowels healthy and active.

One pill a dose, 25 cents a box. All dealers, or Edmanson, Bates & Co., Limited, Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

C. R. B. BRYAN, Secretary.
Truro, N. S.

cessful culture of plums and cherries is evidently due to the fact that from the water there rises in winter a fog which blowing over the land keeps the air moist enough to save the buds from death. It will be remembered that it required dryness with cold to kill the roots of trees. When the roots were moist they were little injured, even if exposed to the same temperatures. There is, as yet, no very practicable way to prevent this drying out of the fruit buds. The fact that the parts of the trees which are under the snow produce fruit, when the parts which are exposed do not, suggests the plan of bending over the trees so that they will be covered, which has been done successfully by some growers. Another plan which we think deserves further experiment is low training of trees growing them with horizontal arms, for instance, which would be under the snow. A third plan is the breeding of varieties having hardier fruit buds. This we believe should, and is being done.

Winter-killing of swollen buds.—During winters with very changeable weather when some days are quite warm there is often a premature swelling of buds, especially of the cherry, plum and peach. These warm spells may be followed by cold weather, and there may be several such changes before spring. The buds being swollen and more or ess active are more subject to injury from frost and changes than the dormant buds and the result is that they are kiled. Apple buds do not swell readily and hence are seldom injured from this cause in Canada, except it may be in the prairie provinces, although just before the flowers open if there are severe frosts much injury may occur. Great injury is often caused in the peach districts by the kiling of swollen buds, and in the province of Quebec injury to the buds of plums and cherry is no doubt done when they are in this condition. It was long thought that if the ground could be kept frozen about the trees it would prevent the buds from swelling as the roots would thus be kept in an inactive condition, but it has been proved over and over again that this has no effect whatever in delaying the swelling of the buds. The expanding of the willow buds in our swamps before ice is gone is a good example of how buds will develop while the roots may yet be in a frozen condition. There is sufficient sap in the tree to supply the buds and even the leaves when they first expand and when the temperature about the top of the tree is high enough growth begins. Swelling of buds can be prevented by bending over the trees as suggested to prevent killing of dormant buds, but this could not very well be done on a large scale. A few years ago experiments were conducted at the Missouri station to determine if whitewashing the trees would retard the buds, the principle being used that white surfaces do not absorb heat as readily as darker ones. It was found that the whitewashing did retard the buds and in the case of peaches would sometimes prevent injury from frost. An experiment was tried at Ottawa in whitewashing plums and cherries, and it was found that it retarded the swelling of the buds. This means of prevention is not, however, a very practicable one as it is difficult to get the whitewash to cover the branches well for a long period. After further investigations at the Missouri station, it was found that the buds of varieties of peaches having the lightest coloured twigs required higher temperatures to cause them to swell than those with darker coloured twigs, and the former suffered less from killing than the latter. Not having in these lighter twigged varieties the kinds of peaches for commercial purposes the Missouri station is now at work breeding good varieties with light coloured twigs. It was also found at the Missouri station that the buds of peaches which matured their wood late did not swell as readily as those which were well ripened and thus were less liable to injury from frost.

Frost Injury to Flowers.

Apple flowers in bud will stand more frost than when they are fully open. When the petals fall less frost will cause injury than when the trees are in full bloom. From five to seven degrees Fahr. of frost are likely to cause severe injury to apples when in full bloom and after the bloom has fallen from four to five degrees may do much harm. Much depends on the length of time the flowers are frozen and on the weather following the freeze. If the flowers have been injured by frost, an examination after the petals are open, if the frost occurs when they are in bud, will reveal the centre of the flower or pistil discoloured or brownish. The fruit will not set when flowers are injured in this way. The frost may, however, come after pollination has taken place when the fruit may set.

Russeting of fruit Due to Frost

Sometimes frost affects the fruit when it is still quite small and later on the evidence of the injury will be a russeted area usually about the calyx end but sometimes at the stem end of the fruit and sometimes as a band of russet around the fruit. This, no doubt, is often attributed to some other cause than frost.

You are Losing More Money on Untapped Maple Trees Than You Make on Any Other Crop

Any farmer that has an untapp d maple grove is overlooking the biggest opportunity to make money on his farm. Every crop that you plant in the ground requires seed, fertilizing, ploughing, cultivating, cleaning and a number of other operations that take time and money. Too much dry, wet or cold weather may mean little or no crop.

Maple trees always produce a fair crop and they grow on land that is practically worthless for cultivation. They need no care of any kind yet each year produce more and are tapped at a season when you can not do any other kind of work.

Maple syrup and sugar now command the best prices in their history. If you have maple trees let us tell you how to make the most out of them with little time and effort.

Write us today for the fullest i formation.

(Continued from page 147)

in town. Morning sessions commence at 8.30, afternoon sessions at 1.30.

If a sufficient number of women or girls express the desire, the department will put on a longer course of from four to six weeks. Please state in your application your desires in this matter.

For the past three years the Annual Convention of the Womens' Institutes of Nova Scotia has been held during the second week of the January Short Course. It has been thought better to postpone the Convention until June, when it is believed a larger and more representative attendance will be secured.

Detailed programs of the short course will be prepared later, and may be procured on application to the undersigned.

M. CUMMING,
Principal
Agricultural College, Truro.
MISS JENNIE A. FRASER,
Superintendent,
Womens Institutes,
New Glasgow.

General Information for Men and Women

TUITION IS FREE. Students are admitted from every province of Canada and also from abroad on the same basis as those from Nova Scotia.

BOARD may be procured in Truro at from $4.50 to $7.00 per week. A list of boarding houses may be had on application but students are generally advised not to secure boarding houses until their arrival in town. Representatives from the College will meet the incoming trains and assist students in personally selecting boarding houses.

RAILWAY FARES. All railways in the Maritime Provinces grant a single fare on the Standard Certificate plan. **Buy a single fare ticket to Truro. Ask for a Standard Certificate which when signed at the College will entitle you to a free return home. You must buy this ticket at a station. You cannot get a Certificate on the train.** Understand that unless you bring a Standard Certificate you cannot secure the special rate. If you are not clear on this point **show this paragraph to your ticket agent.**

Attend if possible from the beginning to the end. If you cannot afford that length of time, make plans to attend for one or more days. Write for detailed time table and come on days when the subjects you are most interested in are taught.

For further information address
M. CUMMING, Principal,
Truro, Nova Scotia.

The Dominion Atlantic Railway offer a rate of 2c a mile one way mileage and will return free all students who attend all the sessions. Those who do not attend all the sessions will pay 1c per mile for return trip.

THE ANNUAL CONVENTION AND POTATO SHOW OF THE NEW BRUNSWICK POTATO GROWERS ASSOCIATION

At a meeting of the Executive Board of the New Brunswick Potato Growers Association, held on November 29th, it was decided to hold the second annual meeting of the Association in the Fisher Agricultural School at Woodstock on December 27th and 28th. In view of the success which attended the initial convention held last year, when nearly 200 potato growers attended, the Executive Board are looking forward to an increased interest being taken in this by the farmers who are finding potatoes to be such an important crop. The success which has attended the raising of potatoes has been attained by very little effort on the part of the growers and much more could be accomplished if the farmers were thoroughly organized for the purpose of studying this industry.

An extensive programme is being prepared and all phases of the potato industry will receive due consideration. Among the topics to be discussed, will be:—"Improvement of methods of cultivation with the hope of increasing the yield at a lessened cost"; "A discussion of the present fertilizer situation", laying particular emphasis on potash; "Selection of seed potatoes for the purpose of increasing the yield and improving the quality"; "Varieties of potatoes suitable for New Brunswick conditions", placing special emphasis on the necessity for raising one or two standard varieties which are high yielders and at the same time suitable for the domestic and foreign markets; "The importance of grading, standardizing and certifying table and seed potatoes"; "The present price and the possible price for seed potatoes in the spring, and the prospects for the crop of 1917". Addresses will also be given on potato diseases and general methods of handling the potato crop.

The Association is greatly indebted to the Potato Exchange for having made a donation of $300.00 to be used in furthering its work. This money will be spent on prizes, from $25.00 for first prizes, down to $1.00. All varieties may be exhibited, but particular attention will be paid to

Dept. 47 168 King St. East, TORONTO

the more popular and valuable commercial varieties such as Irish Cobblers, Green Mountains, Carman No. 1, Delawares, Cumming's Pride, and some of the less known varieties. Prizes will also be offered for the best collection of varieties and the best advertising displays.

The following exhibits will be displayed:—The Dominion Experimental Farms Agricultural Exhibition Exhibit; Varieties of potatoes by the Dominion Experimental Farms; Potato diseases by the Division of Botany, Dominion Experimental Farms; Potato machinery; exhibits by the manufacturers.

This is a potato growers meeting and those interested in potato growing cannot afford to stay away. Every problem will be discussed, including varieties, fertilizers, cultivation, diseases, and methods of improved marketing and standardization. Some of the best authorities in America will be present to address the convention.

Circulars will be distributed at an early date, including the prize list, and making suggestions on the methods of selecting potatoes for exhibiting. Anyone wishing further information in connection with the convention should write to the Secretary, G. C. Cunningham, Fredericton, N. B.

THE MARITIME POULTRY SHOW

(Continued from page 145)

Winners in Utility Breeding Pens

White Wyandottes—1, Mrs. C. W. Fawcett.

Silver Wyandottes—1, Mrs. Evans Kyle.

Buff Wyandottes—1, Wm. Beazley, Halifax, N. S.

Plymouth Rock—1, Albert Boswall.

Dorkings—1, John P. Bain; 2, Day Bros.

Rhode Island Reds, S. C.—1, E. C. Griffin, Port Williams, N. S.

White Leghorns—1, Mrs. C. W. Fawcett; 2, Victor G. Fuller, Amherst, N. S.

Any Other Variety—1, Day Bros.

Winners in Turkeys, Geese and Ducks

Bronze Turkey over 1 yr., male—1, W. J. Pickard; 2 and 3, J. Titus Barnes, Sussex, N. B.; 4, Albert Boswall.

Bronze Turkey over 1 yr., female—1, W. J. Pickard; 2, Albert Boswall; 3 and 4, J. Titus Barnes.

Bronze Turkey over 1916, male—1 and 2—J. Titus Barnes; 3, Albert Boswall.

Bronze Turkey over 1916, female—1 and 3, J. Titus Barnes; 2, Albert Boswall; 4, E. C. Griffin.

Turkeys A. O. V. over 1 yr., male—1, Albert Boswall.

Turkeys A. O. V. over 1 yr., female—1, Albert Boswall.

Turkeys A. O. V. 1916 female—1, Albert Boswall.

Geese Toulouse over 1 yr., male—1, Albert Boswall.

Geese Toulouse over 1 yr., female—1, Albert Boswall.

Geese Toulouss, 1916 male—1 and 2, Albert Boswall.

Geese Toulouse, 1916 female—1 and 2, Albert Boswall.

Geese Embden or Bremen, over 1 yr., male—1 and 2, Albert Boswall; 3, J. Titus Barnes.

Geese Embden or Bremen, over 1 yr. female—1 and 3, Albert Boswall; 2, J. Titus Barnes.

Geese Embden or Bremen, 1916 male—1, 3 and 4, Albert Boswall; 2, J. Titus Barnes.

Geese Embden or Bremen 1916 female—1, 3 and 4, Albert Boswall; 2, J. Titus Barnes.

Geese African, over 1 yr., male—1 and 4, J. Titus Barnes; 2, E. C. Griffin; 3, Albert Boswall.

Geese African, over 1 yr., female—1, E. C. Griffin; 2 and 4, J. Titus Barnes; 3, Albert Boswall.

Geese African, 1916 male—1, E. C. Griffin; 2 and 3, Albert Boswall.

Geese African, 1916 female—1, E. C. Griffin; 2 and 3, Albert Boswall.

Winners in Ducks.

Pekin Ducks over one year, male—1 and 2, Albert Boswall.

Pekin Ducks over one year, female—1 and 2, Albert Boswall.

Pekin Ducks 1916 male—1 and 2. Albert Boswall; 3, Home Industries Poultry Yards, Halifax, N. S.

Pekin Ducks 1916 female—1 and 2, Albert Boswall; 3, Home Industries Poultry Yards.

Rouen Ducks over one year, male—1, Albert Boswall.

Rouen Ducks over one year, female—1, Albert Boswall.

Rouen Ducks 1916 male—1 and 2, Albert Boswall; 3, Home Industries Poultry Yards.

Rouen Ducks 1916 female—1 and 2, Albert Boswall; 3, Home Industries Poultry Yards.

Indian Runner over one year male—1 and 2, Home Industries Poultry Yards.

Indian Runner over one year female—1 and 2, Home Industries Poultry Yards.

Ducks, A. O. V. over one year male—1 and 2, Albert Boswall; 3, J. L. Curran, Charlottetown.

Ducks, A. O. V. over one year female—1 and 2, Albert Boswall; 3, J. L. Curran.

Ducks, A. O. V. 1916 male—1 and 2, Albert Boswall.

Ducks, A. O. V. 1916 female—1 and 2, Albert Boswall.

Open Classes

Minorcas, Black R. C. cock—1, John P. Bain.

Minorcas, Black R. C. hen—1, John P. Bain.

Minorcas, Black R. C. pullet—1, John P. Bain.

Langshans, Black and White cock—1 and 2. Chas. H. Smyth.

Langshans, Black and White hen—1 and 2, Chas. H. Smyth.

Langshans, Black and White cockerel—1, O. J. Taylor, Moncton, N.B., 2, Chas. H. Smyth.

Langshans, Black and White pullet—1 and 2, O. J. Taylor; 3, Chas. H. Smyth.

Orpington, Buff, S. C. cock—1, Seaman & Stewart; 2, Home Industries Poultry Yards.

Orpington, Buff, S. C. hen—1 and 2, E. S. Tracey, Halifax, N. S.; 3, Seaman & Stewart.

PEDLARS
"SHAWA"
SHINGLES
DON'T wait until the muss of dripping ceilings and cracking, falling plaster forces you to reshingle. Get permanent freedom from leaking roofs before the damage is done. Pedlarize now with Pedlar's "Oshawa" Steel Shingles. Impossible for rain to trickle through. For Pedlar Shingles interlock on ALL FOUR SIDES, forming practically a single sheet of steel from eave to ridge. And Pedlar's "Oshawa" Shingles give you the beauty of expensive tile at a price, when laid, of that of a good wooden shingle roof. The "Right Roof" Booklet M explains the "Why" of safe roofing more fully. Write now for free copy.
THE PEDLAR PEOPLE LIMITED
(Established 1861)

Canada must 'Carry On'

If Belgium's Children Are To Be Saved - -

To punish the violation of Belgium and free its land from the Huns has been one of the strongest rallying cries of British and Canadians throughout this war. For it our men have fought hard and long, and, stronger and more determined now than ever, they are "Carrying on" to the finish.

When the soldiers first went out to fight the despoilers of Belgium, we who could not go undertook to help feed the starving women and children who were victims of German savagery. Are WE carrying on as the soldiers are doing? Or has our enthusiasm cooled—our sympathy died out—our help lessened or ceased?

Certainly the Belgians' need of help has not lessened, but rather increased! Three million women, children and old men are depending for food—for life itself—on the Belgian Relief Commission. The Commission in turn depends on us Canadians for a substantial share of the necessary food, or the money with which to buy it. If we fall short in our contributions, thousands of Belgian kiddies must go painfully, if not fatally, short in their food supply Already an alarming number of them, weakened by scanty rations, are falling victims to tuberculosis.

There would be little merit in restoring Belgium to a nation whose motherhood and youth we had allowed to be decimated and weakened by hunger and resulting disease Let us at home carry on the relief work as unselfishly, as steadfastly and as successfully as our soldier boys are carrying on the fighting! If YOU have not been helping, now is the time to give a hand and do your bit.

Send your subscriptions weekly, monthly or in one lump sum to Local or Provincial Committees, or

Winners of Special Prizes

Rhode Isand Red cup—E. C. Griffin, Port Williams.

Maritime Poultry & Pet Stock cup —Samuel Steeves, Sunny Brae.

Rhoades cup—C. B. Chapman, Amherst.

Kinsdale cup—Kent Poultry Yards.

National W. Wyandotte cup—Samuel Sttves, Sunny Brae.

Dressed Poultry

Best 2 Orpington cockerels—2 and 3, Seaman & Stewart, Monctin. (First pize not awarded).

Best 2 R. I. Red cockerels—1 and 3, Seaman & Stewart. (Second not awarded).

Best 2 cockerels, any breed—2 and 3, Seaman & Stewart. (First not awarded).

Best 6 chickens, any variety—(First not awarded); 2, Seaman & Stewart.

Eggs—1, R. Carter; 2, Walker & McMullin.

The show as a whole was very creditable and well worth seeing, but the citizens of Moncton and the public generally did not exert themselves to a very great extent to see the display. The attendance was ridiculously slim and not at all encouraging for those who put so much time and energy into the work of making the show. We'll all be glad to get back to Amherst.

STANDARDS FOR CANADIAN EGGS

The Poultry Branch of the Live Stock Division, Ottawa, had representatives at the Poultry Show to demonstrate to the public "The Standard for Candian Eggs, adopted by the Canadian Produce Association.

Classes:—Fresh Gathered, Storage, Cracked and Dirties.

Grades:—Specials; Extras, No. 1's, No. 2's; Extras No's 1, No. 2's; No. 1's, No. 2's.

Allowance for deterioration in transit 10 per cent, but none bad, i. e., Eggs should grade at point of delivery 90 per cent, of grade named at point of shipment.

***Definition of Grades**

Specials—Eggs of uniform size weighing over 24 ozs. to the dozen or over 45 lbs. net to the 30 doz. case; absolutely clean, strong and sound in shell: air cell small, not over 3-16 of an inch in depth; white of egg to be firm and clear and yolk dimly visible; free from blood clots.

Extras—Eggs of good size, weighing at least 24 ozs. to the dozen or 45 lbs. net to the 30 doz. case; clean; sound in shell; air cell less than 3-8 inch in depth; white of egg to be firm and yolk slightly visible.

No. 1's—Eggs weighing at least 23 ozs. to the dozen or 43 lbs. net to the 30 doz. case; clean; sound in shell; air cell less than ½ inch in depth; white of egg to be reasonably firm; yolk may be quite visible but mobile, not stuck to the shell or seriously out of place; air cell not necessarily stationary.

No. 2's—Eggs clean; sound in shell; may contain weak watery eggs and eggs with heavy yolks, and all other eggs sound in shell and fit for food.

*Definitions of grades in class Cracked and Dirties to be same as for grades in Fresh Gathered class except that the terms referring to soundness and cleanness are not to apply.

OFFICERS OF THE MARITIME POULTRY ASSOCIATION FOR 1917.

Sec.-Treas.—J. P. Landry, Truro

Prize List Committee—A. F. Houston, Charlottetown, P. E. I.; Seth Jones, Sussex, N. B. and J. P. Landry, Truro, N. S.

TRAINING THE COLT

We never have any trouble in training our colts. We begin about January 1, using a bitting harness to accustom them to the bit. This harness consists of an open bridle with check, a surcingle with crupper attached and side reins running from the sides of the surcingle to the bit. We turn them out in the yard with this harness on for an hour or more each day for five or six days. We leave the check and side reins loose at first, taking them up a little each day.

Next, we hitch them up with a gentle, obedient, fast-walking horse, driving them on the off side for a few times and then on the near side for a few times. We drive them to town, to the neighbors, haul straw and do other light jobs, and by the time for spring work they are well broken and in good condition to stand the work. We have broken from two to four colts by this method each winter for several years with good result.—J. McP.

The Dominion Experimental Farm, Nappan, N. S., had an instructive display of model modern poultry appliances at the recent Maritime Poultry Show. Mr. W. W. Baird, the popular and efficient superintendent of the farm was in charge of the dispay. He and his assistant, Mr. Bert Robertson explained the merits of the various devices and the benefits to be derived from practising modern methods.

The placards connected with the display set forth some of the truths of poultrydom.

Water is cheap, supply it li' erally.

Dispose of non-producers.

Market your old hens as soon as the breeding season is over.

An old hen will make more broth than profit.

A high price for water.—In selling eggs for 40 cents per dozen, we are getting 25 cents per pound for water. Give hens lots of water.

A flock of 100 hens properly cared for will pay the rent on an average 100 acre farm.

Don't allow every member of your family to look after the hens. Make one person responsible and you will have better results.

Give the boy or girl the management of the poultry plant. It will make a better man or woman and a more profitable plant.

To get winter eggs—Early pullets of a laying strain in clean, bright houses before cold weather. Proper feed, fed so as to keep them active.

Get a good factory—The high cost of feed emphasizes this fact that only early pullets should be kept.

Don't keep old hens. Hen decrease each year 25 per cent in egg production. Keep the early pullets for winter eggs and the one-year-old hens for breeding. This means high priced eggs and strong vigorous chicks.

The display contained a model permanent colony house, a portable colony house, model appliances for feed, trapnests, etc. and cartons such as are used for the marketing of eggs for hatching, guaranteed eggs and broilers.

The factory referred to in a preceding paragraph was represented by two coops. In one there was an early hatched pullet—hatched about April 1st that laid 126 eggs. 100 hens like this one would give a yearly profit of $121.00, after feed bill is paid.

The pullet in the other coop was hatched May 15th and laid fifty eggs. 100 hens like this one would give a loss of $100.00. The comparison is obvious. "Keep only early pullets".

Samples of the various poultry foods in quantites required by individual birds was also shown.

THE
Air-O-Lantern
Gives 300 Candle Power Light
As bright as a City street light. Carry it anywhere, in any weather. Set it down in hay. Knock it over; quite safe, can't explode can't start a fire. Burns 90% air and 10% gasoline. One filling burns 12 hours. The best of all lights for outdoors. Cheapest in the end.
FOR INDOORS, USE
AIR-O-LITE
Safest, Brightest, Cheapest Light.
All the advantages of the Air-O-Lantern, and beauty besides. A handsome lamp for any room. Absolutely no danger of fire or explosion. Clean—no wicks to trim. Write for FREE catalogue and full details of special "Direct to you" offer. Address,

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

TEN Shorthorn Bulls for sale. — WALTER EATON, Upper Canard, N. S.

FOR SALE—Choice White Orpington Cockerels from Owen Farms, best pens.—MOUNT PLEASANT POULTRY YARDS, 62 Paras St., St. John. N. B.

FOR SALE—Registered two-year-old Clydesdale Stallion, price moderate. — LENNOX NAPIER, Lower Woodstock, N. B.

FOR SALE—Pure Bred Dorset Ram Lambs. These are sturdy fellows at bargain prices to head your flock. E. A. Howlett, Lake Edward, N. B.

FOR SALE—Registered Berkshire Bore, eighteen months old. C. A. Borden, Scheffield Mills Nova Scotia.

FOR SALE—Hampshire Sheep, both sexes also some males and females of any of the popular breeds. All good stock.—CEPHAS NUNN, Winsloe, P. E. I.

WOULD YOU MARRY IF SUITED? Best matrimonial paper published. Mailed FREE.—THE CORRESPONDENT, Toledo, Ohio.

FOR SALE.—One pure bred Cheviot Ram, 3 years old, and one pure bred Cheviot Ram Lamb.—J. H. NICOL, West Bathurst, N. B.

PORTRAIT AGENTS WANTED.—Send for catalogue. Solar and bromide prints, portraits flax and convex, frames and war pictures.—MERCHANTS PORTRAIT CO., Toronto.

FOR SALE—Ayrshire Bulls and Heifers, from one week to two years. Registered Clydesdale Stallions and Mares - John A. Hughes, Petitcodiac, N. B.

LADIES to do plain and light sewing at home, whole or spare time; good pay; work sent any distance, charges prepaid. Send stamp for particulars to NATIONAL MFG. COMPANY, Montreal.

FARMERS DON'T MISS THIS—I have a few of the wonderful Aladdin Coal Oil Lamps left which I am offering at very low prices. Write for full particulars. Address E. H. SMITH, Nauwigewauk, N B.

FOR SALE—Fifteen pairs of Buff Leghorns' cockerel and pullets, $2.50. By a $15 00 sire' Two White Wyandotte, two R. I. Reds and one White Leghorn Cockerels, $1.25 each, or would exchange some for pure bred Barred Rocks or R. I. Red Pullets.—G. M. PECK, Wolfville, N S.

TROTTER FOR SALE—Handsome Black Gelding, young and kind; not afraid of anything; a fast trotter with lots of action. Safe for a lady to drive. An extra good ice hors . Would exchange for a heavy express horse.—A. M. WILSON, Erskine St . Dartmouth, N. S.

950-Acre Farm $4500

Owner called to another state by urgent business sacrifices 130 acres in cultivation, corn, grain, clover and potatoes, 100 apple trees, 300 acre pasture. Estimated a million feet of oak, beech, white birch, maple, pine, etc. Will cut thousands of cords of wood worth $5 a cord in nearby local markets. Equipped saw mill, doing paying custom business; neat comfortable cottage house, basement barn, hen house and wagon house. If taken now owner includes pair horses, 4 cows, 2 hogs, poultry, mowing machines, plows, harrows, cultivators, corn planter, steam engine, corn husker and shredder, threshing machine, power wood saw, hydraulic cider mill, grain reaper, cream separator, wagons, sleds, 4 sets harnesses, house furniture and a lot of apples, potatoes, corn, oats and hay. $4500 takes all. Part down and easy terms. For details see page 6 "Peace and Plenty Catalogue" filled with farm bargains in a dozen states. Write today for your free copy — E. A. STROUT FARM AGENCY, Dept 2612, 294 Washington Street, Boston, Mass.

Fir Shade Farm Dual-Purpose Shorthorns !

Several years ago I imported from Ontario three Dual-Purpose Shorthorn animals, and now have in my stable at Rothesay eight representatives of this breed. Two of the females are entered in the Record of Performance, and so far have done excellent work. If you feel disposed you might drop in and see these the first time you are in the vicinity. Perhaps some time when you are coming to the city you would let me know, when I could arrange to go to Rothesay with you.

P. R. L. FAIRWEATHER. St. John, N. B.

OPPORTUNITY

Owing to not getting a new poultry house built as expected, we are forced to sell about 50 pullets in Barred Rocks and White Leghorns. Also a few more yearling hens and several choice Cockerels.

If interested write,

ORCHARD HILL FARM,
Brown's Flats, N. B.

NOTICE

TO OUR CUSTOMERS

CONSIDERING the present cost of material, wire fencing is sold at very low prices. Had we to buy on present market, fence would have to be sold for 25% higher than our present prices.

For the immediate present we are selling fence for cash, direct to the user, at old prices. We cannot, at this writing, state how long we can do this. We would strongly advise our customers to cover their fence requirements in the near future.

The Maritime Farmer
SUSSEX, N. B.

ILLUSTRATION STATIONS IN CANADA

The Department of Agriculture of the Dominion Government is carrying on Illustration work in crop production and cultural methods with farmers in the provinces of Quebec, Alberta and Saskatchewan.

Farmers owning or operating land favourably situated for the carrying on of such work co-operate with the Department.

The farmer puts under the direction of an officer of the Dominion Experimental Farms System, a part of his farm having a good wide frontage on a well travelled highway, each field having the same frontage along the same highway, so that the crops and cultivation are unavoidably in evidence to the casual traveller and easily inspected by the interested visitor.

The Department, for the first year at least, furnishes the seed necessary to sow such of the fields as it is decided to put under crop that year. In subsequent years the farmer saves enough of the best of the crop grown on these fields to do the necessary seeding. This, of course, provided the grain produced is satisfactory as to purity and germinative power.

All cultural and harvesting operations in connection with these fields, i. e., the ploughing, harrowing, etc., of the fields and the sowing, harvesting and threshing of the grain therefrom are done by the farmer. All work indicated above is done in exactly such ways and at exactly such times as directed by the Illustration Station Division of the Dominion Experimental Farms System. The farmer keeps a record of the amount of time taken to perform the different operations on each field and threshes the grain harvested separately so that it will be known how much is harvested from each field.

The records just mentioned of the work and crops resulting, together with brief notes made each week, are duly entered on blank forms provided for that purpose. The work of making such notes and entering up the work done on each field does not entail more than one hour's work each month. Each week the farmer mails to the Central Experimental farm, Ottawa, a form filled out with full particulars as to the work done, general weather conditions and crop progress on the different fields. The farmer permits to be placed in front of each field a sign stating briefly the method of preparing the land for the crop growing thereon, or the treatment given the plot that year.

On all these farms, whether located in the Province of Quebec, or in Saskatchewan or Alberta, systematic rotations of crops suitable to the district served as well as the best cultural methods and most suitable varieties of crops are being demonstrated.

THE NEW BRUNSWICK FARMERS' AND DAIRYMEN'S 1917 CONVENTION

The executive of the New Brunswick Farmers' and Dairymen's Association have issued their call to their 1917 annual meeting.

The convention will be held in Fredericton. The programme will commence on Tuesday morning, January 30th in the Opera House, and will include addresses and discussions on Sheep Raising, Potato Growing and Pork Raising.

The Annual Provincial Seed Fair, which is now recognized as one of the big features of the Convention will be held during the morning and afternoon of the 31st, in the gymasium of the Provincial Normal school, where every body can be comfortable and examine the exhibits to the best advantage.

The Wednesday evening session will be devoted to addresses along patriotic lines. It is hoped Hon. Martin Burrell will be the chief speaker.

On Thursday, February 1st, Poultry raising and Dairying will be the chief topic.

On Friday everybody will go to the Experimental Farm to spend the day in profitable discussion, and to get in closer touch with what the Experimental Farm is planning and doing to help the farmers of the province in overcoming the problems that confront them.

The seed fair prize list is now ready for distribution. If you have not yet received a copy, send for one to J. B. Daggett, Secretary for Agriculture, Fredericton. Look it over, then get some seed ready and make your entries early. You will find it a big incentive to do more and better work in seed selection and grading, and this in turn will mean bigger crop yields for you.

The president of the Association is Mr. Geo. E. Fisher, Chatham—a business man and enthusiastic farmer. His slogan for 1916-17 is 1000 members. Are you one of the number? If not, plan to be in Fredericton on the convention dates and join with your fellow farmers in their annual parliament.

Work is planned on some farms so that it is done by half as many horses as some other farms keep for the same purposes. It is a sign of poor farming to have a lot of idle horses about.

Remember that lice live in filth, therefore to prevent re-infection after the lice are once killed, all litter in barns and yards must be burned, and the buildings thoroughly disinfected.

Eeternal vigilance is the price of good service.—Publicity Magazine.

Nervous Headache

Pain is a blessing in disguise.

It is Nature's danger signal to warn you that there is something wrong in the system.

While headache may result from a variety of causes, it most frequently denotes a starved condition of the nerves.

The brain is the headquarters or "central" of the nervous system. Here nerve force is consumed at an enormous rate. If there is any lack of rich, red blood from which to form new nervous energy the brain is first to feel it and the head aches.

Headaches may be stopped by powerful drugs, but that is like breaking the semaphore which warns the engineer of danger.

The only wise way is to increase the amount of rich, red blood in the human body by using Dr. Chase's Nerve Food, and thereby feed the starved nerves back to health and vigor.

Not only will the headaches disappear, but you will sleep well, feel well and gradually regain strength and confidence. The Nerve Food will sharpen the appetite, improve digestion and build up the whole system.

In this way the headache will prove a blessing. It has warned you of approaching nervous collapse while yet there is a foundation on which to build good health.

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Conserve Breeding Herds and Flocks

Save the Heifer Calves

The Maritime Farmer has deplored, on many occasions, the slaughter of young calves that is so common in the dairy districts of the Maritime Provinces.

Economy should be the watchword of every citizen during the strenuous times through which our empire is now passing.

The conservation of every available food source should be recognized.

Live stock is acknowledged by our foremost authorities to be the backbone of a sure and sane system of agriculture for the Maritime Provinces.

Present indications point to a great scarcity of horned cattle and a big demand for same at the conclusion of the war.

The slaughter of young calves and immature meat animals of all kinds is wilful waste—wilful waste if continued brings woeful want.

The present high prices for meats of all kind actually mean a woeful want. It spells scarcity and scarcity leads on to famine unless some measures are taken to conserve and foster supplies.

In some parts of England farmers and legislators have worked together to enact a law prohibiting the slaughter of calves under a certain age. A young calf when slaughtered at birth is slugged veal of inferior food value. The calf reared to several months and well fed will produce a large quantity of good veal. The possibility is there and it is a crying shame to destroy it. Moreover the finished product is of more value to the farmer.

We do not for a moment claim that heifer calves from inferior milkers should be reared to take their place in the dairy. We do, however, claim that instead of being slaughtered at birth, they should be reared to the age when they could be profitably slaughtered for beef.

Prof. M. Cumming of the N. S. A. C., Truro, has submitted for discussion in the public press the following communication from the Montreal Board of Trade.

"I have the honor to inform you "that the question of the steadily de-"creasing numbers of Live Stock in "Canada, and scarcity of Hides, has re-"ceived the attention of the Council of "this Board, and after very careful "consideration it desires to make the "following recommendation to you:

"That legislation be enacted, to re-"main ecective for the duration of the "war and for one year thereafter (1) "prohibiting the slaughter of female "cattle and sheep under the ages of "eight and five years respectively, ex-"cept under the authority of the De-"partment of Agriculture.

Canadian Fruit Being Sold by Auction in Great Britain

"The prohibition of the slaughter of "male calves under one month old is "recommended because the hide of a "calf less than one month old is not of "much use and the meat is of doubtful "value.

"The Council further recommends "that seriously consider whether it "might not be advisable to prohibit "the exportation of female live stock "under such ages as you may deem "necessary. This action on the part "of the Government would have the ef-"fect not only of preserving our herds "and flocks, but also of keping within "the country the various by-products, "such as fats, hides, etc., and so tend "to keep the prices for these products, "all of which are advancing rapidly, "within reasonable bounds, thus as-"sisting in some measure in keeping "down the cost of living, which is pres-"sing so heavily on many classes of "our population."

Dairymen who produce winter milk, plan to have a large percentage of their cows freshen during the fall and early winter. Other dairymen plan to produce most of their milk in summer and in such cases, the spring months bring the greater percentage of calves to their herds. Then there is another class of dairymen who plan to keep up a fairly uniform milk flow throughout the year and in order to do so they plan to have cows freshen occasionally so that when one cow is drying off another is coming into full flow to take her place. As a sane business proposition we believe the system that calls for a steady income throughout the four seasons is the most desirable.

The system that calls for milk production only in summer is antiquated. The cows are idle too much of their time and it has been proven repeatedly that the spring reared calf costs more to bring it to the producing stage than does the fall reared calf.

The advocate of winter dairying, however, claim they can give their cows more attention during the winter season than they can in the busy summer season. Records show that fall calved cows give an abundant flow of milk when prices are high and when they are pretty well along in lactation and their flow is diminishing the rich pasture grasses gives their milk producing proclitivies a new lease of life and consequently they will produce more milk in one year than under any other system.

The failure of the potato crop in so many of the large growing centres last summer caused a scarcity that sent prices skyward. Consequently there was an increased demand for turnips and they too soared in prices to such an extent that many dairymen, who had large quantities could not resist the temptation to sell. Some dairymen did not have foresight enough to retain enough for the use of their dairy herds. Mill feeds of all kinds are high and hard to get, and as a consequence some dairymen have decreased their herds. We believe fewer cows are being milked this winter in our foremost dairy sections than there have been for several years, despite that milk prices have advanced from 25 to 50 per cent.

We hear some farmers say: What then is the use of talking the rearing of calves when milk cream, butter and cheese are so much in demand and at record prices?

We say it because we believe that the farmer who plans to rear as many heifers as he possibly can, will reap a rich reward for his abors during the next five or ten years.

Maintenance of the herd by purchasing cows not conductive to economical herd improvement.—The maintaining of a dairy herd is one of the difficult problems that constantly confronts every milk producer. In a great many instances, the herds are maintained by buying cows on the general market or from breeders who are less fortunately situated in regard to the disposal of their product as whole milk, and who, for this reason, use the skim milk available for the growing of heifers. Aside from the breeder of pure-bred cattle, it is only occasionally that a dairyman is sufficiently interested in his herd to rear his own cows. Under existing conditions, there is a constant demand for dairy cows of profitable production or of improved breeding and the value of such animals is often much higher than the actual cost of producing them.

The cows sold on the open market are usually produced by dairymen who have skim milk available for the growing of calves. Many dairymen who dispose of their product as whole milk would gladly increase the size of their herd or improve its quality if it were possible for them to do so economically. The prices which are being paid for grade cows are sufficient proof of the extent of the demand. The practice of buying cows into the herd, under average conditions, is not conductive to increased production. The cows which are offered for sale are often very inferior animals. They are available because the owners appreciate the value of records and dispose of their cows as soon as they fail to yield a profit, or they are handled by professional cow buyers who sell their animals as soon as they decline in production. This practice prevails, although many of

their cows may be fair individuals from the standpoint of dairy conformation.

The Raising of Heifers has many advantages.—The dairyman who keeps individual records, who breeds the cows that show profitable production, to bulls of desirable ancentry, and raises the heifer calves from these cows, is following a system of maintaining his herd that promises the greatest and surest possibiities for herd improvement and increased production. Dairymen, who are using grade cows exclusively, may apply this method of herd improvement with practically the same assurance of success as the breeder of pure-bred stock.

The influence of a sire of known breeding, when mated with cows of profitable production, insures offspring of like characteristics. The practice of raising his own heifers assists the dairyman in protecting his herd against animals harboring germs of communicable diseases and in guarding the consumer against the dangers of unsafe milk. Aside from yielding a product that may jeopardize the health of the consuming public, unsound cows are also undesirable because they are not in a condition to do justice to their milk-producing ability, causing decreased production.

Scarcity and Market Value of Skim Milk as a Human Food.—The advantages to the dairyman of producing his own cows as above set forth are counteracted, to no small extent, by the difficulties of producing them economically under existing conditions. The demand for whole milk is increasing from year to year, both as a product for direct consumption in cities and towns and for the manufacture of condensed milk and cheese. Skim milk is, therfeore, not available on a large number of farms as a feed for raising calves, and, although it is considered as ranking next to whole milk for this purpose, it is impractical to recommend its universal use.

There are several mlk substitutes for calf feeding on the market, some of which are used very extensively. Doubtless, in many instances, their value is xceedingly high for this purpose. As the demand for whole milk increases, the extensive use of these materials must necessarily follow. A calf meal that will successfully take the place of skim milk as a feed for calves will do much toward increasing the cow population of our country and to encourage the dairymen to develop their herds in accordance with the best principles of breeding, which is a more desirable practice than that of depending upon buying cows from unknown sources.

Convention and Potato Show of the N. B. Potato Growers' Ass'n

The annual Convention of the New Brunswick Potato Growers' Association was held in the Fisher Vocational School at Woodstock on December 27th and 28th, 1916. The initial Potato Show of the Association was also held simultaneously with the Convention. A large number of potatoes from different sections of the Province were exhibited in the several classes, some of the stock which carried off the larger of the prizes, being exceptionally fine. The New Brunswick Potato Exchange made a donation of $300.00 to the Association, to be used as a prize fund; this donation enabled the Secretary to prepare quite an extensive prize list.

The prize money was all awarded, with the exception of the 7th, 8th, 9th and 10th prizes in Class III, and the 4th prize in Class VIII. Exhibitors from York Co. took $87.50, from Carleton Co. $66.50, from Northumberland Co. $60.00, from King's Co. $41.00, and from Victoria Co. $37.50. The exhibits were judged by Mr. S. J. Moore, Representative of the Dominion Seed Branch, of Truro, N. S. and Mr. J. A. Clark, Superintendent, Dominion Experimental Station, Charlottetown, P. E. I.

The Dominion Experimental Farms Exhibition Exhibit was also displayed, together with 60 varieties of potatoes which were grown at the Experimental Station, Fredericton. Much interest was evinced in this display, the Hall where it was set up being the centre of much animated discussion during the two days of the Convention.

The first session of the Convention opened at 2.00 p. m., December 27th, the President, Mr. T. W. Caldwell of Florenceville presiding. After the minutes of the previous Convention and the Constitution and Bye-Laws of the Association had been read by the Acting Secretary, the President gave his address, which will be published in next issue.

At the conclusion of this address, the President appointed the following committees:—

Nominating Committee,—Mr. W. W. Hubbard, Fredericton, Chairman; Mr. A. D. McCain, Florenceville; Mr. A. A. H. Margison, East Centreville; Mr. W. E. Palmer, Scotch Lake; Mr. G. C. Cunningham, Fredericton.

Membership Committee,—Mr. James Bremner, Jr., Chatham, Chairman; Mr. W. E. Palmer, Scotch Lake; Mr. C. M. Shaw, Hartland; Mr. J. E. Porter, Andover; Mr. L. Estey, Woodstock; Mr. T. A. Goggin, Elgin; Mr. C. Fred Fawcett, Upper Sackville.

The second address was given by Professor W. S. Blair, Superintendent, Dominion Experimental Station, Kentville, N. S., on "The Importance of Planting Vigorous Seed Stock" and a report on co-operative tests conducted by agricultural societies. The speaker, by producing figures showing the results of these tests, emphasized the great importance of every grower ascertaining whether his stock is giving the best results. This can best be ascertained by taking part in co-operative tests, different growers planting samples of their stock side by side under uniform treatment and conditions and carefully noting the results obtained.

New Fumigation and Inspection Station, Niagara Falls, Ont.

The next address was given by Mr. C. Fred Fawcett of Upper Sackville, on "Successful Methods of Potato Selection." Mr. Fawcett has practised seed selection for a number of years and has met with much success in the production of a fine class of seed stock. He gave an interesting account of the methods employed by him in carrying on this work.

A discussion on this address, entitled "Shall we endeavour to eliminate all varieties except those of the Green Mountain and Irish Cobbler groups" was led by Mr. S. J. Moore and taken part in very enthusiastically by a number of the audience.

The session closed at 5.00 p. m. There were 134 members and delegates present.

The second session opened at 8.00 p. m., Mr. A. D. Holyoke of Woodstock in the chair. The chairman said that, while not a farmer himself, yet as a former secretary of the local agricultural society, he took a great interest in agricultural matters and it gave him satisfaction to know that such a splendid organization as the New Brunswick Potato Growers' Association promised to be, had come into existence. He added that he believed in unity in all things and if the potato growers of this Province would come to realize that "Union is Strength" and do everything possible to further the work that the Association has pledged itself to perform, he predicted a bright future for the potato industry of New Brunswick.

The President next addressed the meeting on "The Canadian Potato Industry" and gave figures to show that Canada occupies an important place among the potato growing countries of the world. He also expressed the opinion that much greater production ought to be secured, not necessarily by increased acreage, but by more improved methods of seed selection, cultivation, and control of disease.

Mr. J. A. Clark, Superintendent, Dominion Experimental Station, Charlottetown, P. E. I. next gave an address on "The Relation of the Potato Industry to General Agriculture." Mr. Clark, in the course of his address, gave full details of the cost of raising an acre of potatoes, and by basing his figures on the actual cost of labour and materials in 1916 and the price obtained for potatoes, he showed that, allowing a liberal margin for every contingency, potato growing was still a profitable business.

There were 83 present at this session. The session closed at 10.15 p. m. with the singing of the National Anthem.

The third session opened at 9.00 a. m., December 28th, the President in the chair.

The first address was given by Mr. Paul A. Murphy, Dominion Plant Pathologist for P. E. I. and N. S., on "Potato Diseases and their Control." Mr. Murphy explained some of the more serious diseases, particularly Black-leg and Mosaic, and emphasized the necessity for eliminating at planting time, all tubers showing the slightest traces of disease, discolouration, cuts or bruises.

The next address was given by Mr. George Partridge, Dominion Plant Disease Inspector, Fredericton, on "Late Blight or Rust and its Control by Spraying." The speaker outlined the loss which is annually caused by the ravages of this disease, stating that in 1915 the estimated loss to the possible crop in New Brunswick was 25%, or 3,000,000 bushels; a loss from a financial standpoint of $1,500,000. He produced results of experimental work in spraying with Bordeaux Mixture which has been carried on during the past two seasons in different parts of New Brunswick and Quebec, under the supervision of the Dominion Plant Pathological Laboratory at Fredericton. These figures obtained from a thorough and systematic use of Bordeaux Mixture (4 lbs. Copper Sulphate, 4 lbs. Lime, 40 gals. Water) for the control of Late Blight, in some instances an increase in yield

of 100% having been obtained.

A discussion on this address was then opened and led by Mr. A. A. H. Margison of East Centreville, and Mr. W. E. Palmer of Scotch Lake. Both these gentlemen are successful potato growers and produced figures of results which they have obtained from experiments carried on by them on their own farms, experiments which have proved to their satisfaction that to be reasonably sure of obtaining a good yield of potatoes, the use of Bordeaux Mixture is advisable.

Mr. G. C. Cunningham, Secretary of the Association and Dominion Plant Pathologist for New Brunswick and Quebec also addressed the meeting on the subject of potato diseases. He said that at a previous meeting he had heard statements made that the average production per acre of potatoes in New Brunswick was 100 barrels, but he considered this to be a very high estimate, for while some individual growers might be producing more than 100 barrels per acre yet on the majority of farms the yield was much smaller than this figure. This was due to a large extent to the prevalence of disease, more especially Black-leg, Rhizoctonia, Mosaic and Late Blight. These four diseases caused annually a loss of from 45% to 50% of the total possible crop in the Province, or nearly 6,000,000 bushels. He therefore strongly advised all growers to take every possible precaution and endeavour to eliminate disease from their crops. He also mentioned that the laboratory at Fredericton had been established for the purpose of assisting farmers in the work of disease control and any help asked for along this line would be willingly given.

The next address was on "The Preparation of Land and Cultural Methods for Potatoes" by Mr. W. W. Hubbard, Superintendent, Dominion Experimental Station, Fredericton. The speaker widey discussed the subject and many valuable hints and suggestions of a practical nature were brought before his audience.

Mr. J. B. Daggett next addressed the meeting. He welcomed the Convention to the Agricultural School and assured the audience that the Department of Agriculture would be only too pleased to place the building at the disposal of the Association at any time, for its meetings and exhibitions. He also gave an account of the work the Department is doing in the use of lime as a soil corrector, and he invited correspondence from those who might be anxious to obtain some advice on the treatment of sour land.

There was an audience of 117 at this session, which closed at 12.30 p. m.

The final session opened at 2.00 p. m., the President in the chair.

The first item was an address by Mr. A. P. Clark, Manager of the Colonial Fertilizer Co., Windsor, N. S., on "Potato Fertilizers and the Potash Supply". This address dealt in a very complete way with the source of the different chemicals used in the preparation of commercial fertilizers.

Mr. W. W. Hubbard then gave an address on "Results of some Experimental Work with Potato Fertilizers". This address dealt in a very comprehensive manner with experiments which were conducted at the Experimental Station, Fredericton.

Mr. S. J. Moore, Representative of the Dominion Seed Branch of Truro, N. S., next gave an address on "The Value of Shows and how to Select your Entry". Mr. Moore has had many years experience in the judging of crops and he gave his hearers much expert information as to the class of stock to select when making up an exhibit of potatoes.

At the close of Mr. Moore's address, the report of the nominating committee was handed in. This contained the names of the following as officers for the ensuing year:—

President—Mr. T. W. Caldwell, Florenceville, N. B.; Vice-President—Mr. Thomas A. Strong, Lindsay, N. B.; Secretary—Mr. G. C. Cunningham, Fredericton, N. B.; Assistant Secretary—Mr. Geo. Partridge, Fredericton, N. B.; Treasurer—Mr. W. H. Moore, Scotch Lake, N. B.; Auditor—Mr. W. Jarvis, Woodstock, N. B.

Advisory Board—Mr. Donald Innes, Tobique River, N. B.; Mr. W. E. Palmer, Scotch Lake, N. B.; Mr. James Bremner, Jr., Chatham, N. B.; Mr. A. A. H. Margison, East Centreville, N. B.; Mr. T. A. Goggin, Elgin, N. B.

Butter and Butter Scoring at N.S. Dairymens Convention

At the Dairymen's Convention held in Truro, N. S., last week, there was a very creditable display of October butter in 56 lb. boxes, and new made butter in 28 lb. boxes, and in prints.

The butter was scored by a scale of points as follows:—Flavor, 45; body, grain and texture, 25; color, 15; salting, 10; finish, 5; total, 100.

The judging was done by Messrs. Harvey Mitchell, C. W. McDougall and Joseph Burgess, working independently and the decision was made on the average score of the three. In cases where two or more scores chanced to be the same, the award was given to the highest in flavor.

The official scoring will be found in this issue.

Forty dollars in each of the three sections were divided pro rate to all butter scoring over 92 points. In section one four exhibitors received a slice of the forty. In sections two and three all the exhibitors came in for a share.

The Canadian Salt Co., Windsor, Ontario, who are consistent advertisers in the columns of the Maritime Farmer, donated four cash prizes totalling $34.00 to the butter scoring highest in sections 1, 2 or 3, salted with Windsor Salt. Their representatives, Mr. Jas. McManus of Windsor, Ont., and R. W. Tilton, St. John, N. B., attended all the sessions of the Association and made many friends among the buttermakers as the salt they represent has long since made and retained among the users of Windsor salt in the dairies of the Maritime Provinces.

The LaHave Creamery Co's butter in the 28 lb. box, new made butter, scored the highest at the show, viz:—96.4 points and was awarded the first Windsor salt special prize as well as the Butter Buyer's Trophy, donated by Smith & Proctor of Halifax and Sydney; R. B. Colwell and Nickerson & Co., Halifax and the Harris Abattoir Co., Ltd., Sydney. This trophy was captured in 1916 by The Brookfield Creamery Co. It must be won three times before it becomes the absolute property of the winner.

The DeLaval Dairy Supply Co. Ltd., put up a silver trophy for the buttermaker securing the highest aggregate score in sections one, two and three, who is a user of one of the major pieces of DeLaval machinery.

C. Richardson & Co., St. Mary's, Ontario, offered two prizes, $15.00 and $10.00 to the butter scoring highest in Section 1, using a Success churn or vat. The first prize went to Scotsburn Creamery and the second to LaHave Creamery Co.

The J. B. Ford Co., Wyandott, Michigan, donated a size 12 Elgin movement watch, with a 20 year gold filled, plain thin model, open faced case, to the buttermaker having the highest average score in Sections, 1, 2 and 3 who is a user of Wyandotte dairymen's cleaner and cleanser. The watch was captured by Alvin Graham, of Scotsburn Creamery.

Then there was a butter scoring competition conducted as follows:—Three or more samples of butter were selected and scored by the official judges in points and one-tenth points and their average score in each division of each sample was the official score. The competitors scored separately. The official score was represented by 100 marks. Deductions of one-tenth mark were made for every one-tenth point over or under the official score in each division, such as flavor, grain, color, salt and finish. The total deduction of the three lots were deducted from the possible mark of 100 and five prizes aggregating $30.00 awarded in order of merit, as will be seen in the table headed Butter Scoring Contest.

Mr. Proctor of the Smith & Proctor Co., Halifax, was present at the sessions and rendered valuable assistance in the discussions when requested to give his opinion of any particular sample re quality or finish from the butter buyers' standpoint.

Mr. C. W. McDougall conducted the discussion on the merits and demerits of the various samples and instructed how to avoid undesirable traits in butter.

Messrs. Mitchell and Burgess also participated in the discussion. Their practical suggestions were of much value to the buttermakers.

W. A. MacKay, Dairy Superintendent for Nova Scotia is working with and for the dairymen of Nova Scotia for the up lift of the industry. He works for their best interests and one does not have to linger long among the dairymen and buttermakers when assembled to find out that they are with him and ready to stand by anything he undertakes for the benefit of the industry to a man.

SECTION 1—56 lb. Box October Butter

Name and Address	Entry No.	Flavor	Grain	Color	Salt	Finish	Total
Scotsburn Creamery, Scotsburn	29	40.3	24.1	14.6	10	4.8	93.8

Quality and uniformity in live stock are what command the top prices on the market. A pure-bred bull of an approved type imparts these characteristics to his offspring.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

LIVE STOCK RAISING ESTABLISHES AGRICULTURAL CREDIT OF BEST KIND

"One of the difficulties confronting the American farmer is the want of agricultural credit. By this is meant short time credit, similar in degree to the credit of commerce, as distinguished from long time credit or mortgage loans. While the latter form of credit has had an extensive development in this country, agricultural credit as such is virtually non existent, and the farmer has been forced to depend for his annual working capital upon the generosity of neighbors, the forbearance of the local storekeeper, or the cupidity of the usurer."

The foregoing paragraph is from a recent issue of one of the publications of the International Institute of Agriculture.

Yes, there is a need for a system of agricultural credit, but our observations in districts where there used to be mortgages at high rates of interest on the majority of the farms, and where long term credits were in vogue at the country stores since live stock raising and dairying have been adopted and consistently adhered to, the mortgages are being or have been wiped off to a large extent, cash is paid for practically all commodities purchased and tidy sums are in the bank accounts of the respective farmers.

Live stock farming is without doubt the safest and surest form of farming. There are no very lean years owing to failure such as so often confronts the farmer who specializes on grain or fruit.

ANIMAL IMPROVEMENT

L. Ogilvie writing in a recent issue of the Breeders' Gazette says:—

"The more settled a country becomes and the longer live stock improvement has continued the harder it is to realize high prices for any but the best male animals and the more the knife must be used. Male animals of fair quality become super-abundant. The higher prices of meat make this less important. A high quality in females leaves the breeder who would be successful no choice. He must have constantly better males or retrograde. A great deal of waste is saved because males that have proved themselves are not allowed to go to the butcher, but are carefully passed on from one herd to another so long as they are useful. Any association that helps to keep first-class males from the shambles is doing useful and constructive work. Immense areas can be populated with first-class stock by such means, while the process is so slow as hardly to be discernible where the stay of sires is but a year or two."

REVIEW YOUR EXPERIENCES

We have reached the close of the year 1916. This issue of the Maritime bears the insignia 1917. The first few days of the year is a good time for taking stock of what transpired during the past year. As you meditate on these things give some thoughts to the experiences you have had during the past season and endeavour to determine just where your weaknesses have been. Compare your practices with those followed by farmers of wider experiences and note how they agree. It is the part of wise men to adopt new methods whenever they are shown to be superior to the old. Remember it is never too late to begin good farming practices, although it may prove rather costly if delayed too long. The moral is, don't delay.

IT PAYS TO ADVERTISE

On the poultry page of this issue of the Maritime Farmer will be found an address delivered at the recent annual meeting of the Maritime Poultry Association by its president, Mr. A. F. Huston of Charlottetown. For an incentive to more active work in the production and marketing of poultry products read this address. And breeders of pure bred poultry, pay ye particular attention to the last paragraph. There is a hint in it as to how you may increase your business. A word to the wise is sufficient. Advertise in the columns of the Maritime Farmer.

* * *

Teach your sons and daughters how to live, and then let them decide who to live with.

* * *

Dry sleeping quarters are essential to the health of either pigs or sheep in winter.

* * *

Find out if you can, what the experimental farm in your province has been discovering this year that would be useful to you.

* * *

Co-operation of town with country is all right in its place, but look out for the middleman whose chief object is to get the farmer to increase his product so as to decrease the price he gets for it. That means more work for less pay, whereas what we farmers are after is more money for what we do raise.

The problem of good seed will be more acute next spring than ever. If you have not saved your own good seed we would advise you to buy early.

* * *

Farming has many discouraging features, but so has every other business. Experience will prove that farming has no more disappointments than the others.

* * *

It is said $100,000,000 worth of grains are annually used in distilleries of United States, and that if the grain thus used were turned into the food market, a shortage would not exist such as is putting prices so high now.

* * *

A good road between every farm and market is a reasonable and worth while proposition. As a fence is no stronger than its weakest spot, a road is no better than its worst part.

* * *

A contemporary says: "Do not complain of a publication that brings you plenty of inquiries (in advertising) but few sales. The fault will probably lie more with you and your handling of the inquiries than it does with the publication."

* * *

It takes a good farmer to keep up a farm after it has been put in order; it needs a better farmer though to improve it after it is run-down and make a living at the same time.

* * *

No one should expect to derive either pleasure or profit from a scrub herd kept in a poorly lighted, unclean, and fly-infested stable, or from a herd which obtains its chief sustenance from a nearby stack of straw.

* * *

The boy who is properly guided in his work with live stock will always see more in cows than the drudgery of milking, more in swine than the grunt and squeal, more in the horse than the patient servant, and more in the sheep than the golden hoof.

* * *

A real source of profit is to be found in bringing a farm up from a badly run down condition to a state of new fertility, good repair and modern equipment. To do this requires the work and brain of a real farmer.

* * *

Did you ever think of the relation of the farmer's bank account to the tool shed? Machinery depreciates faster in the weather than it does in use. The time saved by having a rust-free implement will soon pay for the shed.

* * *

A great deal of labor may be saved by hitching the gasoline engine to such machinery as the cutting box, pump, pulper or wood saw, not to mention the cream separator, washing machine and churn.

* * *

Are you taking the best care of your farm machinery? Is it properly housed? Have you greased or vaselined the parts that are liable to rust? Have you covered the various machines to prevent dust and dirt from working into the bearings and leaving a messy job to be cleaned up before you can again run the machine? Farm machinery is no more fool-proof than is the machinery used in other industries. The following reply to the question what is a gas engine in a recent number of The Farm Implement Trade contains a hint that is applicable to the care of all kinds of farm machinery. Read it.

What is a gas engine?

A gas engine is: A help or a hindrance. A money-saving machine or an expense account. A safe source of power or a dangerous contraption of the devil. A toy or a tool.

In other words a gas engine is just what you make it—it all depends on you.

N. B. POTATO GROWERS CONVENTION

(Continued from page 173)

It was moved by Mr. W. W. Hubbard, seconded by Mr. W. E. Palmer, and carried unanimously, that the report of the nominating committee be received and adopted.

The following resolutions were also moved, seconded and carried unanimously:—

That the acreage of potatoes entered in each instance in the field crop competition during the coming season, be two acres of Irish Cobblers and five acres of Green Mountains.

That competition be limited to members of the New Brunswick Potato Growers' Association.

That the arrangements for this competition be left in the hands of the Executive Committee.

That the Association become affiliated with the Potato Association of America.

That the Association endeavour to hold a summer meeting in conjunction with the Farmers' and Dairymen's Association, during the coming summer.

That the Secretary be instructed to write a letter of thanks to each of the commercial agencies for their donations towards the funds of the Association.

That a vote of thanks be tendered the speakers at the Convention.

That a vote of thanks be tendered the President, Secretary and Treasurer of the Association.

That the Convention do now adjourn.

There were 104 members and delegates present at this session, which closed at 6.30 p. m.

PRIZE WINNERS AT N. B. POTATO SHOW

Following is a list of prize winners at the New Brunswick Potato Growers' Association at Woodstock recently.

Class I.—Green Mountain Group.

H. Gordon, Chatham; W. E. Palmer, Scotch Lake; P. S. Bremner & Son, Chatham; W. A. Kelley, Jacksonville; N. L. Napier, Lower Woodstock; H. B. Parlee, Sussex; Allison Shaw, Hartland; Henry White, Chatham; W. H. Moore, Scotch Lake; H. W. Rogers, Woodstock; W. A. Gibson, Jacksonville; E. Lorne Hume, Florenceville.

Class II.—Irish Cobbler Group.

H. Gordon, Chatham; F. E. Henderson, Andover; Allison Shaw, Hartland; H. B. Parlee, Sussex; W. E. Palmer, Scotch Lake; G. L. Mallory, Upper Woodstock; W. A. Gibson, Jacksonville; C. H. Gray, Jacksonville; Henry White, Chatham; Bert L. Shaw, Upper Woodstock; J. C. Hunter, Florenceville; T. H. Manzer, Aroostock Junction.

Class III.—Any Long White Variety.

H. Gordon, Chatham; W. E. Palmer, Scotch Lake; Allison Shaw, Hartland; G. F. Neales, Summerville; A. A. H. Margeson, East Centreville; Edwin Estey, Woodstock.

Class IV.—Any Rose Variety.

W. E. Palmer, Scotch Lake; Allison Shaw, Hartland; G. G. Porter, Andover; James E. Porter, Andover; Mrs. E. W. Darcus, Fredericton.

Class V.—Any Red Variety.

H. B. Parlee, Sussex; Donald Innes, Tobique River; David Currie, Tobique River; W. H. Moore, Scotch Lake.

Class VII.—Best Collection of Any Four or More Varieties.

H. Gordon, Chatham; H. B. Parlee, Sussex; W. E. Palmer, Scotch Lake; W. H. Moore, Scotch Lake; Donald Innes, Tobique River; David Currie, Tobique River; J. W. Stevenson, Tobique River; A. A. H. Margeson, East Centreville.

Class VIII.—Best Advertising Seed Display.

W. E. Palmer, Scotch Lake; W. H. Moore, Scotch Lake; H. B. Parlee, Sussex.

MORE ABOUT OLEO AND BUTTERINE

Anet the article on the prohibition of Oleomargarine products in Canada by Mr. W. A. MacKay, Superintendent of Dairying for Nova Scotia, which appears on another page of this Maritime Farmer, we reproduce the following from the columns of The Breeders' Gazette. It explains some of the things we may look for if Oleo gains a footing in Canada and thus supports Mr. McKay's arguments:—

A Restaurant Man's Plea for Fair Play

"A Chicago man who operates nearly 100 pure food restaurants over the country took space in city papers recently to offer $1,000 reward to any one who could prove that oleo or imitation butter was served in his restaurants, used in his kitchens or bakeshops or kept in his commissaries for any purpose. He declared that he could save $100,000 a year by serving butterine instead of butter, and also stated that many a restaurant and high-priced cafe and hotel was effecting that saving by the use of imitation butter unknown to its patrons. This man asserted that any one has a perfect right to use butterine on his own table, but added vigorously that "no restaurant, cafe, or hotel proprietor has any business serving you butterine when you think you are getting butter. If they want to make extra profits that way, they ought to put up a sign and let you know."

"This has the right ring. The producer of butter and the purchaser of butter have no quarrel with the imitation product so long as it is not palmed off as the higher-priced article. When the cow-man feels the competition of a lower cost product, and when the householder pays the price of butter and gets an imitation that the retailer has bought at a less price, each has a perfectly well-grounded grievance. Of course in the utterance of wholesome truth this purveyor of pure food to the public aimed his broadside at competitors who make by deception the profits which he scorns to reap. It was one way to uncover a petty fraud, but he had a more effective weapon at hand. In the majority of states which exercise supervision over foods, all places that sell butterine, and all eating houses which serve it are required to placard that fact plainly. The Federal statute goes so far as to put a tax of 10 cents a pound on butterine when colored to imitate the real article, seeking in this way to prevent deception. The law could readily enough be invoked to suppress unfair competition. The enforcement of the Federal statute has been particularly strict of late."

A Comment by the Butterine Maker

"A capital illustration of the art of modern advertising was furnished when a prominent Chicago manufacturer of oleomargarine promptly seized the proclamation of the restaurant man as a text, and declared that his "position that butterine should be sold on its own merits is absolutely correct." And then deftly turning the economy argument to trade advantage this maker of the imitation product asserts that "every housewife in Chicago could save a proportionate amount by using oleomargarine," as it is a "clean, pure, wholesome food product made under the United States Government supervision, and the use of this product in the home is a compiment to thrift and judgment."

"It was neatly turned. It is certainly encouraging to have makers of the imitation goods assert publicly that butterine should be sold on its own merits. They have not always held that view. The ten-cent tax is evidence on that point. Of late years, however, most of the best-known makers of butterine have pushed it openly through advertisement, and labeled it properly and conspicuously. If that course had been pursued in the beginning, it is likely that the ten-cent tax would never have been levied. Evasion of the law against selling the imitation article colored to resemble butter and at the price of butter has been of rather recent court record. The dairy farmer and the butter manufacturer desire protection against this easily accomplished fraud and the consumer is entitled to it. If all makers were as aboveboard as the manufacturer quoted, and if dealers would not endeavor to palm off the colored imitation at the prices of the real, the matter of tax could be quickly removed from the field of controversy. The position of the butter industry is that sufficient tax should be levied to insure the enforcement of the law which seeks to bring butterine to the consumer under its own name and at prices relative to its lower cost of production."

THE MARITIME STOCK BREEDERS' ASSOCIATION

The annual meeting of the Maritime Stock Breeders' Association was held in the N. S. A. C., Truro, on January 4th at 4 p. m. A. E. Trites, president of the Association occupied the chair. There was a good representation of the stock breeders of the three provinces in attendance.

After a short address by the president, Mr. Fuller, the secretary, read the minutes of the last annual meeting and special meetings since held. He also gave a verbel report of the various transactions carried on by the Association during the year.

Greetings from the Nova Scotia Dairymen's Association then in session at Truro were also read.

A letter from the Maritime Poultry Association announced that J. P. Landry had been appointed a director by that Association to represent them at the Stock Breeders' Association board.

Mr. Fuller announced that owing to the Winter Fair Buildings, Amherst, being in the hands of the military authorities, the executive of the Association found that they could not hold the 1916 Horse Show and Winter Fair. They had however, decided to hold a Maritime Poultry Show, and as the town council of Amherst would not undertake to furnish quarters other than the Fair Building, the Moncton City Council was approached. The city of Moncton furnished heated and lighted quarters and consequently the fair was there held. The attendance at the Show was not very large, but otherwise the Show was a decided success. The Dominion Government gave $500.00. The governments of Nova Scotia, New Brunswick and Prince Edward Island $300.00, $200.00 and $87.50 respectively, as grants for the Show.

The question of cheaper rates for the transportation of pure bred stock on railroad lines, which was discussed at last years meeting had brought forth fruit and before shipping any pure bred stock farmers and breeders are requested to acquaint themselves with the new Tariff Rates on Live Stock No. 6L—30.

The financial statement showed a balance on January 1st of $1309.88. on the right side of the ledger.

A resolution asking that the Association make representations to the Fredericton Exhibition Commissioner re civil treatment for the exhibitors and that they be allowed to load their live stock during daylight hours of the last day of the Fredericton fair, was introduced and adopted.

The fair Boards of Halifax, Fredericton, St. John, Charlottetown and Chatham will be asked to pay second and third prizes, in cases where no competition exists, providing creditable entries are made.

The holding of a Winter Fair in 1917 was left in the hands of the incoming executive with the recommendation that they do their utmost to hold a fair during the second week of next December.

Committees were appointed to work with The Nova Scotia Farmer's Association and The New Brunswick Farmer's and Dairymen's Association re the framing of recommendations to the government of the respective provinces for the enactment of more adequate protection to sheep breeders from the ravages of dogs.

Messrs. John O'Brien, S. A. Logan and W. W. Black constitute the committee to confer with the Nova Scotia Farmers' Association and W. S. Harding, W. W. Hubbard and A. E. Trites will meet the New Brunswick Farmers' & Dairymen's Association.

The election of officers resulted as follows:

President—A. E. Trites, Salisbury, N. B.; Vice-President for N. B.—W. W. Hubbard, Fredericton; Vice-President for N. S.—S. A. Logan, Amherst; Vice-President for P. E. I.—Hon. Murdo McKinnon, Charlottetown. Directors for N. B.—R. L. Hicks, Dalhousie Jct.; A. McQ. Avard, Sackville; W. S. Harding, Hammond River; W. W. Hubbard, Fredericton.

Directors for Prince Edward Island—J. M. Laird, Kelvin Grove; J. F. Roper, Charlottetown; W. M. Lea, Victoria; Hon. Murdo McKinnon, Charlottetown.

Directors for Nova Scotia—S. A. Logan, Amherst; John O'Brien, Windsor; Laurie McFarlane, Fox Harbor Pt.; W. W. Black, Amherst.

Sec.-Treas.—F. L. Fuller, Truro.

SHORT COURSES AT THE N. S. A. C.

This is the day of efficiency. The best butter, poultry, fruit, eggs, vegetables, live stock and farm crops are what bring the top prices, the most profit for time and labor expended, and guarantee the future market. It takes thought and care to provide these, but from all standpoints it pays.

How to accomplish these results and be prepared for now and after the war is the keynote of the short courses now being held at the N. S. A. C., Truro. We had the pleasure of visiting the college a few days last week and sit in class with the young men who are attending the courses from Nova Scotia, New Brunswick and Prince Edward Island.

The attendance is well up to the capacity of the college and it certainly was a source of inspiration to listen to the efficiency talks by the various professors in their respective lines. The discussions and demonstrations are most helpful and the interest evidenced in this progressive work augur well for preparedness.

In the live stock pavillion talks on live stock judging with ample material for demonstration from the college herd and the herds of the prominent breeders near the college were eagerly followed and intelligently participated in by the student farmers.

Prof. Zavitz of the O. A. C., Guelph was in charge of seed judging classes.

The Ladies Short Courses are also well attended and particular emphasis is aid on economy in the guidance of home affairs by the instructors.

There is no waning of interest in regard to the N. S. A. C.

GROUND LIME STONE

On another page of this issue will be found the Pulverized Limestone advertisement of C. H. Peters' Sons, of St. John, N. B. The results of experiments conducted in the Maritime Provinces and elsewhere, with pulverized limestone is well known to readers of the Maritime Farmer. Pulverized limestone is the cheapest and safest agent to use in the sweetening of sour soils. Write to C. H. Peters' Sons for their prices and any information you may require.

HORTICULTURE

ORCHARD TROUBLES

Dropping of Apple Leaves.—Many leaves drop from apple trees in summer and cause anxiety to fruit growers. Probably the three most important reasons why the leaves drop are: First, that the tree may regain a proper balance between top and root. There is often a great leaf developmnt, owing to moist conditicns, and when drier weather comes, there are too many leaves for the tree to support, hence some of them drop off. Second, that under certain conditions, especially when there has been a wet season, leaves will scald and drop off. Spraying sometimes causes this scalding. Third, that the leaves are affected with a leaf spot disease. The development of this disease may, however, come after they become weak from lack of moisture to support them, or when the leaf is weakened by sunscald. As a rule, under good cultivation, there are quite sufficient leaves left to develop the fruit properly.

Spray Injury—Russeting of Apples.—For the past few years complaints have been made that spraying trees with Bordeaux mixture injured the apples, causing them to become russeted, the Ben Davis suffering in particular. There is no doubt that when Bordeaux mixture is not made with sufficient lime, injury will occur, but injury has followed the use of properly made Bordeaux, and it has been found that the climatic conditions which have prevailed, either before or when the spray was applied, have much to do with it. The worst injury has occurred in the districts bordering the Great Lakes and in the Maritime Provinces, where the air must be considerably moister than further inland, and in a damp season the air is still moister, hence the skin of the apples is more tender than it is where the atmosphere is drier, and when a spray or even heavy dew rests on the fruit during bright sunshine and hot weather, scalding and russeting follow. This may be due in part to the fungicide in the mixture. Russeting occurs even when trees are not sprayed, due, it is believed, to scalding caused by a heavy dew in bright, hot weather. It would be a good practice, where it is possible to carry it out to spray the south side of the trees in the morning and the north side in the afternoon, so that the mixture would have a chance to dry on the tree before the sun shone on it.

Water Core

In some seasons, and in certain parts of Canada more than others, a few varieties of apples become more or less water cored and are rendered less valuable on this account. This condition is now considered to be brought about by sap pressure caused by cool nights following very warm days. The transpiration of water from the leaves is more rapidly checked, than the upward flow, by a considerable lowering of the air temperature with the result that the flesh of the apple is flooded with sap.

Trees growing rapidly in moist soil are liable to be more affected than others making slower growth and trees which have lost part of their foliage through any cause are also more subject to it than trees with good foliage. Water coring is difficult to guard against as it is due to climatic conditions. There is likely to be considerable loss from water cored fruit if packed for export.—W. T. Macoun.

PROTECTION OF APPLE TREES FROM MICE AND RABBITS, AND CARE OF INJURED TREES

Every year thousands of trees are injured in Canada by mice, and, in the newer districts, a large number of rabbits also. There could be nothing more discouraging to a fruit grower, than to see his orchard which he had cared for, perhaps, for five or six years, ruined by mice; and yet this frequently happens. All this could be prevented if the farmer or fruit grower would use the information available and protect his trees from mice. Some years there is less injury than others, and this fact leads to carelessness, and when a bad year comes the trees are unprotected.

While the depredations from mice and rabbits in winter vary from one year to another, depending on the scarcity or abundance of food, the number of mice which are in the vicinity and the character of the winter, the injury is always greatest when the orchard is in sod, and when there is rubbish lying about; hence the latter should be removed before the winter sets in. In most cases it is not necessary nor advisable to have the orchard in sod, particularly when the trees are young, although it is highly important to have a cover crop, which also may sometimes become a harbour for mice. As mice may be expected in greater or less numbers every winter, young trees should be regularly protected against their ravages. Mice usually begin working on the ground under the snow, and when they come to a tree they will begin to gnaw it if it is not protected. A small mound of soil from eight to twelve inches in height raised about the base of the tree will often prevent their injuring the tree, and even snow tramped about the trees has been quite effectual, but the cheapest and surest practice is to wrap the tree with ordinary building paper, the price of which is merely nominal. Tar paper is also effectual, but trees have been injured by using it, and it is well to guard against this when building paper will do as well. After the paper is wrapped around the tree and tied, a little earth should be put about the lower end to prevent the mice from beginning to work there, as if they get a start the paper will not stand in their way. It may be stated, however, that although two thousand young trees have been wrapped with building paper for several years at the Experimental Farm at Ottawa, there have been practically no instances where the mice have gnawed through the paper to get at the tree. The use of a wire protector, or one made of tin or galvanized iron, is economical in the end, as they are durable.

In the north, protection from sunscald is almost as important as protection from mice. At the Central Experimental Farm, wooden veneer

Kirstin Horse Power Puller
The Kirstin is the best on the market. I pulled 2000 stumps, some running as high as 50 inches in diameter and we averaged about ten minutes per stump.
ALEX. ZACHARIA,
Sandy Lake, Man.
80 stumps in 100 minutes. Record made by Kirstin Horse Power Puller under official test at the Land Clearing Demonstration of the University of Wisconsin.

Yank Out Those Stumps!

A Guaranteed Saving of from 10% to 50% in Clearing Land Ready for the Plow.

The rich crop pictured above, is growing on what was a tax-eating stump field. The owner got it ready for the plow the Quickest, Cheapest and Best Way—with the Kirstin Method.

Thousands of Canadian farmers have increased the productive value of their land a hundred-fold by clearing the Kirstin way. You do the same. Stop paying taxes on worthless stump fields; make them earn money for you—get a

Guaranteed for 15 Years

Kirstin Stump Puller

One Man — Horse Power

A Money Back Bond

No deeply imbedded tap-root is too big for the Kirstin Horse Power Puller. Its mighty strength is irresistible because of its triple power and other exclusive Kirstin features. It will clear more than two acres at one setting without strain to man, horse or machine. For 21 years it has proved its invincibility on Southern stump fields.

One man without horses can pull the biggest stumps, too, with the Kirstin One Man Stump Puller. A little push on the handle gives tons of pull on the stump. This enormous power is developed by use of double leverage. It gives an ordinary 17-year-old farm boy a giant's power.

There is a machine for every need, from the smallest land clearing job to the biggest. Every customer is given a Guarantee Bond that The Kirstin Method will clear your land and make it ready for the plow at a cost from 10% to 50% cheaper than any other. Every Kirstin Puller is guaranteed against breakage for 15 years. Every puller is sent on 10 days' trial and money refunded if our guarantee does not deliver the goods.

Make $20 Profit Out of Every Acre of Maple Trees

If you have a grove of maple trees we will gladly show you how to make an average of $20 profit out of every acre that contains 100 or more average size maple trees. Some farmers make $40 to $50 per 100 trees.

You will be surprised to know that, acre for acre, maple trees will produce a bigger profit than any other crop that you raise and there is no seed to buy, no ploughing or cultivating and very little labor—all you have to do is to harvest, which requires only about two weeks at a time when you can not do any other kind of work.

We not only show you how to make the most dollars out of your maple grove but will supply you with economical equipment and allow you to pay for it in three years if you want to.

Ask us to tell you about maple sugar making—the most profitable of all crops.

Fredericton, N. B.

protectors have been used for several years past for the standard trees, as these protect from mice and on account of being loose about the tree leave a good air space which appears to protect the tree from those sudden changes of temperature which seem to be the main cause of sunscald.

There are a number of washes and poisons recommended for the protection of fruit trees and the destruction of the mice and rabbits, but none of these are very satisfactory, as if the mice or rabbits are numerous the poison has not sufficient effect upon them to prevent injury altogether. The following method of poisoning has been found fairly successful.

Make a mixture of one part by weight of arsenic with three parts of corn meal. Nail two pieces of board each six feet long and six inches wide together so as to make a trough. Invert this near the trees to be protected and place about a tablespoonful of the poison on a shingle and put it near the middle of the run, renewing the poison as often as is necessary.

The following formula, as a protection from rabbits, is recommended by the Department of Agriculture, Washington, D.C.: Unslaked lime, 20 pounds; flowers of sulphur, 15 pounds; water, 50 gallons (40 Imperial gallons). This is applied to the trunks of the trees with a brush.

Treatment of Injured Trees.

If a tree is badly girdled by mice it usually dies. If as soon as the wound is noticed it is cleaned and covered with grafting wax or some paste, such as sulphur, cowdung and clay, and drapped with cloth to exclude air and prevent the wound from drying out, there is a possibility of saving the tree if the girdle is a small one, as the sap which rises through the wood will continue to do so, and returning through the inner bark in an elaborated condition will cause growth to be made all around the upper part of the wound, and if the latter be not too large there is a chance of its healing over. If, however, the wood becomes dry before the bandage is put on, the tree will almost certainly die, although it may continue to grow throughout the season. When the wax and bandage are applied the tree should be headed back considerably to lessen the amount of transpiration of moisture, as there will not be as much sap rise as if the tree were uninjured, and the wood will thus dry out sooner than if it were headed back. If the girdle is near the ground, in addition to covering the injured part with wax or cowdung and clay, it is advisable to mound up the soil about the tree to cover the wound and thus help to prevent the wood from drying out.

Girdled trees are frequently saved, and more surely saved than by the above method, by conncting the upper and lower edges of the girdle with scions, which are inserted about an inch apart all around the trunk. This is known as bridge grafting. The more scions that are used the quicker they will grow together and form a new trunk, but two or three scions successfully grafted on a small tree will carry enough sap to keep the tree alive. A slanting cut is made at each end of the wound in the uninjured wood in which the ends of the scions are to be inserted. Strong, plump scions of the previous season's growth—not necessarily from the same tree, nor even the same variety—cut a little longer than the distance between the slanting cuts, are made wedge-shaped at each end. They are made a little longer than the distance between the cuts in order that when inserting the ends into the cuts it will be necessary to bend them, and thus have them under pressure, which helps to keep them in position. After inserting, some of the inside bark of the stock should remain in contact with the inside bark of the scion as it is here or at the cambium layer where union takes places. As soon as the scions are all placed the wound, especially about the ends of the scions where inserted in the stock, is covered with grafting wax. The ends are also at the same time bandaged with a piece of sacking around the trunk to aid in keeping the scions in place and to exclude the air. The tree should then be well headed back. The scions, if properly made and inserted, should soon unite with the stock and then carry the sap to the top of the tree.

Another method of bridging is to cut back the uninjured bark evenly all around the trunk and insert the wedge-shaped scions underneath the bark at the upper and lower ends of the wound. There are other methods also employed, such as using a scion beveled at each end. Also, boring holes with an auger at each end in the uninjured back and shaping the scion at each end so that it will fit into it.

One of the most satisfactory methods of utilizing the girdled tree is to cut it off close to the ground and insert a scion of some variety. This graft should grow at least three feet in height the first season and make a nice young tree.

A tree may sometimes be saved when the girdling is well above the graft by cutting the tree back so as to remove all of the injured part. Under such conditions young trees will usually start fresh growth and the strongest shoot may be selected to form a new trunk and top for the tree.

THE MOST MODERN WEAPON
FOR PROTECTING YOUR FIELD AND ORCHARD CROPS

from being destroyed (or their market value lessened) is the SPRAMOTOR. It will enable you to combat the potato beetle and blight quickly and effectively. In the orchard—to produce 75% No. 1 fruit and have cleaner, healthier trees—free from scale and bark louse.

OLEOMARGANINE IN CANADA

Editor The Maritime Farmer

A movement which is receiving a good deal of support in Canada today is that which aims to get the ernment to remove the restrictions which at present exist in regard to the importing, manufacturing and selling of oleomargarine in Canada. The movement has been prompted largely by the present high price of butter. Those who are behind the movement claim that, if it is consummated, it will result in giving the consumer cheaper butter. From this it might appear that the consumer was the real agitator behind the movement but such is not altogether the case as will be shown in the latter part of this article.

Naturally, dairymen all over Canada are opposed to this movement which they believe will militate against the splendid development which has taken place in dairying all over Canada and in no part more than in the Maritime Provinces. It is our intention, however, not to deal with the matter from the dairymen's standpoint but from the standpoint of the consumer.

First, oleomargarine, butterine and other so-called imitations of butter are made from a combination of different fats, such as lard, tallow, the leaf fats in the intestines of animals, etc. compounded with vegetable fats, which rendered and sterilized together result in a product somewhat similar in texture and flavor to butter itself. But this mixture, like all imitations, does not come up to the original article. It lacks the fascinating characteristics, the appetizing flavor and the aroma which are peculiar to good butter alone.

In the United States, where oleomargarine is manufactured and sold to a large extent, it was found that the sale was reducing the sale and consumption of butter. This however, was due not so much to the fact that so much oleo took the place of so much butter but rather to the fact that consumers of butter, knowing that there were imitations on the market, lost pleasure in eating what was set before them for butter and often did without fearing lest the seeming genuine article were an imitation. For this and other reasons, legislation was enacted prohibiting the manufacture and sale except under certain restrictions, the manufacturer and seller having to pay license fees and comply with very stringent regulations. To carry out the provisions of this legislation, an army of inspectors was employed but despite all the restrictions and the methods taken to enforce them, it is stated that the law is being constantly broken.

Nor has this manufacturing and selling of oleomargarine in the United States given the consumer any substantial relief. For the imitation article is held as close to the price of the genuine butter as it can be sold. However, since the imitation is manufactured from cheap fats, both the manufacturer and the seller realize handsome profits.

From the foregoing consideration, it should not be hard for the people of Canada to get at the real source of the agitation for the removal of these restrictions in regard to oleomargarine

Coming apparently from the consumer, there is little doubt that the agitation con be traced to the manufacturer who has the biggest interest at stake in the matter.

To sum up the situation:

No permanent relief from the high price of butter would be obtained for oleomargarine would be held at as high a price as possible. The fact that when eating so called butter a person would always be suspicious that it was the imitation and not the genuine article, would take away the zest from eating one of the most healthful and wholesome articles of diet. It may be claimed that legal restrictions would prevent this result, but such has not proven the case in the United States.

To enforce the restrictions an additional tax would have to be levied on the people to pay for the necessary inspection.

For all these reasons, we appeal to the consumer just as strongly as to the dairyman to use his influence to prevent the authorities at Ottawa from changing the present law. And we urge both consumer and dairyman to move quickly in letting their objections be known. This can be readily done through such channels as the Trade Unions, County Farmers' Associations, Women's Institutes, Local Council of Women and many other organizations whose interests are identified in matters of this kind.

The whole question is worth the careful consideration of every consumer as well as every dairyman in Canada.

W. A. McKay, Dairy Superintendent,
W Province of Nova Scotia.

MAKING BEST FARM BUTTER

No one has mastered the art of dairying until he is able to ripen cream thoroughly. The losses from poorly ripened cream may run all the way from 25% to 33 1-3%—too much for profit.

To ripen cream cool it down thoroughly; stir to the bottom every little while; if two messes are combined, mix till there is no difference from top to bottom. Churn at 50 to 55 degrees in summer, 10 degrees higher in winter.

The man who runs a separator on a floor that is not level invites early wearing out of a costly machine.

A dairy thermometer costs a quarter and it may save a dollar's worth of butter every churning.

An aerator is a fine thing. Save on something else and get one. It will shorten labor.

It is hard to beat the good old barrel churn. I never felt like exchanging ours for any of the modern substitutes.

Good salt adds much to the taste of butter and increases its keeping qualities.

Some cows make firmer butter than others. The home dairyman never ought to keep a cow whose milk cannot be made into good hard butter. The world demands butter that will "stand up."

A good fine strainer to catch the particles of butter that come through with the buttermilk will save many a dollar.

Share the skim milk with the hens. They make as good use of it as any creature on the farm. Don't scrimp the calf or the pigs, however.

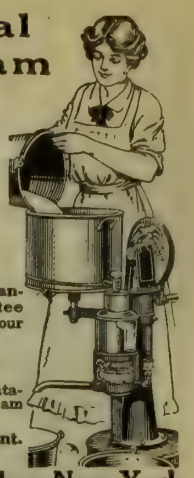
No matter how clean the jar in which you delivered butter may look when you get it back, wash and scald it thoroughly. Then you will know how the job was done.(E. L. Vinvent, Broome Co., N. Y.

FEEDING COWS FOR MAINTENANCE AND MILK YIELD

Some years ago the Missouri Experiment Station conducted a test with a dairy cow to determine if possible what bearing the inherent milk-producing characteristics had on her ability to produce milk, even provided she was given no feed with which to make it.

The cow was on test for thirty days after freshening, and was fed only enough to satisfy maintenance requirements. So strong was her inherent stimulation that instead of milking poorly she took that feed which should have gone to maintenance and used it for the production of milk. As a re-

$16.95 Upward Sent on Trial American Cream SEPARATOR



Thousands In Use giving splendid satisfaction justifies investigating our wonderful offer: a **brand new, well made,** easy running, easily cleaned, perfect skimming separator only $16.95. DR. WOOD'S NORWAY PINE SYRUP
CURED HER.

Bronchitis starts with a short, painful, dry cough, accompanied with a rapid wheezing, and a feeling of oppression or tightness through the chest. At first the expectoration is a light color but as the trouble progresses the phlegm arising from the bronchial tubes becomes of a yellowish or greenish color, and is very often of a stringy nature.

Bronchitis should never be neglected. If it is some serious lung trouble will undoubtedly follow.

Get rid of it by using Dr. Wood's Norway Pine Syrup. This well-known remedy has been on the market for the past 25 years.

It cures where others fail.

Mrs. Geo. Lotton, Uxbridge, Ont., writes: "I have had bronchitis so bad I could not lie down at night; and had to cough every few minutes to get my breath. I had a doctor out to see me, but his medicine seemed to do me no good. I sent to the druggist for some good cough mixture, and got Dr. Wood's Norway Pine Syrup. One bottle helped me wonderfully. I stopped coughing, and could lie down, and rest well at night. I cannot praise it too much."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by THE T. MILBURN CO., LIMITED, Toronto, Ont.

GOLD DUST
The Busy Cleaner

The complete confidence that millions of housewives place in Gold Dust has been won by *merit alone.* It makes dish-washing and all other cleaning and brightening *easy.*

Order it from your grocer now. Simple directions on package.

For sale in five-cent and larger packages.

Made in Canada

sult she was so emaciated and weak at the end of the period that she could hardly stand, yet she had produced in the month approximately the same amount of milk as she had in the corresponding thirty days of her previous lacation period when she had been fed enough to meet both production and maintenance requirements. Her inherent tendency to produce milk had been so strong that she had ruined her body but had not stopped giving milk.

This inherent ability to produce milk is present in every dairy cow to a certain extent, and should be given a chance to develop at a time of freshening. One of the greatest mistakes made by dairymen is in feeding cows heavily the first month after they freshen. Most men believe that such a practice is necessary in order to make a cow come to her milk; but the test at Missouri demonstrates that it is not the feed that causes the milk secretion the first thirty days; it is the birth of the calf and the consequent stimulation of the mother to furnish feed for her offspring.

A cow's ability to produce milk is limited by two factors: First, her inherent stimulus, as represented by her dairy breeding; second, her capacity to eat and digest food. A profitable producer must have both to a marked degree.

Parturition is a severe strain on a cow's system, although in most cases no particular outward sign is visible. For months the blood has been flowing to nourish the growing fetus; then the calf is born and there is a quick change of blood from the fetus to the mammary organs. If at the same time heavy feeding is started an extra supply of blood is called to the digestive tract. Such a strain will not be apparent immediately, and the cow will seem to be doing well. But bad results will show later. About the sixth or eighth week the milk yield will drop several pounds and the milker will be puzzled to explain the reason. The explanation is simple: The strain of the heavy feeding early in her lactation period has had its effect, and her system has rebelled.

On the other hand, take the cow that has been carefully handled. When she has freshened feed has been given to her as her milk has increased. There has been no forcing to make her come to her milk; her natural stimulation has been allowed to take care of that. This cow will develop her milk-producing qualities and her digestive capacity at the same time, with no undue strain on either. When she reaches her full milk flow and her full feed at the fifth, sixth or seventh week she is there to stay because her whole system has been gradually developed and strengthened, and is in sympathy with the work that it has to do.

A pair of milk scales is indispensable at this time. A record of the cow's performance for the year is a splendid thing to have, but it is as a guide to the intelligent feeding of the cow that the scales stand pre-eminent. Hang the milk scales in a convenient place in the barn and watch the milk production after the cow freshens. Let the feed follow the milk for the first six weeks, rather than make the milk follow the feed. The results will not be startling for the first week or two; the cow's production will not jump two or three pounds daily, but when she does reach her limit she will stick to it.

C. W. ADAMS.

Dryness without dust in the hogs' quarters is appreciated and paid for by all hogs can give in the way of recompense—more profit.

It is essential that the composition of the various feeds be known before attempting to compound a balanced ration for any kind of live stock.

INDISPUTABLE PROOF OF
DE LAVAL
CREAM SEPARATOR
SUPERIORITY

SINCE 1892 the National Buttermakers' Association has held butter-scoring contests each year in connection with its Annual Convention; and at every such Convention, butter made from cream separated by a De Laval Separator has scored highest. This is a 100 per cent record for the De Laval. Twenty-three wins out of twenty-three contests. No room for chance there. Only unusual merit made such a record possible.

But that is not an unusual record for the De Laval. At the great National Dairy Show at Springfield, Mass., in October, 1916, butter made from De Laval-produced cream scored highest in both the creamery and dairy classes, while De Laval cream scored highest in the cream classes.

The juries at the great national and international expositions have invariably acknowledged the superiority of the De Laval. They awarded the Grand Prize to the De Laval at the Panama-Pacific Exposition, as also at Buffalo, Chicago, St. Louis, Paris, Brussels, and all the great world expositions for 25 years.

As a matter of fact, it is very easy to prove De Laval superiority. All that is needed is a careful comparison with any other machine, either as to design and construction, or, more important still, as to performance. But such proof is no longer necessary to a well-informed dairyman or farmer. He has seen proof of De Laval superiority piled up and multiplied so many times that it is no longer open to question by anyone. It is an accepted fact.

If you are without a cream separator or need a new one, the only question you need to ask is, "Which is the proper size De Laval for me to buy?"

See your De Laval agent immediately, or, if you don't know him, address the nearest De Laval main office, as below for any desired particulars.

The De Laval Company, Ltd.

LARGEST MANUFACTURERS OF DAIRY SUPPLIES IN CANADA. Sole distributors in Canada of the famous De Laval Cream Separators and Alpha Gas Engines. Manufacturers of Ideal Green Feed Silos. Catalogues of any of our lines mailed upon request.

OUR MOTTO:
"ONLY GOOD GOODS"
And We Live Up To It Continually
QUALITY Counts, Certainly

You who are looking for a CHEAP but SERVICEABLE STOVE (whether it's a Cook-Stove or a Heater) ought to be interested in the line we manufacture in Fredericton:—

"NIAGARA" Cook Stove, 2 sizes. Wood or Coal.
"WATERLOO" Cook Stove, 2 sizes. Wood.
"FAVORITE" Cook Stove, 2 sizes. Wood.
"CARLETON" Hall Stove, 3 sizes. Wood.
"TIDY" and "SQUAT" Coal Heaters. ("TIDY" in 3 sizes.)
"RAMDOWN" Stove for camp use. 3 sizes.

These are PLAIN stoves, prices ranging from $10.00 to $16.00, but they will DO THE WORK satisfactorily. Ornamentation does not help a great deal in WARMING the house on a winter day.

No particular quality of WOOD required. Good bakers. Good heaters.

IN FREDERICTON we also make WOOD FURNACES, as well as Lumbering Machinery, Builders' and Contractors' Supplies, Stove Utensils, IRON FORGINGS, IRON and BRASS CASTINGS, ETC., ETC.

The Smith Foundry Company, Limited,

PIG FEEDING WITH PROFIT

Before attempting to consider methods of feeding the pig, it is well to consider briefly his early feeding habits. The pig in his native state lived mostly on marshy ground where he devoured large quantities of plant foods, such as nuts and roots; both of a concentrated character, but containing small amount of bone-building materials. He must supply himself with minerals, so he ate snails, clams, animals, and fish—all rich in the necessary bone-building materials. Since man has forced the pig under domestication to change his habits of life, particularly his food supply, it is important to consider the effect on the pig.

When we compare the domestic hog with the native wild hog of Europe we are astonished at the contrast. There is little doubt but that both selection and improved methods of feeding have played an important part in this change. By selecting the best types for breeding and by developing these through feeding, we have produced a hog that stands high as a meat-producing animal.

Too much stress cannot be laid upon the importance of mineral matter in the feed. The minerals calcium, phosphorus, sodium, potassium, and chlorine are probably the most important to consider in the ration. We supply all the necessary sodium and chlorine by feeding common salt. Generally all of the others, except calcium and phosphorus, occur in sufficient quantities in most feeds. Forbes, of the Ohio Station, says: "Our results show that, whatever the protein deficiencies of corn, its mineral deficiencies are more pronounced, since, in balance experimade manifestmade d tn ments, the deficiencies in calcium and other minerals are immediately made manifest by negative balances or deficient storage, while the protein deficiencies, whatever their nature, allow liberal nitrogen retention." Rcent investigations show that calcium or lime is deficient to a dangerous extent in most concentrates, and that the ratio of calcium to phosphorus should be close to 1 to 1 to make normal bone development. Bran has been regarded as a good feed to supply all necessary minerals. Experiments in feeding bran show diseases developing in horses when roughages were limited. The same may be said for oats. With both bran and oats the cause seems to be too much phosphoric acid in proportion to calcium. If the hog were able to consume roughages to a considerable extent, sufficient mineral could be supplied in this way. Unfortunately this is not the case, and the lime must be supplied in other ways.

As has been said before, all of the cereal grains are low in lime, and these feeds must be depended upon as a basis of all swine rations in this country. There are two possible ways by which the necessary lime may be supplied, viz., 1, by adding tankage, meat meal, or buttermilk; 2, by providing pasture for hogs, such as alfalfa, clover, rape, cowpea, soy bean, or Canadian field pea. Tankage or meat meal has given the best results as a source of protein and minerals for dry lot feeding. They are conducive to larger and stronger bone development than buttermilk. When buttermilk can be obtained at a figure of not above 20 cents per cwt. it can be regarded as a very good supplement to the gains. Pasture crops such as those mentioned above not only supply protein and minerals, but they also afford the pig a good chance for exercise—a point of considerable importance, especially with breeding animals.

Under some conditions it may be advisable to furnish protein to a grain ration by using shorts, oil meal or cottonseed meal. All these feeds are all right as far as the supply of protein is concerned, but they contain too high a proportion of phosphoric acid in proportion to lime. On rations of this kind, such minerals as bone ash, charcoal, rock salt, sulphur, and lime should be kept constantly before the hogs in separate compartments of a trough. This method of supplying minerals, while not the best, is very good on rations that are deficient. Experiments tend to show that lime, as it occurs in plants or animals is more valuable than that furnished as above stated.

The farmer should use slightly different methods for feeding the breeding herd from those used for the fattening hog. In fattening the chief object is to produce a maximum weight and finish in a short time and at a low cost. one development is not especially wanted except that sufficient bone to carry the animals to market and to support a large amount of flesh is wanted. With breeding sows and boars much trouble is often experienced unless good, strong bone is developed. In fact, people are hunting for what we call the "Big Type" breeds of hogs because they want bone development. It is common to see sows fed on corn alone break down in pastern or become paralyzed in the hind quarters due to a shortage of lime in the ration. The developing litter in the pregnant sow also draws heavily on the mother for minerals and these must come either from the feed or from the sow's skeleton. A large supply of mineral matter also develops a large frame in the sow and in the fattening pig, both of which are desirable.

One of the important questions that confronts the feeder is the supplying of the necessary minerals, especially calcium, to all his hogs in proper amounts. Since the cereals are more or less of an artificial diet for the pig, and low in lime, it is necessary to take caution to supply these either by pasture, by animal by-products, or in the inorganic form; when given in the last-mentioned manner, they should be fed separately, so that the pig may select what he needs, and not fed in the form of a mixture, as no mixture is as good as allowing the pig to select just what his appetite calls for.

PALPITATION
OF THE HEART
SHORTNESS OF BREATH
CURED BY
MILBURN'S HEART AND NERVE PILLS.

Mrs. S. Walters, Matapedia, Que., writes: "I wish to let you know how much good I have received by taking your Heart and Nerve Pills. I was suffering from palpitation of the heart and shortness of breath. The trouble with my heart was caused by stomach trouble.

I had tried all kinds of medicine, both patent and doctors', but I found none relieve me like Milburn's Heart and Nerve Pills. I believe anyone suffering like I did should use them. I only used four boxes and I now feel like a different person."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years and have a most wonderful reputation as a remedy for all heart and nerve troubles.

Price 50 cents. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont

BEEF $1.75 A POUND ON FOOT AT THE INTERNATIONAL

The Breeder's Gazette says in a recent issue:—

"An agitated press and emotional "women's clubs should fall more vig"orously than ever to beating the tom"toms. The grand champion steer at "the International, California Favorite, "sold for $1.75 a pound, and the mil"lionaire automobile makers in De"troit, to which city the bullock goes "for holiday beef, will not be able to "buy prize winning rib roasts and por"terhouse at the old-time price of 25 "cents a pound. Therefore summon "grand juries, spend thousands of "dollars in putting a horde of special "investigators in the field, and watch "two-year-old steers grow in a minute "—not!

"The price of $1.75 a pound on foot "for a steer, and $28 a hundred for the "champion car load, are merely symp"toms. Not every layman can inter"pret them aright, nor can the wild-"eyed leather-lunged bellower for boy"cotts and embargoes prescribe a sane "remedy. Those knowing to trade con"ditions understand what it all means. "And even they were scarcely prepar"ed to see the record of the first Inter"national, set at $1.50 a pound in an "enthusiasm which sought to encour"age the firm establishment of the "show, so far surpassed. It was an al"together worthy object on which this "stimulating price was lavished, the "young whiteface steer from the Gold"en Gate. Not the least of the lessons "emphasized is that prime beef can be "made from barley, oats, and bran. "More significantly this coast triumph, "winning a champion and reserve with "bullocks bred and fed in the college "herd, illustrates how faithfully these "educational institutions are striving "to lead the industry into lines of pro"fitable production."

The Grand Champion, California Favorite, was a senior calf sired by Prime Lad 11th, a Prime Lad bull, out of a Shorthorn cow got by a son of Glenbrook Sultan, combining in his veins cross-currents of champion blood of the Hereford and Shorthorn breeds. Carrying the white face and the Hereford red, deprived of his horns, this precious bullock weighed 1130 pounds at 13 months and a few days, and was bred, fitted and shown by the University of California.

The champion car load sold for $28.00 per cent, consisted of fat Angus yearlings.

The grand champion car load of lambs (grade Shropshires) bred and shown by Butterfield Live Stock Co., Weiser, Idaho, were sold at 21½ cents per pound.

The grand champion barrow was a Poland-China.

The champion beef carcass showed a dressing percentage of 63.08.

When tuberculosis in animals attacks the udder it is especially dangerous because then the germs are very liable to be found in the milk. The tubercular cow very often appears in poor condition. She will look thin and run down and have a rough coat of hair, with a hide that feels harsh and rough.

* * *

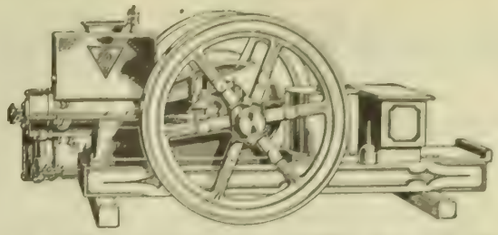
Salt added to the ration improves the flavor of the feed and may cause more to be eaten, but it does not seem to cause a larger per cent. to be digested.

* * *

Carrying too far inbreeding impairs constitutional vigor and sometimes makes animals infertile, but when done with care and intelligence it is a means of fixing certain desirable characteristics.

ALPHA

The Best Gas Engine to Buy



WHEN selecting a gas engine, the most important thing is to get a good engine. There is no economy in buying an engine that is going to require frequent repairs and that is likely to balk just at the time you need most to use it.

The wise man considers service, reliability and durability first, and price second. Selected on this basis, the ALPHA is the logical engine to choose, because it is the simplest and most durable in construction and the most reliable in operation. It runs smoothly and powerfully on a minimum consumption of either gasoline or kerosene, and operates on a simple magneto without the use of any batteries.

It is so simple that a woman or a boy can start and operate it, and the sensitive governor, which acts the instant there is the slightest variation in the load, insures steady running without any waste of fuel.

Before you put any money into a gas engine, investigate the ALPHA—and remember that the man who buys the best is never sorry.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, sawing, traction or portable style, and with hopper or tank cooled cylinder.

Other Westclox: Baby Ben, Pocket Ben, America, Big Ben Sleep-Meter, Lookout and Vanguard

THE HORSE

SOME STABLE VICES AND WHIMS

Many horses have the habit of rolling in the stable. This somewhat dangerous for the horse, as he is likely to get fast, particularly if his stall is rather narrow. When the horse attempts to roll and stays over on his back the stall is too narrow for him to go on over, so he cannot get up, and as it is often impossible for him to roll back, he gets fast. The longer he struggles while lying on his back the worse his conditions becomes. This habit is due perhaps to lack of opportunity to roll. The horse should be turned to a paddock for a few minutes each evening so that he may frolic. To overcome the habit, secure a small ring and sew it in the top of the halter. Suspend a small rope from a beam or the ceiling so that it will hang directly over the horse's shoulders when standing at the manger. Attach a snap to the lower end of the rope and snap into the ring at the top of the halter. This rope should be of sufficient length to allow the horse to get his nose to the ground about where his front feet usually stand. This appliance will permit the horse to lie down, get up and do as much as he likes, but he cannot place the top of his head to the ground. As he can not roll without first placing the top of his head on the ground this is a very efficient arrangement for over-coming the habit. To lead the horse from the stable, it is only necessary to unsnap the rope at the top of the halter and untie the halter.

Pawing with the Forefeet.—This is a disagreeable habit, usually due to insufficient exercise or to restlessness when the animal is left alone in the stable. It causes useless fatigue and a rapid wearing out of the shoes. The noise that the horse makes while pawing is almost unbearable, especially at night. To avoid the habit exercise the horse regularly. To overcome it, buckle a leg strap around the foreleg just above the knee and from it suspend a block of wood about two inches square and four inches long, so that it will hang about the middle of the cannon.

When the horse attempts to paw, the block strikes him. In case the horse is very sensitive substitute a corncob for the block. Another good plan is to use a heavy strap provided with a buckle at either end and buckle the two forelegs together. This strap should be of the proper length to permit the horse to stand normally. With this appliance he can lie down, get up, move backward and forward, but is unable to paw. Some horses that paw badly in a common stall will cease if placed in a box stall, particularly if bedded with sawdust.

Rubbing the Tail.—Many horses acquire the habit of rubbing the tail against the sides of the stall or other surrounding objects. This is very undesirable, as the hairs soon become tangled, break off and disfigure the tail. While there may be several causes for it, the principal ones are intestinal troubles, mange or unclean skin, causing intense itching, and infirmities of temper. To overcome the habit the treatment will vary according to the cause. If due to intestinal worms they must be removed, when the horse will cease to rub his tail; if due to mange or dirty skin, the disease must be cured and the skin kept clean; whereas, if due to temper other means must be employed. Some horsemen recommend the applying of a bandage around the dock, while others suggest tying two or three separate pieces of tape or ribbon around the tail, one near the tail-head, a second near the middle of the tail-bone and a third near the lower end of the bone.

Chewing Tie-Strap.—Occasionally the horse contracts the habit of chewing his tie-strap. It is probably due to the salty taste of the leather, as he usually begins by licking and finally takes to chewing the strap. To overcome the habit some horsemen recommend to keep rock salt before the horse for him to lick, although the best plan seems to be that of substituting a chain for the leather strap.

Gorging Grain.—Many horses have the disagreeable habit of gorging their grain and swallowing it without mastication. This may result in fatal colic. To overcome the habit give the horse a drink and feed some hay before feeding the grain. Another very good plan is to feed the grain in a rather large, flat-bottomed grain box provided with pockets, as this arrangement prevents the horse from getting much grain at a mouthful. Some horsemen recommend placing round stones in the grain box, but the confirmed grain gorger is usually an adept at throwing stones out before eating the grain.

CASE OF "CONTRACTED FEET"

A correspondent says: "We have a young horse which is stiff in his front legs. He appears to be sore in his front feet and in traveling goes forward on his toes. His hoofs are dry and feverish and grow fast. The horn is not flat, but straight up and down. What had we better do for him

This is no doubt a case of navicular disease, sometimes called contracted feet. A writer in a recent number of a veterinary paper discusses this disease as follows.

As is very well know, a horse suffering from navicular disease goes on his toes; this is to save the back part of the foot, where the disease is; the horse consequently goes lamer down hill. when the heel comes in contact with the ground first, and receives the jar and jolt mostly on this spot; in laminitis, it is directly the reverse; the chief seat of this disease is all round the front and sides of the foot, consequently the animal goes on his heel to save the front, and is lamer going up hill when the toe strikes the ground first and receives the most jar and concussion. The treatment I have prescribed must be continued until there is improvement in the animal's movements. When this is noticeable, it proves that the inflamed and congested condition of the foot is subsiding. If the shoes have not been removed, have them taken off now (this must be always done the moment it is practicable). If the horse lies down in the early stage, it is an excellent opportunity to remove them, which must not be lost. When it is certain the horse is improving, reduce the medicine to half doses, then to twice a day, and so on until it is gradually stopped. I am no medicine fiend, and the less we can do with the better. Medicine must, however, be given, and is an urgent necessity in very many cases, but lots of horses are made much worse and often killed by the continuous and injudicious use of drugs. It is the same with man; there are hundreds, yes, thousands of medicine cranks who would rather take a pull out of a medicine bottle, or swallow pills or tablets, than drink a glass of "old crusted." It was only a short time ago that one of these "walking drug stores" told me that he felt much worse that morning, although he had taken sixty-three little globules. I told him to go and order a coffin. Medicine, as I say, is a necessity, but directly you see that nature (the great doctor) is stopping in, stop the medicine, or reduce it, and leave the rest to this kind nature and good nursing.

If the appetite does not come on as it should, a few doses of the following will generally stimulate it:

Sulphate of quinine, 0 grains; sweet spirits of nitre, 1 ounce; tincture of gentian, 1 ounce; cold water, 6 ounces.

This may be given three times a day for a few days, or until the appetite returns, about half an hour before meals. When the patient gets so that he can walk about, the best thing to do is to turn him out into a soft, swampy meadow. I do not mean a place where he will sink to his knees and hocks at every step, but a nice, soft, cool place with dry places where he can lie down, and which he will always find out when he wants to, for a horse likes a wet bed to lie on just as much as a man does. After he has been out for ten days or a fortnight, apply the following excellent blister to the coronets. Of course, he will have to be taken up from pasture to have the blister put on and kept up for a week or so, and then turned out again until he has thoroughly recovered.

Biniodide of mercury, 1 drachm; powdered cantharides, 2 drachms; lard 3 ounces.

Mix thoroughly together and use as directed.

SEVERED TENDONS

Have a horse that had the tendons of his hind leg cut half way between fetlock and hock during last July. When it healed the tendon healed either too long or else they are weak, for when he steps on his foot it pains him and he keeps his foot well forward all of the time. If he puts his whole weight on it the fetlock rests nearly on the ground.

We still have a long shoe on him with a rod upthe back of leg, which holds foot in very nearly proper position.

The above symptoms are noticed when the shoe is taken off to reset.

One veterinary advised to recut and sew tendon, while another says that if we keep foot in proper position the tendon will get strong.

What would you advise?—M. H. F.

You say the tendons were cut. Now if both tendons are completely severed it will take a long time to effect a cure and probably the animal will never recover enough to be of any use.

I don't think it would be advisable to have the tendons recut and operated on, as you would find a lot of adhesions which would be quite difficult to disect, and also the healing would be tardy. I would advise keeping the long shoe on him and apply some stimulating liniment to the part if it is healed up.

The horse should have been put in a sling when the accident occurred and kept there until union of the tendons took place. I treated one last summer and he made a good recovery in three months.

The horses known in various localities as Hambletonians trace to the stallion known as Rysdyke's Hambletonian, or Hambletonian, or Hambletonian 10th. They are the best-known family of American trotting horses. Hambletonian 10th was foaled in 1849 and died in 1876. It is said that during his 21 years of service his fees amounted to over $185,000. Hambletonian 10th was sired by Abdallah by Mambrino, a son of imp. Messenger, a Thoroughbred horse of considerable note. His dam was a granddaughter of imp. Bellfounder and traced to imp. Messenger at least twice, so that Hambletonian 10th was largely of Thoroughbred origin. More trotting horses of the present day trace to Hambletonian 10th than to any other horse, and he is the founder of by far the most noted family of that breed.—Reply by Prof. E. A. Trowbridge, University of Missouri.

LAME HORSES PUT BACK TO WORK QUICK

TRY Kendall's Spavin Cure. It has *saved* a great many horses—has put them back to work even after they had been given up. Over 35 years of success has *proved* the merit of

KENDALL'S Spavin Cure

HUNTSVILLE, ONT., March 9th, 1916.
I have used a good many bottles of Kendall's Spavin Cure for sprains and lameness and I do not think it has an equal, especially in stubborn cases. Kindly send me a copy of your *Treatise on the Horse.* G. T. YOUNG.

NASAL AND THROAT CATARRH

Cured by

VENO'S LIGHTNING COUGH CURE.

As a remedy for Catarrh in all its various forms, Veno's Lightning Cough Cure is incomparable. The healing principles in Veno's soothe the irritated surfaces of the air passages, and restore the mucous membrane to healthy, natural action. Then the stopped-up feeling, the morning cough, and constant clearing of the throat, so characteristic of nasal and throat catarrh, are soon overcome and cure follows, more or less rapidly according to the severity of the case. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

The Fact

That in spite of war conditions our December attendance far exceeds that of any previous year of our 49 years' history, is prized, with much gratitude, as evidence of public appreciation of work faithfully performed.

Our New Term begins Wednesday, January 3rd.

POULTRY.

THE PRINCE EDWARD ISLAND EGG & POULTRY SITUATION

According to the Canadian Census and statistics, Prince Edward Island had 760,939 head of poultry valued at $275,172 in 1911, an increase of 179,149 head, or 30.79% over the figures for 1901, and this Island flock produced eggs to the value of $563,426.

On account of the many channels through which eggs and poultry are marketed today, it is difficult to arrive at the exact or even approximate production of Prince Edward Island. We do know, however, that the price paid to the producer—the farmer—has doubled and trebled in the last five years until today the farmer is receiving 45c per dozen for fresh gathered eggs right at his door.

It is true that in the ordinary processes of development the value of eggs would not have been so rapid, because, as is very generally known, Prince Edward Island has been, and is still to some extent, handicapped in marketing her produce by being cut off from the mainland. A new feature entered into our poultry business in September, 1912, when the Live Stock Branch of the Department of Agriculture commenced an educational campaign, which was responsible for the formation of Egg Circles, and the fostering of the idea of marketing co-operatively.

The Prince Edward Island Co-operative Egg & Poultry Association with headquarters at Charlottetown, is today the result of the work instituted by the Department of Agriculture in 1912, and carried on for three years under the supervision of Mr. T. A. Benson. Since August, 1915, Mr. Kerr has been continuing this work, and today Prince Edward Island has fifty-one Egg Circles with a membership of over three thousand five hundred.

The eggs produced on the farm operated by these Egg Circle members are shipped to a Central Candling Station in Charlottetown, and from there go to Boston, St. John, Halifax, Quebec, Montreal, and other market centres. This fall, shipments have also been made to Manchester, England, and Glasgow, Scotland.

It is anticipated that fully a quarter of a million dollar's worth of eggs will pass through the Candling Station this year. This figure must not be taken as the value of the eggs produced on the Island, as probably 60% of the eggs produced find their way to the market through other channels and it is not too much to say that some of these eggs could almost find their own way about.

The value of eggs produced according to the census for 1911 amounted to $563,426, and this year there has been marketed co-operatively eggs to the value of $250,000 produced by 3,500 farm flocks, less than 25% of the farm flocks of Prince Edward Island.

The co-operative movement has taken a firm hold in Prince Edward Island, and has indirectly benefited non-members as well as members, on account of the loss of this trade to wholesalers. Dealers are out each season in ever increasing numbers to buy up the Island eggs and poultry, and on account of the prices paid by the Co-operative Association, they have had to raise their prices, in order to get the supplies necessary to keep them in the running in this particular business.

This fall the Association is buying live chicken and fowl, paying a flat price for it on receipt, and after killing, dressing and marketing, and deducting the price of handling, returning a balance to the producer. In the

MRS. SPARROW'S RIVAL

A Good Object Lesson Story for Jealous Wives

By Emma Gary Wallace

"I suppose," complained little Mrs. Sparrow in her peculiar piping voice, "that men will go right on chasing pretty faces and pleasing manners to the end of time, while we women who stay home and dig and work need not expect so much as a 'thank you.' Why, only yesterday when I reminded Sam that I had baked four-hundred-and-five pies, nine-hundred-and-eleven cookies, three-hundred-and-fifty loaves of bread, twenty-eight layer cakes, ninety-seven sponge cakes, and had pared and boiled twenty-seven bushels of potatoes, and fried and roasted and stewed nearly three-hundred pounds of meat, all in the last year, he just grunted and then said that I ought to be mighty glad he was such a good pervider!"

Mrs. Sparrow's beady, black eyes snapped with indignation at the lack of appreciation of her liege lord. Her hair was drawn tightly back and twisted into a hard knot; her scant, calico dress showed the angles of her small, spare frame; and the expression of her sallow face was one of discontent.

"I might as well tell you, first as last," Mrs. Sparrow continued, addressing her sister, Maria Smithers, who had come to spend a couple of weeks with her, "that Sam is making a regular fool of himself around this schoolteacher boarder of ours. He talks and laughs with her every meal, and acts just as though he was tickled to death to have her around."

Maria raised her eyebrows and pursed her lips.

"She's a good looker all right," she agreed. "I do think her hair is the yellowest, her eyes the bluest, and her skin the whitest and pinkest I ever saw, and she can tell stories in a way to make anybody laugh."

"I know it," Mrs. Sparrow chirped, "and Sam seems delighted to hear her. I don't think I'll take a boarder after this term. There's no fool like an old fool, you know."

Maria Smithers was a widow in comfortable circumstances. She was fair, fat, and forty—a different type altogether from her sister, whom she now looked at critically.

"Don't believe I'd send her somewhere else, fi I were in your place, Salina," she warned. "Better let her be where she is so you can keep your eye on the both of them. And say, what's the matter with prinking up a little yourself? You used to be a pretty good-looking girl when Sam first took a shine to you. Lately you have stuck so close to the farm and the farm work that you're not half as interestin' as you might be—sort of weazened and dull-like, you know."

Salina Sparrow fairly fluttered with excitement.

"What time have I to prink up," she sputtered, "with all these hands to cook for?"

"That's very true," Maria agreed, "but Sam has urged you again and again to have a hired girl. Why don't you do it I don't believe Sam cares a thing about that schoolteacher, except that she's good company. Be good company yourself, and don't let her cut you out with Sam. It's perfectly natural he should like good company. I do myself, don't you?"

Salina perched on the edge of a high stool which stood by the kitchen sink, and looked at her sister thoughtfully.

"Hired girls are likely to be awful wasteful and extravagant," she mourned.

"Not necessarily," Maria defended. "You'll be right here to see to things and to do the plannin'. Tell you what, if I were in your place, I would comb my hair a little dicerent for one thing. That wouldn't take any time, or cost you a cent! Make it loose and fluffy around your face. This afternoon I'll give it a shampoo, and we'll dry it out in the open air, and I'll fix it pretty, just as you used to wear it. Why, it was real curly when you were a girl. It would hang in ringlets now, if you would give it a chance. No need of slickin' it back till you look like a skinned cat, as I can see.

"I don't like to hurt your feelin's, Salina, but those work dresses of yours are the ugliest things I ever did see! Why couldn't you have two or three becomingly full and of pretty color? Those are drab and streaky and make you look like you'd lost your last friend.

"Lately you've been as yellow as a duck's foot, just because you eat so much fried stuff and don't pay any attention to your liver. Why don't you get after yourself, drink plenty of fresh water, and get Sam to sleeping with wide-open windows? And talk about shoes! Those things you wear are neither beautiful nor comfortable. Why don't you have a pair of house slippers and a heavy pair of elastic-sided, loose shoes to slip into when you go out to feed the chickens? Land sakes alive, you ought to hear yourself clump around in those "

Salina gasped and her eyes opened wide, but undismayed her sister continued:

"Then, you say that teacher's conversation interests Sam. Honest, now, can you wonder? She talks about the war and woman's suffrage, and the next presidential election, and tells funny stories just when they seem to fit in. Why, the other night she was over to Mrs. Allen's to supper when I was there, and we clean forgot to pick up the dishes and wash them, listening to her telling about the Aztecs. I never knew much about them, and I tell you they were a great people.

"Now, if you had a hired girl, you could read some, and it would be a heap sight more interesting to Sam to have you able to talk with him about what's goin' on in the world, than to number the bites of pie and meat and potato he puts into his mouth, and to keep holdin' before him what an abused creature you are. It isn't cheerful to hear

"Be more of a companion and partner and be attractive to the eye, Salina, and Sam would never think of lookin' at the handsomest girl in the world. Why, he picked you out because he wanted you. He admires the teacher just as he would a beautiful rose, or a good, fat, yearling calf, but when it comes right down to brass tacks, it's 'Ma' he calls for every time he comes into this house, and the prettiest girl in the world couldn't take your place.

"Just the same, you're missin' half of the pleasure of life, just because you are too serious-minded. It's all right, Salina, to be thrifty and to have a competence for old age, but why not have some fun as you go along now? Sam's been wantin' to get an automobile, and you've fairly pecked his eyes out every time he mentioned it. Why not? You sure can afford it!"

Salina Sparrow hopped off the edge of the stool and took down the little square mirror from back of the sink. She went over to the window by the dining room door and looked at herself critically, turning her head first on one side and then on the other. Then she turned resolutely to her sister.

"My front teeth need filling, all right," she ejaculated, "and I guess it wouldn't hurt my skin to have some of that lotion that always used to take the redness out of it. Perhaps I have neglected myself a little bit. Suppose, Maria, you help me fix up. We'll take old Dolly and drive to town this afternoon, and perhaps you can kind of appear to coax me around on the automobile question. It's just as you say, we might as well take some comfort as we go along, now we are able to afford it. P'raps it wouldn't be such an expense, for Sam could use it a lot."

Maria Smithers eyed her sister's spare back and shoulders approvingly, as she reached to hang the mirror up again, and when Salina Sparrow turned around her sister brought a flush of pleasure to her face by saying:

"All right, Salina, I'll make you look ten years younger, and Sam'll be tickled to pieces. You've got the good, sound sense I always knew you had! I know right where you can get a first-class girl to help you, and she won't charge great big wages either! And we'll study this schoolteacher rival of ours, and where she can give us beauty hints, we'll take 'em, Salina. Sure we will! She isn't to blame because she's pretty, and we've no reason to spite her for it.

"What do you say to housedresses of blue and white, or lavender and white, with aprons of the same goods, and comfortable, pretty kid slippers with buckles? And afternoon dresses of dimity and lawn, and a thin silk shirtwaist suit, and long motor coat and cap and veil?"

"Oh, Maria, but that'll cost a lot," protested Salina, her cheeks pink with pleasure, in spite of herself.

"And white aprons with frilly edges, and some pretty lack neck things, and a wrist watch, and—"

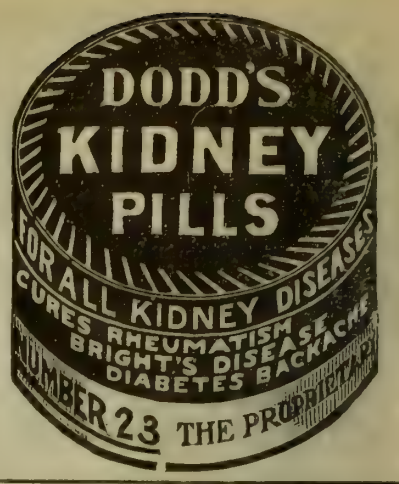
"Oh, not a wrist watch, Maria. There's Grandfather Brown's big silver watch—it'll do well enough."

"The teacher has a wrist watch Salina," her sister returned severely. "Sam approves of her. Why shouldn't you have a wrist watch? Think of his new silo and motor tractor and gasoline engine. 'Course you'll have a wrist watch!

"And I haven't heard you sing in ages, nor play. Why, the teacher's give her eyes if she could sing like a bird, as you can. Wake up, Salina! Which'll cost more—to let Sam get to thinkin' you're a machine to stamp out cookies and fry meat or to spend a few little, old dollars and be the queen bee of this home? Take your choice!"

Salina Sparrow broke into a happy, little laugh. It had the trill in it of earlier days. The complaining note of self-pity was gone.

"Sam's all right," she declared. "I reckon I've been sort of stupid, because I keep my eyes on the ground so much, lookin' for worms. Guess I'll have my shirtwaist suit of blue foulard with old rose figures, an' long sleeves, because my arms are so skinny. A wrist watch'll look good with a rig like that!"



HOW ORGANIZATION HAS SAVED BELGIUM

Canadian Officer Expresses Admiration for Belgian Relief Work

New York, Dec. —"The most wonderful thing about this war is the organizations it has developed," said a Canadian officer, on his arrival here to-day, "and the most wonderful, or at least one of the most wonderful, of these organizations is the Belgian Relief Committee."

This officer, who in private life is a prominent business man, has spent a great deal of time on the Belgian front and while engaged in work with the Canadian Army Service Corps had excellent opportunity to study the methods by which seven millions of destitute Belgians are being kept from starvation through the relief work.

"Our own system is about as good as they make them," he said, "but then we have the Government behind us and the Government has got to look after the "Tommies." But here are these people, with only their own energy and the loyalty of their contributors to depend on, carrying out a gigantic task with an efficiency and a cheerfulness that would put to shame the average business organization.

"Why do you know that they have got practically every one of these seven millions of people card-indexed? Well, they have, and they know just who is entitled to food and to how much each is entitled. And each person gets just that much, no more, no less. Believe me, there isn't enough wastage in the whole territory that organization covers to make a tin of cleansing powder!

"When I was last in Montreal I was frankly skeptical about what the peo-

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Influenza

Nothing I know of will give such prompt relief from this disease as Chamberlain's Cough Remedy. The pain in the chest disappears, the fever goes down, and the whole body feels better. After effects of the disease can also be avoided by taking

Chamberlain's Cough Remedy

I have never known a single case of influenza to result in pneumonia when Chamberlain's was freely given, and the cough following influenza speedily yields to this splendid remedy.

Yours for health,

—Granny Chamberlain.

"I earn $2 a day at home"

You may say that, too—if you want more income. Easy to learn. Steady work at home *the year round.* Write Auto-Knitter Hosiery (Canada) Co., Ltd. Dept. 306 F 257 College St., Toronto.

ple at the Belgian Relief Committee office at 59 St. Peter stre t told me they could do with a bag of flour. They said a bag of flour would feed one of the war sufferers for a month. Frankly, I didn't believe it, considering the cost of getting it there and the difficulty of turning it into food. But now I know they can do t. I've seen it done. Do you know what they do? They simply put the men to work making the flour into bread to feed their own families.

"But they tell me that with the Germans carrying off the Belgian men the way they're doing now, the job is going to be all the harder and there's going to be all the more need of help. Well, believe me, anyone who wants his Christmas money to go where it will do the most good had better send it to the Belgian Relief Committee."

WARM SCHOOL LUNCHES

Beulah S. Oxton

Last winter I read with much interest an article in your department concerning ways of furnishing warm dinners to school children who cannot go home for the midday meal. Having been a teacher for some years, and having spent part of that time in the rural schools, I appreciated the valuable suggestions in the article referred to.

In my own schools I very often found pupils who came long distances to school, and who were unable to eat much nourishing food for breakfast, due to the early hour at which they left home and also the excitement and nervousness attendant upon the hurry and bustle of getting off. When they reached the schoolhouse they were tired and hungry and in no condition to begin study. In that case they often ate a large part of their dinners either before school began or at recess, so when dinner time arrived they had little in their lunch boxes to sustain them for the afternoon and the long walk back home at night.

In such cases I tried to have a cup of hot milk or cocoa ready for them to drink upon arriving at school in the morning and the same at noon.

I always carried with me as part of my school outfit a one-wick small oil stove, a granite iron saucepan with handle and cover and a copper teakettle; a granite iron (white) cup and plate, large and small spoon, knife and fork. These all fitted snugly in a wooden box with slide cover. Another small box contained a can of condensed milk, can of cocoa, and a jar of beef extract, together with an assortment of crackers and fancy cookies, some wax paper and paper napkins.

On cold, stormy or busy days I could prepare in less than 10 minutes a cup of hot soup with crackers and a cup of cocoa with a dainty fig bar or cooky. For variety I took a fresh egg from my boarding place and boiled it, or a bit of steak which I cooked in my covered saucepan. Salt and pepper in envelopes I kept in a desk drawer to be used when needed.

The soiled dishes were immediately rinsed with cold water and then boiling water and dried in the air or upon a paper napkin. Thus in an hour's nooning I had cooked and eaten dinner, washed the dishes, and had at least half the time left for work or rest. Besides, I was not bothered by carrying a lunch box back and forth, and kept my health in good condition by eating a warm midday meal in the quiet of the schoolroom, or, if in summer, under the shade of a tree.

Now it seems to me that some such plan could be carried out for the pupils as well as the teacher. Some older pupil could make the soup and cocoa for all the others. A can of condensed milk and one of cocoa would last several pupils several weeks. The need to bring milk and sugar would be obviated, and much time and trouble saved. Concentrated soup can now be obtained in powdered form or in capsules that are soluble in hot water, which, with cracker added, forms a most nourishing meal.

There was once an old lady living near a rural school who was interested in the children, and upon cold days she often invited them to bring their lunch boxes into her warm kitchen and eat their dinner there. She put their bread and butter in the oven and toasted it, made them something warm to drink, and often gave them a "tidbit" in the form of jelly, cookies, preserves, fruit, cold headcheese, and many other dainties. While this old lady out of her kind heart and open hand did this for the children, under other circumstances she could have been hired by the parents to do the same for a small sum each week, which, divided among several families, would have been but a mere trifle.

There are many, many ways to keep the children well and happy and interested in school work. The parents and teachers should more often plan and work together, and in most places this can be done if the teacher is wise enough to see the need, grasp the opportunities and take the initiative.

Two other things I have found of great help in school: Window boards of various sizes to slip in the space under a raised window, thus giving fresh air up between the sashes without direct draft upon pupils; the other—dustcloths slightly dampened with kerosene will keep the boards clean and black and prevent dust.

COMMON COLDS

Knowing how frequently the common cold is followed by serious consequences, it must be regarded as a serious disease.

Tuberculosis, pneumonia, and influenza cause many deaths, and in most instances they begin with a common cold. It may, therefore, be said that a cold is the first stage of a tuberculosis, a pneumonia or an influenza—not simply because that group of symptoms known as a cold usually precedes them, but because of the fact that 75 per cent or more of common colds are infections with the specific germs of pneumonia, or influenza, or both—not so commonly tuberculosis, though the way is most beautifully paved for it and it frequently follows promptly.

Consumption, in the majority of instances, is but the terminal stage of what was once "only a cold."

Colds are largely preventable and being so, the preventive measures cannot be too strongly emphasized, or too oft repeated, until we not only learn them well, but practice according to our knowledge.

First and foremost in avoiding colds comes physical resistance. Some are richly endowed with this by nature, others must develop it. This is best done by simply following the well-known rules of hygiene and sanitation, which will not only serve to protect us against colds but all diseases.

Get plenty of fresh air—when you cannot go out into it let it come in to you.

Drink liberally of pure water.

Get sufficient sleep, and be regular about the hours. Wear a sleeping cap in cold weather.

Take exercise, avoiding the strenuous kinds. And if you can walk, don't try to find any better kind. You need not confine yourself to this form, but don't overlook the value of it.

Eat good food, remembering that it is very easy and detrimental to overeat. Eat anything you like—unless you know it doesn't agree with you, but sparingly of meat and eggs, which predispose to colds and other ills. Practice frequent bathing, especially the daily cold water kind—either tub, sponge, or shower—followed by a vigorous rubbing with a coarse towel. The bath is of much more value if taken in the morning.

Wear comfortable clothing, but unless your work is out of doors, avoid heavy underwear. Secure the extra protection necessary in cold weather with outer garments, which can be easily removed when inside. Don't start the muffler habit next winter.

Never wear thin soled shoes, they are always tiresome and dangerous.

Abstain from alcohol—there is nothing more destructive to your defences.

Avoid fatigue if possible, as your resistance is materially lowered, when the body is overtired.

Public gatherings are a prolific source of infection. Movie fans should attend the first show—the air is better. Your risk is further lessened if you keep your mouth closed. Look and listen, but do not talk. Breathe through the nose, and after returning home spray the nose and throat with some antiseptic solution. During the season when artificial heat is necessary, maintain the moisture in your rooms by evaporating water. Completely change the air several time daily.

Properly care for the teeth.

Be careful in using public phones. Avoid a contact of your lips with the transmitter.

And so we might go on indefinitely with what to do and what not to do. Simply learn all you can of what tends to preserve and promote health, and what tends to destroy it. Then form healthful habits and your reward is certain. In the event that you get a bad cold, you cannot do better than to give your attention to getting rid of it—in the shortest possible time—for the longer a cold hangs on the greater its tendency to become chronic

—or to be followed by complications.

A bad cold is a disease demanding home care and treatment. Don't try to work it off—for in so doing you are using in your activity the energy which should be used to combat the infection, and aiding in your own defeat. Begin treatment by thoroughly cleansing the bowels with a saline cathartic, such as Epsom salts.

Take a hot bath of about ten or fifteen minutes duration, and before concluding it gradually reduce the temperature of the water to that of the body. Drink all the hot water you can and go to bed. You will do better without food for the first twenty-four hours. However, if you feel that to be too much of a hardship you may have a liquid diet, and three or four times daily take about one-third of a teaspoonful of baking soda.

Continue along these lines, drinking liberally of water, until the acute symptoms which characterize the onset of the trouble have subsided, and then gradually resume your regular habits.

Should unusual symptoms follow, or should you not respond promptly to the treatment outlined above, call a physician.

WASHABLE THINGS

For very little children who are apt to put everything they handle in their mouths, playthings should be selected that can be washed easily. Many people think the best playthings are those that cost a great deal of money, but in reality the best ones are made at home and cost next to nothing.

A clothespin dressed in long clothes for a doll will delight a baby and the whole thing can be washed and boiled on wash day. Small wooden boxes of various sizes are always liked by babies for building all sorts of houses and these can also be washed. One of the best things a lively baby ever had to play with was a box in which prepared food had come—a round box that would roll. The mother peeled all the bright paper from it and the baby played for hours with the toy that would slip from his grasp and roll away. When soiled it was wiped off and the baby started after it again.

In things that are bought rubber toys are lasting and washable and so are many of the wooden ones. A bright bell made of metal costs little and can be washed without trouble. Iron toys are hardly to be recommended for very little children as they are apt to hurt themselves with them, but when they are old enough to handle them with care the toys are easily cleaned.

Wooden blocks that are not highly painted are good playthings for children if not too heavy. Large glass marbles to roll after the little ones know enough not to throw them and hard rubber balls are alike useful. It is fine exercise to roll a ball and run after it, but the balls get dirty speedily and must be washed. Small baskets to carry things in will please the baby and they are easily washed. A little basket that has been scrubbed and dried many times while the baby had his nap is the pet plaything of a sturdy youngster of two years. Berry boxes make hats and toys and houses and many other things for babies, but they should be examined carefully for loose tacks before being turned into playthings.

Spools of all sizes make good toys, a string of spools pleasing the baby better than a rattle bought at the store. On wash day drop the spools in hot suds or boil them after the clothes are finished and they come out clean and white. Wooden harness rings free from paint and metal rings not painted are liked by little children. In fact, there are enough things thrown away in every farmhouse to furnish playthings for a dozen babies, and things that can be washed, too. A plaything that can't stand a bath is not fit for a baby no matter what it cost. It is impossible to keep everything perfectly clean all the time, but occasionally the baby's toys should be dumped into some clean hot suds so that they will not become filthy.—Alice Brown.

BOY'S SUIT.

By Anabel Worthington.

Very much in style this season is the Russian suit for a small boy. This type of suit has been well tried out and proves to be the most favored.

Your boy can go anywhere if decked out in a suit like the one in the picture. The blouse is made with a plait n each half of the back and the plaited section is joined to a yoke, giving a very pretty line across the shoulders. At front, a backward turning tuck is made at the left side, where the blouse fastens, as suggested by the button decoration; a similar row of buttons at the opposite side cleverly introduces the much loved double breasted effect.

The collar is detachable, and the tie, of course, makes the boy quite manly looking. The patch pocket will easily win Tommy or Johnny, but suit yourself about making the bloomer trousers with leg bands or elastics.

Serge, homespun, cheviot and the mixtures are good for this style, and the pattern promises an exact duplicate whether or not you have used a pattern before.

The suit pattern, No. 8,037, cuts in sizes 2, 4 and 6. To make in size 4 requires 2⅝ yards 36 inch material, with ⅜ yard contrasting goods.

APPRECIATING CHILDREN

To appreciate a child, it is necessary to understand it, yet many a parent fails to make a discriminating study of the characteristics of his child. The baby's actions, which speak louder than any words, and which would be of priceless value to the observant parent, are passed carelessly by. His sudden tempers are laughed at, his inquisitiveness is a joke, his affectionate ways are sweet, and his saucy airs are cunning, and that is all many parents think about them.

Now, a child, even a little one, instinctively feels when it is misunderstood, and sometimes children who have the finest qualities, shrink within themselves and show only a disagreeable and indifferent exterior, because they know that they are not appreciated. Appreciation is the very sunshine of the soul; it is when we feel that we are appreciated that we put forth our best efforts. It is only a rarely heroic soul who will fight on with the same valor when he knows that it is misunderstood, and that his best efforts are greeted only by a careless smile.

One might as well expect a child's body to thrive in a darkened room as to expect its soul to expand without loving appreciation. Appreciation means room to grow, unhindered and unretarded. It does not mean flattery, which would ruin the sweetest childnature ever made, though a well deserved word of praise will spur one to fresh endeavor, and it is as natural as breathing for a child to seek it.

'That is right', 'Well done.' 'Mamma was watching.' 'I saw how hard you tried.' It is surprising what a good effect such kindly and cordial phrases will have.

Never laugh at a child's aspirations. 'Tommy expects to be Prime Minister,'' or 'Bessie has decided to become a poet,'' you announce at the tea-table, and the statement is received with shouts of laughter; it seems so absurd that such round-cheeked, chubby little morsels should cherish such heroic dreams. But they are right, and you are wrong. It is impossible to set the goal too high, and it was a cruel shame for you to make that shy confidence which was breathed into your ear a subject of ridicule. And what the child suffered of mortification and confusion at your hands you do not even dream.

And when your little man or maid bestows upon you some trifling present—the photograph frame, clumsily carved maybe—or the handkerchief hemmed with grimy little stitches, look beyond the poverty of the gift to the motive which inspired it, and hold the trifling thing as precious in your sight.

If you surround your child by such an atmosphere you may be sure that every noble and lovely trait in his nature will have a chance to grow. And when he reaches maturity your loving patience will have its full reward.—Helping Words.

EDUCATING THE CHILD

A summary of a number of simple home means of education for children:

Hearing good stories at home.

Telling stories.

Dramatizing stories.

Keeping a diary.

Conducting a correspondence with a child friend or a loved member of the family.

Keeping a grocery, market and laundry list.

Labeling garden plots, seeds and home food supplies, such as jams, jellies and preserves.

Playing such games as "Anagrams," "Spelling match," "Quotations," "Authors" and "Word Building."

Keping a card file of picture post cards, noting interesting facts about each.

Reading the classics under home supervision.

Using the children's room of the local library intelligently.

Physiology and Hygiene Experiences

Caring for the body hygienically, bathing, brushing the teeth, manicuring the nails, and disinfecting eyes, ears, nose and throat.

Fashions Dept.

How to Order Patterns.

Order by number, giving age or measurement as required, and allowing at least ten days to receive pattern. Also state in which issue pattern appeared. If two numbers appear for the one suit, one for coat, the other for skirt, thirty cents must be sent. Address Fashion Department, "The Maritime Farmer, Sussex, N. B. Be sure to sign your name when ordering patterns. Many forget to do this.

Positively no patterns will be sold under 15 cents each, owing to advance in cost of same.

When ordering, please use this form:—

Send the following pattern to:

Name .....

Post Office.....

County .....

Province .....

Number of Pattern.....

Age (if child or misses' pattern).....

Measurement—Waist .....Bust.....

Date of issue in which pattern appeared. .....

LADY'S SHIRT WAIST.

By Anabel Worthington

According to the season's latest, No. 8,083, fashion still favors the practical mode in blouses. This is a really smart and serviceable design which the wearer proclaims is for "strictly business."

The model is on severely plain lines, has the front closing that may extend to the chin with the aid of a high turnover collar—if the open neck is preferred the collar is rolled as illustrated. The sleeve with plenty of fulness below the elbow is gathered into a fascinating cuff that finishes with a frill of the material. To give dash, the athletic girl will add the tie and it will be very becoming below the collar in opposing color.

If to match a suit this waist should properly be in the color of the suit material—for instance, if blue serge formed the skirt the waist would be of blue taffeta with a collar of sheer handkerchief linen. It may also be made of Georgette crêpe, plaid silk, cotton poplin, white linen, &c.

It is no secret that an amateur can reproduce the design without a bit of trouble—the result is well worth the effort it takes.

The waist pattern, No. 8,083, cuts in sizes 36 to 42. To make in size 36 requires 2¼ yards of 36 inch material and ¼ yard of 22 inch contrasting goods.

To obtain the pattern send to the office of this publication.

Learning to escape contagion through avoiding common drinking cups, handling car straps or stair railings of public buildings, indiscriminate kissing and touching the soiled clothing or hands of playmates.

Learning to like simple foods because of their nutrition.

Taking part in the cleaning of the home through keeping the playroom and playthings, as far as possible, sanitary.

Helping to bathe and dress a baby brother or sister.

Caring for pets of all kinds.

Science Experiences

Making and studying collections of stones, rocks, ores, deserted birds' nests, flowers, textiles, woods and shells.

Modeling physical maps in damp sand or plasticine.

Putting together cut-out geographical maps.

Playing card games of illustrated birds, flowers and trees.

Keeping a weather record or making an illustrated weather chart.

Studying the chemical reactions involved in simply home cooking.

Making toys that illustrate scientific facts; weather vanes, barometers, electric toys, water wheels and kites.

From the Mother's Magazine.

THE CARE OF LINOLEUM

Linoleum is made of linseed oil, rosin, ground cork, with mineral colouring matters. In cleansing and renovating linoleum, the ingredients should be taken into account. Therefore, linoleum should not be washed with soap, soda, or other alkaline cleansing agent. Neither should hot water be used on it. To clean linoleum properly, sweep it first gently, then wipe up with a damp cloth. The surface should be treated every two or three months with some good floor wax, well rubbed in. A solution that may be used to preserve and renovate linoleum is the following:—Dissolve two and a half pounds paraffin in one gallon of oil of turpentine, using gentle heat; apply while warm with a piece of flannel; let remain on the linoleum about twenty-four hours, then polish with flannel. New linoleum should be warmed before unrolling or bending, as it cracks very easily when cold. Furniture should not be rolled or skidded over linoleum, but lifted and carried. Small blocks or wood or scraps of linoleum placed under furniture casters prevent unsightly denting. The greatest amount of wear on linoleum comes naturally, from walking over it. Plain linoleum shows such wear much less than figured, which often becomes unsightly from "paths" and worn patches. This is especially true of the cheaper linoleums. When properly laid and cared for, however, the very best inlaid linoleums are quite satisfactory, and are the cheapest in the long run.—C. E. Vail, Colorado Agricultural College.

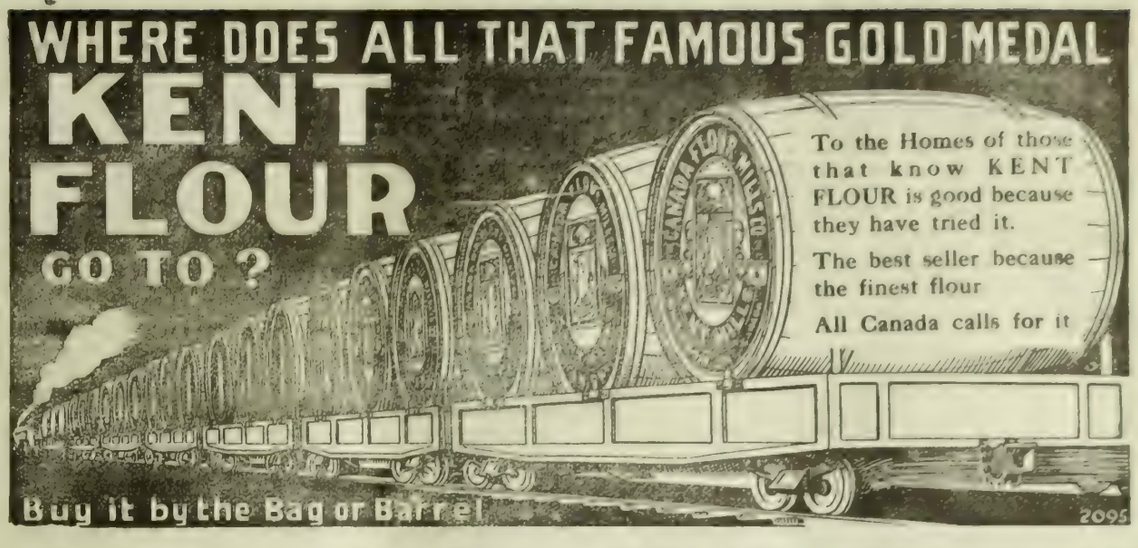
SQUIBS FROM A FARM WIFE'S NOTE BOOK

Never wring or twist silk after washing. Squeeze gently and roll up in a turkish towel. This will absorb the surplus moisture and leave the silk just right for ironing in an hour or two.

Nothing, probablf, is more healthful than the tomato, with its just-right acid, and there are so many ways of serving, both fresh and cooked, plain and in combination, that no one need tire of it.

There are wearisome hours these long summer days, but keeping the heart young is the best cosmetic for keeping the face young.

The best way to cream butter and sugar for a cake is to use the potato masher. In cool weather warm the butter (but do not melt it) and the mixing bowl.



WHERE DOES ALL THAT FAMOUS GOLD MEDAL
KENT
FLOUR
GO TO ?
To the Homes of those that know KENT FLOUR is good because they have tried it.
The best seller because the finest flour
All Canada calls for it
Buy it by the Bag or Barrel
2095

There are so many pretensions all about that plain, simple honesty is in contrast, particularly attractive.

This is the day of efficiency. The best butter, poultry, fruit, eggs and vegetables are what bring the top prices and guarantee the future market. It takes thought and care to provide these, but from all standpoints, it pays.

A film of butter spread over the cut surface of cheese that is to be put away, will prevent the drying and cracking that spoils its appearance.

There is no grain better than wheat for chickens. If they can have the run of the stubble field after threshing they will thrive at no extra cost. If this is not practicable, wheat should be fed them and charged up to their cost.

Promptness, dependability and attention to detail are the foundation of successful business and life, and they are best learned at home. In fact, the whole adult life will suffer if these habits are not well grounded in childhood.

In traveling, do not pack a bulky towel and washcloth with your toilet articles, to be carried there damp and soiled after using. Instead, cut five or ten cents worth of cheesecloth (depending on the length of your journey) into twelve inch squares, tuck them in corners of your suitcase (where they will take up no extra room) and have fresh, inexpensive towels and washcloth each time.

Keep a jar of beef extract on hand to help out the emergency dinner if the soup or sauce lacks flavor.

Make inexpensive covered buttons by covering cheap, four-holed buttons with the desired material.

Soggy fruit pies are an abomination. Lower crusts that are brushed over with white of egg (unbeaten) will not be soggy. A thin layer of finely grated bread crumbs is also good for taking up surplus moisture and will not be noticed in the baked pie.

It is foolish to be bothered with starch sticking to the irons when a little borax, soapy water, or some oily substance used in the making will prevent it.

Put the peaches you want to peel in a drainer or colander, dip in a kettle of boiling water then into cold and the skins will slip off easily and without waste.

When brass knobs on bedsteads become tarnished remove them and boil up in vinegar. Polish with a soft cloth.

Remove sewing machine oil from garments by wetting with turpentine, then washing with cold water and a mild, pure soap.—Mrs. F. A. N.

You are often missing the best fishing while travelling to another place.

Some men ask for advice in conducting their business for the sole purpose of having someone to blame if things go wrong.—Fame.

Silage has very much the same effect upon the cow's digestive apparatus as pasture grass.

* * *

There is a great need for the saving of more high class heifer calves on the farm. Good farmers cannot agord to let these youngsters go for veal or be killed for any reason.

* * *

If your home should catch fire today or tonight, have you a ladder handy to get on the roof? A strong ladder makes it possible to reach fire with little trouble. Always keep one handy.

* * *

Consciously or unconsciously all the labor and management are on a farm directed for the comfort and independence—the happiness of the home. If the machinery of the home runs smoothly and its occupants are contented, then the farm is efficient and prosperous.

* * *

The home water system should have a place on every farm. There is no question that the wife is entitled to a few of the improvements and when you figure up the weight of water that is carried into the house every day, it shows that she is almost a beast of burden. Why not put these conveniences at her disposal every day?

It's the man who reaches out and stops them who always has things coming his way.—The Show Globe.

Give the "Kiddies" All They Want of

CROWN BRAND CORN PURE SYRUP

It is one of the delicious "good things" that has a real food value.

A slice of your good homemade bread, spread with "Crown Brand", forms a perfectly balanced food, that is practically all nourishment.

So—let them have it on biscuits and pancakes, and on their porridge if they want it.

You'll like it, too, on Griddle Cakes—on Blanc Mange and Baked Apples. And you'll find it the most economical sweetener you can use, for Cakes, Cookies, Gingerbread and Pies.

Have your husband get a tin, the next time he is in town—a 5, 10 or 20 pound tin—or a 3 pound glass jar.

THE CANADA STARCH CO. LIMITED

MONTREAL, CARDINAL, BRANTFORD, FORT WILLIAM.

Makers of "Lily White" Corn Syrup—Benson's Corn Starch—and "Silver Gloss" Laundry Starch.

220

Our new recipe book, "Desserts and Candies", will show you how to make a lot of really delicious dishes with "Crown Brand". Write for a copy to our Montreal Office.

THE PRINCE EDWARD ISLAND EGG & POULTRY SITUATION

(Continued from page 183)

first three weeks of operating over two and a half tons of live poultry was received at the Candling Station.

It might be well here to issue a word of warning to poultrymen of the several provinces assembled here. There is a tndency this year, judging by the heavy deliveries of poultry on the large markets, for farmers and producers generally to deplete their flocks and by rushing a large quantity of birds to market in an unfinished condition, cause the current price to fall much below normal. This is no doubt due to the high price of feed, but even though feed is scarce and high, it would pay farmers well to finish their birds before offering them for sale and spread their deliveries over a longer period.

There have been, too, a large number of pullets noticed in many shipments. This is unfortunate considering the price of eggs, which is today several cents higher than the highest price reached any time during last winter. The very firm prospect for the profitabl marketing of all poultry products points to the necessity of conserving in every possible way all suitable laying and breeding stock.

The poultrymen assembled here will be glad to know that a very decided movement is being made on Prince Edward Island in favor of pure bred stock. They should remember, however, in catering to the trade in this stock that will develop, that a farmer is only going to buy such breeds or varieties as will be useful to him from a utility standpoint. While it is important that pure bred birds should conform to the standard, it is also of paramount importance to the farmer poultryman that these pure bred birds be of an egg laying strain. The farmer has no time to follow up the poultry shows, and at best will attend none but his local fair. It is eggs he is after, and the bird he buys must be able to pay a fair profit in eggs or meat over cost of feed. It is a good thing for the farmer to keep this point in mind and make an effort to breed bred-to-lay stock, that combines utility with the standard points necessary to mark a bird as pure bred. There will be an ever increasing demand from Prince Edward Island farmers for pure bred birds and eggs from pure bred birds, and the natural centres from which these birds will be drawn are New Brunswick and Nova Scotia. If the poultrymen of these two provinces are not sufficiently awake to grasp the opportunity, orders will go to Ontario, and the trade he lost to the Maritime Provinces.

An address by A. F. Heuston, president of the Maritime Poultry Association at their recent Convention in Moncton.

KINGS COUNTY POULTRY SHOW PRIZE LIST

The Kings County, N. S., Poultry Show ended on Friday night and it was recognized by all who attended that it was one of the best poultry shows ever held in the Province. The quality of the birds exhibited was unusually good and over 600 were entered and exhibited. Poultry fanciers considered it far above the average of County Shows. The display of S. C. White Leghorns was particularly fine.

It is regrettable that there were so few in attendance. Every bird fancier should have been there and also the farmers who might have learned much to help them make poultry an important part of the farm productive products.

Here we present the prize list:

Anconas—Cock, 1st, G. Blanchard; Hen, 1st, 2nd, G. Blanchard. Cockerel, 1st, 2nd, G. Blanchard. Pullet, 1st, 2nd, 3rd, G. Blanchard.

Andalusians—Hen, 1st, 2nd, Mrs. Blanchard. Cockerel, 1st, 2nd, Mrs. Blanchard. Pullet, 1st, 2nd, Mrs. Blanchard.

Campine, Golden—Cock, 1st, Mrs. Blanchard. Hen, 1st, 2nd, Mrs. Blanchard. Cockerel, 1st, 2nd, 3rd, Mrs. Blanchard. Pullet, 1st, 2nd, 3rd, Mrs. Blanchard.

Campine, Silver—Hen, 1st, Mrs. Blanchard. 2nd, W. R. Turner. Cockerel, 1st, W. R. Turner; 2nd, Home Industries. Pullet, 1st, Home Industries; 2nd, 3rd, Mrs. Blanchard.

Cochin, Black—Hen, 1st, E. J. Armstrong; Cockerel, 1st, 2nd, E. J. Armstrong. Pullet, 1st, E. J. Armstrong.

Cochin, White—Cock, 1st, E. J. Armstrong; hen, 1st, 2nd, E. J. Armstrong; cockerel, 1st, 2nd, E. J. Armstrong; pullet, 1st, 2nd, E. J. Armstrong.

Cochin, A. O. V.—Pullet, 1st, E. C. Griffin.

Game Cornish—Cockerel, 1st, E. C. Griffin; Pullet 1st, E. C. Griffin.

Hamburgs S. S.—Hen, 1st, Charles Dalton; 2nd, 3rd, G. A. Blanchard. Cockerel, 1st, 2nd, George Lockwood; 3rd, G. A. Blanchard. Pullet, 1st, 3rd, G. A. Blanchard; 2nd, Geo. Lockwood.

Hamburg, A O V—Cockerel, 1st, Charles Dalton. Pullet, 1st, Charles Dalton; 2nd, 3rd, George Lockwood.

Houdans—Cock, 1st, 2nd, Home Industries; 3rd, Frank Stead. Hen, 1st, 2nd, Home Industries; 3rd, 4th, Frank Stead. Pullet, 1st, Frank Stead.

Lakenvelders—Cock, 1st, E. J. Armstrong. Hen, 1st and 2nd, E .J. Armstrong.

Leghorns, White S. C.—Cock, 1st, 3rd, Ernest Craze; 2nd, J. Sutton. Hen, 1st, 2nd, Charles Johnston; 3rd, J. R. Lyons; 4th, Ernest Craze.

Cockerels, 1st, Charles Johnston; 2nd, 5th, Ernest Craze; 3rd, 6th, W. R. Turner; 4th, Evangeline Poultry Yards.

Pullet, 1st, 2nd, Mrs. Stanley Craze; 3rd, 6th, J. Howe Cox; 4th, G. A. Holmes; 5th, W. R. Turner.

Leghorns, White, R. C.—Cockerel, 1st, Thos. Tanner. Pullet, 1st, 2nd, Thos. Tanner.

Leghorns, Brown, S. C.—Cock, 1st. W. Plant; 2nd, G. A. Blanchard. Hen, 1st, 2nd, W. Plant; 3rd, G. A. Blanchard. Cockerel, 1st, G. A. Blanchard; 2nd, W. Plant. Pullet, 1st, 2nd, W. Plant; 3rd, G. A. Blanchard.

Leghorns, Buff, S. C.—Cockerel, 1st, Evangeline Poultry Yards. Pullet, 2nd, Evangeline Poultry Yards.

Leghorns, Black—Cock, 1st, Chas. Dalton. Hen, 1st, Charles Dalton. Cockerel, 1st, 2nd, Chas. Dalton. Pullet, 1st, 2nd, Chas. Dalton.

Minorcas, Black—Cock, 1st, A. A. Rottler; 2nd, Mrs. Blanchard. Hen, 1st, 2nd, 3rd, A. A. Rottler. Cockerel, 1st, 2nd, A. A. Rottler. Pullet, 1st, 2nd, 3rd, 4th, A. A. Rottler.

Langshans—Cock, 1st, A. L. Webster. Hen, 1st, 2nd, A. L. Webster; Cockerel, 1st, Robie Morine; 2nd, A. L. Webster. Pullet, 1st, 2nd, Robie Morine; 3rd, A. L. Webster.

Orpingtons, White—Cock, 1st, D. Hartley. Hen, 1st, 2nd, D. Hartley. Cockerel, 1st, Chas. Dalton. Pullet, 1st, 2nd, 3rd, Chas. Dalton.

Orpingtons, Buff—Cock, 1st, Home Industries. Hen, 1st, Home Industries. Cockerel, 1st, Home Industries; 2nd, Herbert Lyons. Pullet, 1st, 2nd, Home Industries; 3rd, Herbert Lyons.

Orpington, A. O. V.—Hen, 1st, 2nd, 3rd, E. T. Jordan. Cockerel, 1st, E. T. Jordan. Pullet, 1st, E. T. Jordan.

Polish, W. C. B.—Cock, 1st, E. J. Armstrong. Hen, 1st, 2nd, E. J. Armstrong. Cockerel, 1st, 2nd, E. J. Armstrong. Pullet 1st, E. J. Armstrong.

Polish A. O. V.—Cock, 1st, E. J. Armstrong. Hen, 1st, 2nd, E. J. Armstrong. Cockerel, 1st, E. J. Armstrong.

Plymouth Rock—Barred—All to E. T. Jordan except 4th. Pullet, Evangeline Poultry Yards.

Plymouth Rock—White—Hen, 1st, 2nd, Charles Dalton. Cockerel, 1st, Geo. A. Holmes. Pullet, 1st, George A. Holmes.

Plymouth Rock, Buff—Cock, 1st, G. Blanchard. Hen, 1st, 2nd, G. Blanchard; 3rd, W. R. Turner. Cockerel, 1st, W. R. Turner. Pullet, 1st, W. R. Turner; 2nd, 3rd, G. B. Blanchard.

Plymouth Rocks, A. O. V.—Cock, 1st, J. Kerwin. Hen, 1st, 3rd, J. Kerwin; 2nd, Chas. Dalton. Pullet, 1st, 2nd, T. Tanner.

Rhode Island Red S. C.—Cock, 1st, 2nd, E. C. Griffin; 3rd, R. Morine. Hen, 1st, 2nd, E. C. Griffin; 3rd, R. Morine. Cockerel, 1st, R. Morine; 2nd, 3rd, 4th, E. C. Griffin. Pullet, 1st, 2nd, 4th, R. Morine; 3rd, E. C. Griffin.

Rhode Island Reds, R. C.—Cock, 1st, E. C. Griffin. Hen, 1st, E. C. Griffin; 2nd, R. Morine. Cockerel, 1st, E. C. Griffin; 2nd, 3rd, R. Morine. Pullet, 1st, 2nd, 3rd, E. C. Griffin.

Red Caps—Hen, 2nd, 3rd, R. Morine. Pullet, 2nd, R. Morine.

Wyandotte—White—Cock, 1st, E. T. Jordan; 2nd, E. H. Dodge; 3rd, Evangeline Poultry Yards. Hen, 1st, 2nd, E. T. Gordan; 3rd E. H. Dodge. Cockerel, 1st, E. H. Dodge; 2nd, E. T. Jordan; 3rd, Evangeline Poultry Yards. Pullet, 1st, E. H. Dodge; 2nd, E. T. Jordan.

Wyandotte—Buff—Cock, 1st, T. A. Morine. Hen, 1st, T. A. Morine. Cockerel, 1st. T. A. Morine. Cockerel, 1st, 2nd, T. A. Morine. Pullet, 1st, 2nd, T. A. Morine.

Wyandotte—Columbian—Cock, 1st, Home Industries. Hen, 2nd, Home Industries. Cockerel, 1st, Evangeline Poultry Yards. Pullet, 1st, 2nd, Evangeline Poultry Yards.

Wyandotte, A. O. V.—Cock, 1st, Frank Stead; 2nd, Fred Morine. Hen, 1st, 2nd, 3rd, Frank Stead. Cockerel, 1st, F. Morine. Pullet, 1st, 2nd, L. B. Dodge; 3rd, Ivan Wagner; 4th, Frank Stead.

Any Other Variety—Cockerel, 1st, 2nd, E. C. Griffin. Pullet, 1st, E. C. Griffin.

Buttercups—Hen, 1st, 2nd, Mrs. Blanchard. Cockerel. 1st, 3rd, G. Blanchard; 2nd, Mrs. Blanchard. Pullet, 1st, 3rd, Mrs. Blanchard; 2nd, G. Blanchard.

Bantams, Cochin—Cock, 1st, E. C. Griffin. Hen, 1st, E. C. Griffin.

Orpingtons, 1st, N. A. Eaton. A. O. V., 1st, Mrs. R. Tilley; 2nd, A. L. Webster.

Utility—Pair Wyandotte Cockerels, 1st, E. H. Dodge; 2nd, L. B. Dodge. Pullets, 1st, L. B. Dodge.

Pair, Rock, Cockers, 1st, F. Godfrey; Pullets, 1st, F. W. Brady; 2nd, E. C. Griffin; 3rd, F. Godfrey.

Eggs—1 doz. white, shelled, E. Craze.

Special Prizes

Sir F. W. Borden Cup for best display in Mediterranean breeds, G. A. Blanchard.

W. W. Pineo Cup for the best display of Rhode Island Reds, E. C. Griffin.

W. S. Blair Cup for best display of Barred Rocks, E. T. Jordan.

T. P. Calkin Cup for best display of White Wyandottes, E. T. Jordan.

Best male in largest class, Ernest Craze.

Best display of any one variety, E. T. Jordan.

Best female in largest class, Mrs. Stanley Craze.

Show judged by Professor J. P. Landry of Truro.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. **If you** suffer from **pain in the head, back,** or **bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask for the free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS Box 309 WINDSOR, ONTARIO.

Pronounced by him to be one of the best, if not the best county shows in the province.

Attendance very wretched. Marked apathy being shown by everyone except the most enthusiastic poultrymen.

Dominion Government Egg Exhibit at shown under direction of Mr. J. Russell Fee of Ottawa, very instructive.

THE CANADIAN GOVERNMENT RAILWAY SYSTEM CLOSING THE BEST YEAR IN ITS HISTORY

Great Increase in Traffic and Large Surplus Probable—Additions to Rolling Stock and Precautions Against Snow Bockade—Superheating of Locomotives Results in Great Economy in Fuel—Little New Work at Moncton Shops as Capacity Is Taxed by Repairs and Renewals

The people of the Maritime Provinces in general and of Moncton in particular will be pleased to know that the Canadian Government Railway system is closing the best calendar year in its history.

It is generally known that the traffic last year showed a large increase, and the Minister will be able to present to Parliament a statement showing a large surplus, with the prospect of still better things for the current year. Of course the war traffic is abnormal and it may be considered the part of wisdom to devote this surplus to such improvements in the track and additions to the rolling stock as will meet any possible developments of the future. The greatest difficulty for some time past has been in getting locomotives and cars for moving the traffic, but General Manager Gutelius and his staff have been untiring in their efforts to accommodate the patrons of the road. Every locomotive has been worked to its capacity and while there has been some deay to freight there has been no blockade as on any of the Company roads of this Continent.

Perhaps the best test of good management is in the cost of moving traffic, and in this respect the Canadian Government system shows a steady improvement. Every effort has been made to improve the efficiency of the locomotive equipment with the result that there has been a material reduction in the cost of moving trains per ton mile.

In April last the average miles per locomotive on the line increased 57% and the engines in service averaged 3,568 miles each. The average of the train loads has been increased and a great saving in coal effected by superheating of the locomotives. Already 34 locomotives have been super-heated at the Moncton and River du Loup shops, mostly this year and the work will be continued. As super-heating requires new fire-box, new cylinders and partially new frames, it will be seen that it means a lot of work for the shops during the next few years. The Railway shops have been working full capacity throughout the year, as far as labor and materials have been available. Notwithstanding the drain of the war more men are employed in the different branches of the service than ever. 600 men are employed in the Moncton locomotive shops, 260 in the River du Loup locomotive shops and 1200 in the Moncton Car and Locomotive Shops. 135 men are employed in the Moncton Round House, not including firemen and drivers. 173 men have enlisted out of the operating department.

Additions are being made to the locomotive and car equipment of the Government Railways system as fast as the makers can deliver the orders. 55 new freight locomotives have been delivered this year or are in process of delivery, mostly from the Kingston Works. Also 10 modern passenger locmotives, the heaviest and most up-to-date in Canada. These engines are equal in aggregate capacity to at least 90 of the previously recognized standard. Of the freight locomotives 30 are of the Mikado, 10 of the Sante Fe and 15 of the Standard Consolidated type. In showing the wonderful improvement in locomotive equipment it is said the capacity of one of the Santa Fe class is about 4½ times that of the type of locomotives in service in 1888.

There has also been added to the equipment this year a powerful rotary plow in addition to two already in service, for the purpose of guarding against a snow blockade during the approaching winter.

The Moncton shops have been very fully occupied on necessary repair and renewal work but some new tender tanks and all steel baggage cars have been constructed.

Complete figures of the increased traffic and general betterment in conditions on the Government system will of course be submitted to Parliament. In this connection some increases in the gross ton mileage for this year may be noted:

January	56%
February	33%
March	30%
April	56%
May	59%
June	37%
July	22%
August	14%

These increases are over a steady increase last year.

During the year the diversion of the main line out of Moncton has been completed, giving the Intercolonial trains the benefit of the better grade of the Transcontinental. The traffic of the Transcontinental Division from Moncton to Chaudiere Junction is about equal to that of the Sydney to Truro Division of the Intercolonial.

THE MEADOW BROOK SHROPSHIRES

Mr. Andrew MasPherson, Farm Instructor at the Dorchester Penitntiary, has sold his Meadow Brook Farm, Rocklin, Pictou County, N. S., to Messrs. Scott and Walmsley, two young Englishmen, who will specialize on Fruit and vegetable growing. Mr. MacPherson offers his splendid Shropshire flock for sale in this issue of the Maritime Farmer.

This flock was founded in 1895 by importations from some of the best flocks in Canada.

They were first shown in competition in 1897, at the Provincial Exhibition at Halifax, and won a goodly share of the prizes.

Since then they have been exhibited every year, except two, and always sustained the honors of the breed in the keenest competition.

Typical sires of the highest quality have always been used as flock headers. These siees have been bred by such noted Shropshires breeders as Mansel and Williams of England, and Campbell and Miller of Ontario, until at the present time the flock presents all that the most critical judge could desire in Type, Constitution and Quality.

The Shearling and Ram Lambs that are offered for sale each year give our customers a chance to use pure bred sires at the head of their flock that are second to none in Canada, comprising the densely covered fleece with the desired mutton form, that are so eagerly looked for in well bred Shropshires.

Ram Lambs from this flock brought the highest price at the Government sale of Rams at Hawkesbury, C. B., in 1907, in competition with stock from the best breeders in Ontario.

In 1899 "The American Shropshire Association Prize" for best Ram Lamb and four Ewe Lambs was won by lambs from this flock. Nine years later, 1908, at the Pictou County Exhibition, the Meadow Brook flock winnings were as follows:

First for Aged Ram.
First for Shearling Ram.
First for Aged Ewe.
First and Second for Shearling Ewes.
First and Second for Ewe Lambs.
First for pen of one Ram and four Ewes.

Thus winning every First but one in the class for Shropshires.

"Not how many, but how good" has been Mr. McPherson's motto, and his aim to please his customers in quality and price.

STOP YOUR FIRE LOSS "METALLIC" BUILDINGS ARE SAFE

WHY build with inflammable wood when you can get fireproof, weather-proof and lightning proof "Metallic" building materials. They are far cheaper in the end. "Empire" Corrugated Iron Siding is easily and quickly laid and makes a strong, rigid wall. Its light weight makes heavy construction unnecessary.

"Eastlake" Galvanized Shingles, coupled with "Hamilton" Ventilators and "Acheson" Roof Lights make a perfect roof. "Metallic" building materials defy the elements. "Eastlake" roofs laid over thirty years ago are good today.

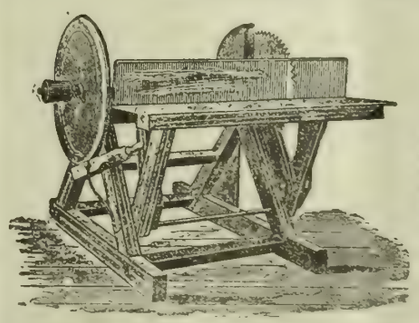
"Metallic built" means fireproof, stormproof, neat and durable construction.

Before buying any building materials write us for Booklet and complete information. We can save you money.

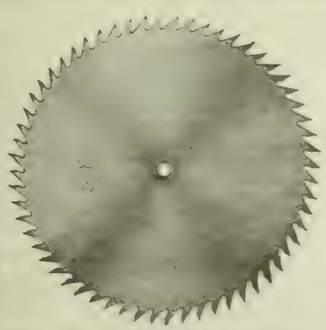
Metallic Roofing Co., Limited
Toronto and Winnipeg

Sussex Wood Cutters Cut Expenses

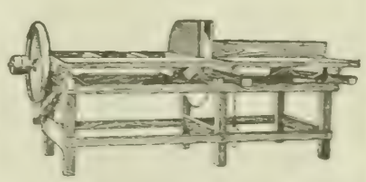
Consult Our Quality Line Before Buying



Short Swing Wood Cutter



Wood Cutter Saws guaranteed at the right price. All sizes. Prompt delivery.



Flat Roller Table.

CONVENIENCE ECONOMY DURABILITY

are the three money-making qualities embodied in our Wood Cutting Machines. No frail parts to give out in a season's use. Built to last a life time. Frame is made of well seasoned birch, bolted and mortised; table of heavy steel plating in one piece.

Swing Table Machines built on skids, bearings supplied with compression greese cups. Especially adapted for use with gasoline engines. Made in four styles—Long Swing, Long Swing Improved, Short Swing, Flat Table.

Ask for our Catalogue and Prices, it will pay you.

Remember we also manufacture Trenholm Gear Hay Presses, Grain Grinders, Root Pulpers, Feed Boilers. etc.

The Sussex Manufacturing Company, Limited, Sussex. N. B.

Annual Convention of the N. S. Dairymen's Ass'n.

Fourth Annual Convention of the Dairymen's Association being the fifth annual gathering of the dairymen, convened at the Agricultural College at Truro, on Wednesday and Thursday, Jan. 3rd and 4th.

The evening session of the Short Course on Wednesday was given over to the Association and a gathering of between two and three hundred people met in the Assembly Hall.

D. W. Murray, the president of the Association, occupied the chair. In the course of his address, Mr. Murray said that by personal observation in his travels, he had come to the conclusion that the best roads were found in dairy districts. In such districts practical methods of road repair were followed. The dairymen were obliged to traverse their roads in all kinds of weather and at every season of the year and were thus able to advise the road makers as to the places in the road needing the most attention.

He advocated the home growing of feed, the elimination of the nondescript cow, and sticking to one breed. He openly declared that there was no place for the dual purpose cow in dairying and considered that it was simply waste of time to bother with her. The creamery managers could do a great deal of useful work in their respective communities by keeping records of the progress that is being made in their patrons respective herds.

W. A. MacKay, Dairy Superintendent, then gave his annual report of the work done during the year. Most of his attention had been directed on the creameries, as cheese factories are not very popular in Nova Scotia.

21 creameries were in operation in Nova Scotia during the season 1916, an increase of one. The registration of cheese factories and creameries has been effected and factories not coming up to certain requirements in equipment and sanitation cannot be registered.

Cream grading has also been introduced and some of the creamery men are doing splendidly under the new system. At least $25,000 have been spent in the improvement of creameries and their equipment during the past year. The Pictou County Creamery Co., Stellarton, have installed a mechanical refrigeration plant, the first in the province. The Government is operating two creameries in Cape Breton, one in Baddeck, the other in Margaree. The Margaree Creamery is meeting with good success.

Mr. MacKay visits the various creameries and encourages cream grading, the use of the Acidometer churning records and moisture tests.

Creamery picnics were held at River Hebert, South River, Bridgewater, Scotsburn, Malignant Cove and Margaree as a means of getting the patrons together in a social way and discussing the problems of their respective creameries.

In concluding his report Mr. MacKay said: Nova Scotia is splendidly adapted for the successful prosecution of the dairy industry. There are no prospects for over doing, so that instead of producing one-half million in the industry, ten million is quite possible. The output of the creameries of Nova Scotia has increased over a thousand percent since 1907.

J. W. Mitchell, the new Live Stock and Dairy Superintendent for New Brunswick was the next speaker.

Mr. Mitchell is not a stranger in the Maritime Provinces as he had charge of dairy work here in 1901-3 of which time he gave some reminescences. He was glad to know that Nova Scotia was so rapidly progressing in the dairy industry. Success is sure to follow the adoption and practice of right principles. Dairying is a manufacturing business and in it, as in every other line of industry, the profits are the difference between cost of production and returns received for the finished product. He recommended the dairymen assembled to produce economically but produce a quality article. Produce quality milk during the major portion of the year. Be fair to the cow. Give her proper conditions. Feed economically by growing more feed of desirable kinds, such as legumes and foods rich in protein. Plan for soiling crops. Weed and build up the herd. Attend to the individual members of the herd in regard to testing and feeding and the average of the herd will take care of itself. He claimed the majority of the herds in the Maritime Provinces could be reduced 50 per cent. in number and still increase the present production. He intimated that in New Brunswick, where societies purchasing pure bred stock are bonused, he will plan to increase the bonus in cases where stock purchased is from record making ancestry.

Mr. Mitchell is a strong advocate of the cream grading system. It is a sound business principle to pay according to quality. Grumbling re the cream grading system does not come from the producers of quality cream. The careless producer is the one who always finds fault.

He recommended the farmers present to make 35% fat their standard cream test—not over 40% and not less than 30%. This makes a cream that is easier cared for and that is not so bulky to handle. As a parting message, Mr. Mitchell advocated the improvement of dairy products quality and the increase of quantity.

Mr. Burgess of the Cold Storage Department, Ottawa, who acted as one of the judges in the butter exhibition said the new butter was good, but he had found the October make not so good as he had found in the same class last year.

The major fault with the newly made butter was its moisture content. One of the October packages was particularly moldy and sufficient care had not been exercised in the selection of boxes or in the quality of the parchment used.

The trophies and prizes in the butter competition were then presented.

The Thursday morning session was devoted to the butter scoring contest and discussions on the various samples of butter at the exhibition as outlined on page 173 of this issue.

Thursday afternoon was the business session. Officers were elected for the current year as follows:

President—D. W. Murray, Scotsburn; Vice-Pres.—A. M. Wheaton, Wolfville; Secy.-Treas.—W. A. MacKay, Truro; Directors—President, Vice-Pres.; C. R. DeLong, New Germany; A. Cameron, Lower South River; H. Falconer, Stellarton; Auditor, C. R. B. Bryan.

The live questions brought before the Convention and discussed were: Cream Grading, Insurance, The Workmen's Compensation Act, Oleomargarine and Next Year's Dairy Exhibition.

The judges on the Dairy Exhibition reported very favorably on the quality of the fresh made butter, but not nearly so well on the October butter, as the score would show. A discussion took place relative to the Creamery Butter Exhibition for Next Year and a motion was brought in favoring that arrangements be made to have a sample package from each creamery sent to cold storage in Halifax each month from May to October, this to be scored in the fall. The Department of Agriculture through the Association are willing to give considerable support in this direction and the idea received very favorable support from nearly all of those present, only one or two of the creamery managers not falling into line. Mr. W. B. Proctor, of the firm of Smith & Proctor, on behalf of his firm, offered that if such a competition was held that they would present to the winner $100.00 in gold. Mr. D. C. McNeil, on behalf of the DeLaval Dairy Supply Co. offered to present $50.00 in gold. If the creameries can be got to support this movement, the competition will be held.

Resolutions were passed as follows:

Resolutions

Resolved that this Nova Scotia Dairymen's Association in Convention assembled extend fraternal greetings to the Maritime Stock Breeders in Convention assembled at this time in Room 1.

Resolved this Association wishes to express its sympathy to the veteran dairyman, Mr. Geo. Vinten, of Antigonish, on account of his continued indisposition during the past year.

* * *

Resolved that the thanks of the Dairymen's Association be tendered to the Judges, Messrs. Harvey Mitchell, Joseph Burgess and C. W. McDougal for the very efficient manner in which they have distributed the butter awards.

* * *

Resolved that the thanks of this Association be extended to Prof. J. W. Mitchell, Live Stock and Dairy Commissioner for New Brunswick, for assistance rendered at this Convention.

* * *

Resolved that this Association tender to the Dept. of Agriculture of Nova Scotia our high appreciation of the efforts of our Dairy Superintendent, W. A. MacKay, in the advancement of the Dairy Industry in this Province.

* * *

Whereas the following have contributed so liberally to the success of the Exhibition which has been held in connection with this Convention, Therefore be it resolved that the thanks of the Nova Scotia Dairymen's Association be forwarded to the Canadian Salt Co., Ltd., The DeLaval Dairy Supply Co., Ltd., The J. B. Ford Co., C. Richardson & Co., also to the butter buyers, viz—Smith & Proctor, R. B. Colwell, Nickerson & Co., Halifax; Smith & Proctor and Harris Abattoir Co., Sydney.

* * *

Whereas the importance of the grading of cream which has been so forcibly presented to us by the several speakers of last evening, also the marked benefit which the creameries who have graded have received from the grading of cream in the past. Therefore, be it resolved that this Nova Scotia Dairymen's Association strongly urge on all creameries the advisability of the grading of cream by all creameries in this Province.

* * *

Whereas an agitation has been brought to bear on the Government of the Dominion of Canada, to permit the importation and manufacture of oleomargarine into Canada as a substitute for butter, and whereas after giving this matter consideration, we believe that this would be detrimental to the dairy interests in Canada and whereas in the countries where oleomargarine is sold, it is not giving any real relief to the consumer, due to the fact that the price of oleomargarine is kept as near as possible to the price of butter and whereas we believe that the sale of oleomargarine would seriously affect the consumption of butter,

Be it resolved that we, the Dairymen's Association of Nova Scotia in Annual Convention here assembled, place ourselves on record as being opposed to the lifting of the restrictions as they at present exist, and that a copy of this resolution be forwarded to the Minister of Trade and Commerce and also to the Minister of Agriculture at Ottawa.

* * *

Whereas there is dissatisfaction in the butter trade regarding the irregular weights of butter in 56 and 28 lb. boxes, due to the irregular size of boxes and whereas the same irregular weights lead to confusion in the competition butter exhibits it is Resolved that this Association in Convention assembled recommend the box manufacturers to supply our creameries with a butter box of more uniform capacity and better quality.

* * *

Whereas there is dissatfsfaction in the butter trade regarding irregular weights of butter in 56 lb. and 28 lb. boxes and

Whereas the same irregularity of weights leads to confusion in the competition butter exhibits, be it

Resolved that this Association in Convention assembled would recommend that in Association exhibitions the creamery solids classes be the standard export weight of 56 lbs. and 28 lbs.

* * *

Resolved that this Association have the By-Laws and Constitution Dairyman's Act and Amendments to Act of the Dairymen's Association printed and the Secretary be authorized to proceed with same at his discretion.

Delegates were present from nearly all of the cheese factories and creameries of the Province and on the whole the Convention was the most successful yet held.

In the evening the members of the Association and friends to the number of about forty were entertained to a banquet by Mr. J. D. McKenzie, manager of the LaHave Creamery Co., and winner of the Butter Buyers' Trophy in the exhibition. A very enjoyable time was spent.

THE HIGH COST OF LIVING FROM A FARMER'S VIEW POINT

Mr. President and Members of the Lunenburg County Farmer's Association, I have been thinking for some time past what I would have to say at this annual meeting. I finally decided on the high cost of living from the farmer's standpoint of view. There has been econsiderable agitation in the newspapers and magazines throughout the country in regard to the high cost of living and many untrue statements have been made with reference to the responsibility of the farmer in regard to the matter. Therefore in order that the consuming public may have some of the facts explained, I will submit the following:

It must be always borne in mind that from the dawn of history the food of the world has been produced by a 10 to 16 hours labour day. In many countries with cheap labour and high priced lands the yield per acre exceeds that of Nova Scotia. The Nova Scotian with cheap lands and high priced labour produces nearly as much per man as does any farmer of any country of the world. The high cost of farm products is due to several causes. Some of the more important ones are:—The climatic condition of this country during the past year was perhaps one of the leading causes of crop shortage, a long cold wet spring followed by very hot dry weather. Extending over Canada and the United States for example the wheat in the

north west was a crop failure. This is particularly true of potatoes. The potato crop of Nova Scotia was 3 million bushels above that of last year. Taking the Canadian crop as a whole it was below the average. The first reason was climatic conditions, the second was shortage of farm labour due to the war, and the third reason was the high price of Blue Stone. Many farmers did not spray in this country, the result was that rot set in. Now as to the markets for Canadian potatoes the United States has lifted the embargo on Canadian potatoes. Cuba is taking large cargoes of our potatoes. The Cuba market is strong paying $6.25 per barrel. A Lincolnshire firm is open to consider quotations. A Staffordshire firm is open to receive quotations on hundred ton lots. A Leicester firm is open to receive quotations on a hundred ton consignment. A North Staffordshire firm is open to buy Canadian potatoes. It must be borne in mind that the high price has struck the farmer in whatever he buys as much as it has the city consumer. Farm labour is scarcer and higher than ever before. Everything the farmer buys whether machinery, fertilizer, fencing, clothing, or the necessaries of life have increased by leaps and bounds. This is also true of taxation. The fact that nearly one half of the civilized world have left the field of production and entered the work of destruction, has increased the demand for all kinds of produce and goods. As to the products of the farm, the fixing of prices is mainly by the law of supply and demand in the markets of the world. At present the prices of some articles, such as milk, is cheap taking into account its food value. The consumer of Bridgewater is paying 7c per quart for milk.

Again the consumer is holding the farmer up for the high price of meat. We are not getting a higher price for our fat oxen than pre war times. Five car loads of beef steers left Bridgewater the last 2 weeks. All the butchers were paying was $13.00 per hundred. Hides have advanced 6 and 7 cents per pound since last year. The farmers do not benefit by the advance. Take the hog, from 1904 to 1914 Canada's export trade with Britan in hog products decreased and Denmark's increased. From 1914 Canada's export bacon trade increased and Denmark's has gone the other way, showing a falling off of 73,000,000 pounds for the fiscal year ending March 31st. For the fiscal year March 31st, 1914, Canada has exported totalled 23,620,861 pounds, for 1916, 144,150,309 pounds. The United States experienced a like increase. On June 30th, 1916, there were less hogs in the country than at any time during the previous ten years, and from 1911 to 1916 of one million. In England and Wales the number of hogs has been reduced by a quarter of a million; during the year ending June last in France the reduction in total numbers amounted to upwards of a million; in Prussia the decrease from December 1913 to the same date last year has decrased 8,371,000.

The dairy situation. A great many of the consuming public is blaming the farmers for the high price of the dairy products, and that the LaHave Creamery is responsible for part of this. No one department of the farming industry has received so much public attention during the past few years as has this particular branch. I am speaking of Nova Scotia. It is true that we had a record harvest of hay, good crops of grain, the best yield of corn on record. The turnip crop was a failure. It is also true that the creameries of Nova Scotia has increased 30 per cent over last year. Part of this is due to the increased development of scientific knowledge turned over to the farmer, through the Agricultural college short courses and other agencies. There are many causes why butter is high. All kinds of feed are high. Canada is exporting butter. In pre war times Canada imported butter. The State of Maine has 10,000 less cows than she had 10 years ago. This applies to all the New England States. Ten per cent of the cows did not conceive during the past year. I know of 15 cows in one Agricultural Society that did not conceive during the past year. Again a great many of the farmers are not feeding their cows as good as if their turnip crop had been good, not destroyed by club root as was the case. Again day by day finds less men on the farm to tend these cows. Finally again why living is high, our city cousins have got the habit of ordering supplies by telephone. This has brought into being a minute delivery system, that essentially adds largely to the ultimate cost of food products. The consumer is ready and willing to pay a fair price if he knows the facts, and the farmers will be willing to discuss these matters which are so vital to both producer and consumer alike.

Address by Wallace Rhodenizer before the Lunenburg County Farmer's Association.

TO INVESTORS

THOSE WHO, FROM TIME TO TIME, HAVE FUNDS REQUIRING INVESTMENT MAY PURCHASE AT PAR

DOMINION OF CANADA DEBENTURE STOCK

IN SUMS OF **$500** OR ANY MULTIPLE THEREOF.

Principal repayable 1st October, 1919.

Interest payable half-yearly, 1st April and 1st October by cheque (free of exchange at any chartered Bank in Canada) at the rate of five per cent per annum from the date of purchase.

Holders of this stock will have the privilege of surrendering at par and accrued interest, as the equivalent of cash, in payment of any allotment made under any future war loan issue in Canada other than an issue of Treasury Bills or other like short date security.

Proceeds of this stock are for war purposes only.

A commission of one-quarter of one per cent will be allowed to recognized bond and stock brokers on allotments made in respect of applications for this stock which bear their stamp.

For application forms apply to the Deputy Minister of Finance, Ottawa.

DEPARTMENT OF FINANCE, OTTAWA,
OCTOBER 7th, 1916.

MARKETING POTATOES

(Experimental Farms Note)

From the consumers' side, the question of marketing potatoes is of the greatest importance, especially so in years when the prices for this commodity are advancing daily. The officers of the Experimental Farms recently had an opportunity of inspecting quantities of potatoes in the consumers' own cellars. The potatoes had been purchased in the ordinary way from small dealers. The condition of the potatoes was most unsatisfactory. In three cases the amount of rot came up to 75% of the total quantity in storage. This rot was the common Late Blight rot, and was certainly present when the potatoes were dug, and before shipping.

The consumer is hepless in such cases, and rarely is there a way open to him for compensation. Nor is the small dealer to blame. The blame rests entirely with the shipper and the grower. In order that such losses may be avoided and the consumer be in a position to secure for his good money, good potatoes that will keep over winter, it is necessary for the growers, on their part, to exercise more care in digging, sorting and handling potatoes. Late Blight is a preventable disease; every farmer should know this fact, since the Experimental Farms system has made every effort to demonstrate on many farms in the country the effect of spraying, with results showing the production of sound crops, and an increase in yield amounting to some 90 to 100 bushels per acre.

The sale of inferior potatoes is dishonest, if not illegal at the present moment. Farmers know from their own experience that storage rots cause great losses in their own cellars. It seems, however, the general practice to dispose of an infected crop immediately and shift the losses from rot from the farmer to the consumer. The latter, however, has to pay the price of good potatoes.

In some instances, no doubt, the consumer is to blame by storing potatoes (or other winter vegetables) in too warm cellars. Potatoes and similar vegetables must be stored in a cool place. They cannot stand frost, which causes a sweetish taste in potatoes; but the temperature should never rise over 40°F. Where such conditions are non-existent it s better not to lay in a winter's supply, as losses are sure to result.

Farmers are cautioned that the attitude of consumers will eventually result in demanding grading of potatoes just like apples; and the farmer who does not control diseases in the field, will have all rotten or diseased potatoes thrown on his hands. Diseases potatoes, when boiled, still make good stock food, it should be remembered. A letter or postal card addressed to the Publications Branch of the Department of Agriculture will bring by return mail all the required information relating to the growing of crops of potatoes free from disease.

LARVAECIDE SOLD NOT GIVEN FOR TRIAL PURPOSES

In our report of Mr. Reid's talk on Larvaecide before the New Brunswick Agricultural Societies' United, we said "Last season a small quantity of Larvaecide was manufactured by hand and "given to farmers" in various parts of New Brunswick and Nova Scotia for trial purposes." Mr. Keith, salesmanager of the Larvaecide Manufacturing Company writes that this paragraph should have read "sold to farmers at the same price as we are asking this year" instead of "given to farmers".

In the report of Ayrshire cows and heifers that have qualified in the Record of Performance test from October 9th to December 9th, 1916, we find that Rosie—25936, owned by Campbell Bros., Stewiacke, N. S., heads the Mature Class with 11,620 lbs. milk testing 3.23 per cent butter fat and yielding a total of 375 lbs. fat in 363 days.

Milkmaid of Orkney—39834, owned by Harmon MacPherson led the four year-old class with 14872 lbs. milk, testing 4.00 butter fat, and yielding a total of 596 lbs. fat in 365 days.

The three-year-old class was led by Queen Jessie of Brookside—41406, owned by John McKee, Norwich, Ont., milk testing 4.41% fat. Total fat 448 lbs. in 328 days.

Maud of Fernbrook 3rd—46182, owned by Collier Bros., Beachville, Ont., led the two-year-old class with 8,982 lbs. milk testing 4% butter fat and yielding a total of 360 lbs. fat in 365 days.

The many friends of Rev. Father D. J. MacPherson, formerly parish priest at Glendale, Cape Breton, will be pleased to know that he has been appointed chaplain to No. 9 Stationary Hospital (St. F. X. Unit). Father MacPherson has just been transferred from Saloniki where he had been stationed for several months.

Father MacPherson graduated from St. F. X. in 1898.

Advertise in the Farmer

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

TEN Shorthorn Bulls for sale. — WALTER EATON, Upper Canard, N. S.

FOR SALE—Registered two-year-old Clydesdale Stallion, price moderate. — LENNOX NAPIER, Lower Woodstock, N. B.

FOR SALE—Hampshire Sheep, both sexes also some males and females of any of the popular breeds. All good stock.—CEPHAS NUNN, Winsloe, P. E. I.

WOULD YOU MARRY IF SUITED? Best matrimonial paper published. Mailed FREE.—THE CORRESPONDENT, Toledo, Ohio.

FOR SALE—Ayrshire Bulls and Heifers, from one week to two years. Registered Clydesdale Stallions and Mares John A. Hughes, Petitcodiac, N. B.

FOR SALE.—"Oakfield Fern Prince," registered Holstein Bull, aged 22 months. Price $85.00. Sire, Homestead Prince Dorinda; dam, Cobequid Holbron Fern Ada. Apply FOREMAN, Oakfield, Halifax Co.

LADIES to do plain and light sewing at home, whole or spare time; good pay; work sent any distance, charges prepaid. Send stamp for particulars to NATIONAL MFG. COMPANY, Montreal.

FARMERS DON'T MISS THIS—I have a few of the wonderful Aladdin Coal Oil Lamps left which I am offering at very low prices. Write for full particulars. Address E. H. SMITH, Nauwigewauk, N B.

TROTTER FOR SALE—Handsome Black Gelding, young and kind; not afraid of anything; a fast trotter with lots of action. Safe for a lady to drive. An extra good ice hors . Would exchange for a heavy express horse.—A. M. WILSON, Erskine St., Dartmouth, N. S.

WANTED.—Working foreman for 100 acre farm, Annapolis Valley, 30 acres of which is bearing orchard. Must be competent to take full charge and relieve owner as he has other business. Married man preferred. Apply to MARITIME FARMER.

FOR SALE.—One of the best Clydesdale Mares in Eastern Canada; imported. Won first prize at P. E. I. Exhibition, 1913, also first at Cape Breton Island Exhibition, 1915 and 1916. Price $300. Weighs 1660 lbs. Also pure bred Foal of same, foaled April 23rd, 1916, also first in class at exhibitions. The Department of Live Stock Records, Ottawa, are at present attenders to registration of this animal. Price $130 —ROD. McLEOD, Glen Farm, Groves Point, Cape Breton.

J. H. Grisdale, Director of Dominion Experimental farms sends the following message to the farmers of Canada through the columns of the Christmas number of The Nor'west Farmer. Successful crop production depends on:

Securing and properly cleaning a plentiful supply of the right kind of seed, as an early maturing, good quality of wheat, a heavy yielding, strong strawed oats, and an up-standing heavy yielding barley, etc.

Having every implement and every horse or other source of motive fit and ready for the first favorable day for seeding.

If humanely possible, loose not an hour in seed time.

Do all spring work well. While in good years this may not always seem profitable, in poor seasons it is sure to pay, and it is for poor seasons we must always prepare.

Do the summer cultural work well. It will show up next year. Be ready for the harvest rush. Power and machinery fit and ready days ahead.

Thresh or stack without delay.

Keep moving toward mixed farming. This is only indirectly imperative, but, while its neglect might not seriously affect immediate results, it will, very certainly influence crop production at an early date on even the most fertile grain farms.

Keeping the fall-farrowed pig comfortable is half the battle of making it a profitable animal on the farm.

FOR SALE!

R. O. P. HOLSTEINS!

Two Bulls fit for service, sired by the "Champion" Holstein Bull of the Maritime Provinces. Dam of one gave over 11,000 milk and 500 butter in a year at 2 years old and the other is full brother to a 4-year-old show cow that made 468 lbs. milk and 20 lbs. butter in a week in R. O. M. and is now finishing a R. O. P. yearly record of over 16,000 milk and 700 butter at 4 years old. For full information and price write

Volume 22. SUSSEX, NEW BRUNSWICK, JANUARY 23, 1917. Number 8.

The N. S. Fruit Growers' Convention

The fifty-third Annual Meeting of the Nova Scotia Fruit Growers' Association was held on January 16th, 17th and 18th in the Agricultural Demonstration Building, Laurencetown.

The executive of the Association had been criticised adversely for settling on Lawrencetown as the place of meeting, owing to limited hotel accommodation. Knowing the public spirited citizens of Lawrencetown to be equal to the occasion, the members of the executive, like Brer Rabbit, "said nothing and lay low."

Dr. J. B. Hall was one of the committee who had the housing of the members in charge and that was assurance enough that everything would be done in his usual methodical style. Many of us who were former pupils of Dr. Hall at the Normal school, were pleased to meet him again and find him as active and energetic as in our school days. Dr. Hall takes a great deal of interest in the extension of Agricultural Education to the rural schools of the province and is a tower of strength in promoting the various organizations that make the Lawrencetown Agricultural Demonstration Building their headquarters.

On arriving in the pretty little town the members of the Association found ample accommodation for everybody. When the hotel was comfortably filled the overflow was cosily lodged in the spare bedrooms of the best families of the town. The former adverse criticism was soon changed to well deserved praise and the convention settled down to business at 2.30 o'clock on Tuesday afternoon.

As to the building in which the meetings were held, more appropriate quarters could not de desired. The assembly room of the Demonstration Building is commodious, clean, well lighted, well heated and comfortably seated the convention. Every seat in the hall was filled. Good order prevailed and excellent attention was paid to the respective speakers, which was clearly demonstrated by the intelligent discussions that followed the various addresses.

After the invocation of the divine blessing on the deliberations of the meetings by Rev. S. J. Boyce, the President of the Association, F. A. Chipman read the following address:

The President's Address

MEMBERS OF THE FRUIT GROWERS' ASSOCIATION—Ladies and Gentlemen;

It becomes my pleasure, as well as my duty, at this our fifty-third Annual Convention to deliver to you the opening address.

The year 1916 stands unique in the apple growing history of Nova Scotia. To the up to date grower and the optimist the large rewards have gone; to the careless grower and the pessimist, the failures. In the spring of 1916 the Valley was divided into two camps, the one saying, "It is no use to spray this year, apples will be worthless next winter," the other saying, "We cannot afford to neglect our orchards even if we do get nothing for our crops of this year." The result you all know. The growers who stood by their orchards are for the most part marketing good crops and in many cases record crops of fruit, at better prices than they have received for years.

The crop in the British Isles was very short. In the United States the crop was somewhat short and was, and is now, kept from competing to any extent with our crops on the British market on account of lack of transportation facilities at any price. Thanks to our authorities and to the much appreciated and successful efforts of Mr. J. E. Furness, Canadian Manager of the Furness Withy Company, we have been allowed as much space as we could expect in such times as these and are receiving unusually high prices considering conditions.

In explaining the shortage of the 1916 crop in Nova Scotia the assertion is made by many of our best growers and authorities on the subject that the quantity of apples produced depends on the spraying of the previous year rather than on any treatment of the current year, the effect of the spraying being to keep the leaves healthy and to keep them on the trees until late in the fall, so forming strong fruit buds. The year 1915 was unusually bad for fungus growth and the leaves in unsprayed orchards dropped very early preventing the formation of fruit buds in such orchards. This explains the very uneven crop of 1916, with the orchards of Col. Shippy Spurr, of Melvern Square, giving a record crop and containing so few No. 3's that none were packed, of John Buchannan, of Berwick bearing a record crop of the highest quality of fruit and Mr. A. K. and Ray Clarke, of Lakeville, with bumper crops and no orchards within miles of those named approaching them in quantity or quality. Just now let me say that black-spot or apple scab never was so prevalent in Ontario as in 1916. Many of the Ontario orchards were almost defoliated in August and September, owing to the scab infecting the leaves. I leave it to you, gentlemen, to guess the effect of that on the Ontario crop of 1917 and to judge the extent to which Ontario apples will compete with our apples in 1917-18.

It is futile for me to remark on the war. Needless to say that it must and will be carried to a successful and we hope speedy termination. The fruit farmers of Nova Scotia have sent their quota of men and more, one or two localities in the Annapolis Valley having probably as high a percentage of men enlisted to fight for the Empire, as any in Canada.

As fruit growers studying the economical growing and marketing of our product, we are in very much the same position as last year and we may, I think, with profit, ask ourselves the same question as the successful optimist of last season asked himself, "Can we afford to neglect our orchards even if we do get nothing for our crop of this year." And who knows what we will get for this year's crop.

Prices up to date have been phenomenally high and the members of the Co-operative Fruit Companies and those growers who had the courage to ship, have received better prices than for many years past. Unfortunately many of our growers sold out early in the season to speculators at prices ranging from one dollar to one fifty per barrel for No. 1, 2 and 3 in standard varieties. Some 80 per cent. of the apples outside the fruit Companies were bought for these prices and many of the company members unwisely sold without consulting the management, getting in many cases a ridiculously small price and at the same time injuring their fellow members by setting a low price on apples as well as increasing the expenses of the company by forcing the other members of the company to carry overhead charges and dead warehouse space on apples sold to speculators.

This year is giving the co-operative movement in the Annapolis Valley the greatest boost in the history of the organization. There is no doubt that without the cooperative companies 90 per cent. of the fruit would have been in the hands of the speculators at the price previously indicated. Whether we are members of the Companies or whether we take the benefits of the Company by forcing the speculator to give us higher prices, we must acknowledge that this year the Fruit Companies have saved their members thousands of dollars while those outside the Companies who sold for small prices remind us of the treatment we should all receive if it were not for our justly famous Co-operative organization.

The best of us cannot even guess at the present time the prospects for 1917 apple crop. In my opinion we should at least not neglect our orchards. We should not only "Hope for the best and prepare for the worst," but we should "Work for the best and prepare for the worst." In working for the best let us grow as good a crop of apples as possible, as cheaply as possible and make plans to market them to best advantage next year. In preparing for the worst let us ask ourselves how we can carry on our house and farm most economically during the coming year. I believe that we could profitably spend an afternoon discussing among ourselves economies about the farm. We might ask ourselves a number of questions about economy.

Are we growing as much grain and rough feed for our teams as we should? Could we decrease the amount of Ontario mill feed that we are forced to buy by growing and feeding more roots?

Are we growing all of the vegetables, such am pumpkins, squash, beets, carrots, potatoes, turnips, cabbage, etc., that our families should consume?

Are we having as many vegetables, meats and fruits canned and preserved in seasons of plenty for the off seasons, as we should?

Is it not more profitable, as well as better for us to eat our eggs, chickens etc., grown on the farm than to sell them to dealers and buy beefsteak with the money?

Would it not be more economical to buy our fish, sugar, oil and such commodities by the hundred weight or barrel, instead of by the pound?

Are we situated that we can grow with profit a couple of acres of wheat for our next year's flour?

Are we growing and curing as large a proportion of the ham, bacon, pork, beef, mutton and poultry consumed in our homes as we should?

Have we ever considered the fact that sheep raising could be worked easily and well with an orchard. That in this province we grow the best flavored mutton in America as well as the best textured wool and best of all we can raise sheep to perfection on home grown hay and turnips and without that more expensive Ontario mill feed. Have we considered that the real reason that we do not raise sheep is on account of the cur dogs that some of us keep and pet and which, in war time as in peace time, consume enough food for a flock of hens or a pig.

If we are to grow beef on Ontario mill feed would it not be cheaper to grow that beef in Ontario and save the freight on the difference in weight between the beef and the feed or else take steps to grow our meat in the form of mutton on home grown feed.

I raise these questions, gentlemen, and hope that you will consider them both here and when you go to your homes. I believe that we are neglecting many opportunities as fruit growers, to provide our families and farms with better and cheaper food.

Again, gentlemen, let me remind you that during 1916, in spite of many fears that we had to the contrary, the rewards have gone to the men who worked and cared for their orchards.

I thank you for the honor of being chosen as your president and I hope that you will assist by questioning closely the speakers who are with us and by full discussions make these meetings both profitable to ourselves and to the community as a whole.

H. S. Shaw, S. B. Chute, W. H. Woodworth, W. S. Blair, S. C. Parker, F. W. Foster and others took part in the discussions on the various points

emphasized in the president's address. Several of the speakers expressed their view in no uncertain terms in regard to their utmost belief in the system of specializing on fruit-growing. Others favored the introduction of mixed farming in conjunction with fruit-farming, while some justified the latter from the patriotic standpoint.

Fruit Inspection and Inspectors

Mr. Geo. H. Vroom, Fruit Inspector for District No. 1 read a paper on the Fruit Inspection System, in which he reviewed the origin of the work, the various changes that have transpired and the evils that have been corrected from its inception up to the present time.

Mr. Wyatt asked if it is possible to pack apples in barrels for shipment to England with any degree of assurance that they will arrive at their destination in good condition?

Mr. John N. Chute, who has spent considerable time in England in connection with the fruit industry of Nova Scotia replied: They can, but every man can not do it. Packing apples properly is a trade in itself and given good fruit and proper package, other conditions being normal, when work is properly done no difficulty will be experienced.

Messrs. S. B. Chute, W. H. Woodworth, Leslie Wiltshire and M. K. Ells, referred to the poor grade of apples that is being handled by the vendors on the various passenger trains and on the tables of some of the hotels in the very midst of the best fruit growing sections of the province, and the necessity for an attempt at reform along this line.

Lessons Learned in English Markets

Was the subject of an address by Mr. J. N. Chute. The speaker outlined the sales methods as they exist. The two methods of sales are Auction Sale and Private Sale. The London market follows the Private Sale system, while many of the other large markets follow the Auction Sale plan. The latter is the most expeditious way in which the open market may be cleared of fruit. There are three sales organizations:—Brokers, Importers and Buyers.

These organizations follow three rules that require the attention of our fruit growers and packers. The first rule concerns the classification of apples re grades, types, slacks, etc.

The second rule concerns the minimum rate of expense of sales which are at time exhorbitant.

The third rule concerns the monopoly the members of the Buyers Association exercise on the right to seats in the sales room.

Mr. Chute said the only way to get redress in regard to the foregoing rules was through proper organization among the growers. He also offered the following suggestions:—Don't ship slack barrels. Fill barrels and do not head until only a short time before date of shipping. Do not bruise when heading. Pay strict attention to the colouring of the fruit. Look after the continental trade as well as that of Britain. Fruit intended for the continental markets must be well colored. Nova Scotia apples are gaining in favor and are more appreciated than American box apples. Grow fruit as perfectly as possible. You can sell poor apples, but you can sell many more if the quality is good. Advertising availeth not unless it is backed by the goods.

Results from Dusting Instead of Spraying in the Annapolis Valley

Was the subject matter of a paper read by Mr. Paul A. Murphy, of Charlottetown. The dusting method was tried in two orchards in the valley last year, for the purpose of contrasting results with that from spraying. The results were quite in accordance with the successful five years series of experiments conducted by Cornell University experimenters.

The lightness of the machine. The feasibility of operation immediately after a heavy rain storm and between showers, and the extensive area that may be covered in a comparatively short time, thus enabling the work to be done at just the proper time, were points argued in favor of the dusting process.

A dusting machine was shown in operation in the pavillion and the points emphasized appealed to some of the larger growers. Others who have tried and proved the spraying system were not so enthusiastic and expressed themselves as inclined to follow the old adage "the devil you know is better than the devil you don't know." Experiments will be continued with the duster during the following seasons and until more definite data, covering a number of seasons is obtainable, Mr. Murphy's advise was "Go slow." There will be extensive tests next season, as we understand several machines were purchased from the dusting machine's representatives who were at the meeting for demonstration purposes.

The Tuesday Evening Session

Was held in the pavillion section of the Demonstration Building, where there was ample room and comfort for the citizens of the town who wished to join with the Fruit Growers' in their deliberations. Not only did the citizens of Lawrencetown enjoy the various discussions, but their committee had a pleasing programme of instrumental and vocal music and reading numbers rendered between the addresses, which was much enjoyed by everybody and which showed a good sample of Lawrencetown talent.

The address of welcome was presented by Dr. Hall, who spoke with optimism and with a vision of what the future holds in store for a sane and sound system of Agricultural Instruction in the province. Dr. Hall is and has been a keen student of events and gave an interesting account of the growth of the fruit growing industry in the Valley. He optimistically referred to the opportunities that lie as yet only partially developed between the waters of Annapolis and Mines on the eastern and western extremities and the North and South Mountains on the other sides—a possibility for the growth of over 30,000,000 barrels of apples.

Prof. W. S. Blair, who replied to the address of welcome propounded the question "Are we doing what we can? Are we living to and practising according to the best of our knowledge." In conclusion he said: "Let us take stock of ourselves and our operations. Let us not stand still, and let each and every fruit grower in the Valley take an interest in the Association that means so much for the advance of their chosen industry."

The addresses of the evening were a paper on Injurious Insect Pests by Mr. A. G. Dustan, of Annapoiis. A talk by Prof. Britain on The Green Apple Bug. Extracts from these addresses will be published in future issues of The Maritime Farmer.

Miss Fletcher, the official stenographer of the Association, in behalf of the Returned Soldiers Comforts Association made one of the most clever appeals ever listened to by the Association, for donations of apples for the invalided soldiers, whose first request after landing in Halifax is almost invariably for an apple. The response was most generous. Prof. M. Cunning agreed to act as secretary of the fund and Mr. Graham, manager of the D. A. R. kindly offered to transport free of charge, all fruit donated for this purpose.

Mr. Graham also read a paper calling attention to the opportunities for national service by increased production and to the extensive markets that calls for and awaits the products of the Annapolis Valley farms.

At the conclusion of the Tuesday evening session, the Lawrencetown Board of Trade entertained the visiting fruit growers at a smoker, at which Patriotism and Production was the chief topic under discussion. Several members referred to their clover seed growing successes during the past year and to the good work done for them by the Government Clover huller.

The Business Session

Was held on Wednesday morning. The Secretary and Treasurer's Reports were submitted and certified correct by the auditors, J. Elliot Smith and W. M. Black. The report shows a balance of $182.12 on January 1, 1916 and receipts during the year of $806.50. The amount disbursed during the year was $637.20 and the balance on January 1, 1917 was $351.42.

The election of officers resulted as follows:

President—Prof. W. S. Blair, Kentville; Vice-President—F. S. Johnson, Bridgetown; Secretary—M. K. Ells, Port Williams; Asst. Secretary—F. W. Foster, Kingston; Treasurer—G. W. Munro, Wolfville; Auditors—J. Elliot Smith and W. M. Black.

Executive Committee—S. C. Parker, W. H. Woodworth, J. E. Schaffner, A. S. Banks.

The Advertising Committee of last year remains unchanged, and is to report at the next annual meeting.

Delegates to the Nova Scotia Farmers' Association—R. F. Newcomb, Port Williams and W. H. Woodworth, Berwick.

A letter from W. A. MacKay, Dairy Superintendent, was read, introducing a resolution asking for the prohibition of manufacture and sale in Canada of oleomargarine and butterine. The resolution was carried unanimously.

Mr. D. Johnson, the Chief of the Fruit Division, had come to Lawrencetown to be present at the various meetings and encourage the industry in which he is so much interested. On his arrival in Lawrencetown he was informed by wire that his brother had died and much to the regret of all concerned he had to return home by the next train. A resolution of sympathy was tendered to Mr. Johnson.

Prof. Blair introduced a resolution that the Association meet at one central point, preferably Kentville, each year for their Annual Convention, and make such a place the permanent home of the Association. Also that a fruit show be held in conjunction with the convention and that both convention and show be held late in November or early in December of each year.

This resolution envoked a lengthy discussion pro and con. The pangs of hunger had seized many of the fruit growers before the discussion was ended and when the motion was put to the meeting and carried, the number of members in the hall was very small.

Wednesday Afternoon

The resolution re the adoption of a permanent home for the Association was reconsidered at the afternoon session on Wednesday when both the hall was filled and the members stomachs were no longer craving for food. There was a lively discussion for a short time and on again voting on the question, the resolution was lost.

The committee appointed to prepare a recommendation re No. 3 apples brought in the suggestion that whereas there is no definition for No. 3 apples and whereas all kinds of trash are now being sold as No. 3's by unscrupulous packers, therefore resolved that No. 3 apples be defined so that culls may be excluded.

Off Crops and Their Causes

Was the subject of an excellent paper by Prof. W. T. Macoun, Ottawa, which was followed by a discussion on Factors Limiting Production of Apples in the Annapolis Valley, led by Geo. E. Sanders, F. H. Johnson, S. B. Chute, A. S. Banks, J. S. Margeson, W. H. Woodworth and others.

The substance matter of this address will be published in a future issue of the Maritime Farmer.

On Wednesday Evening

Prof. W. S. Bair gave a report of Work in Dominion Experimental Orchards in 1916, a synopsis of the findings of which is as follows:—

1. The dormant Lime Sulphur spray for scab control is of little value.

2. A stronger Lime Sulphur than 1 to 37 or 1.008 for the first spray for scab control is of no advantage.

3. Four regular Lime Sulphur Arsenate sprays, the first of which is applied when the buds have burst and the leaves partly open, the second, when the bossom clusters have separated and before the petals have opened, the third when 90% of the petals have fallen and the fourth, about ten days after the third spray are necessary for the control of apple scab.

4. If through lack of help and the rush of other work, the fruit grower decides to omit one of these two sprays before bloom, it is advisable to apply one thorough application midway between the time for the first and second sprays.

5. That Lime Sulphur and soluble sulphur are approximately of equal value for the control of apple scab, eleven tests with Lime Sulphur, 4 regular sprays with an Arsenate added, gave .78 as an average per cent of scab while eight tests of soluble sulphur with an Arsenate added gave 1.2% scab.

6. A greater strength than 1½ pounds soluble sulphur per 100 gallons is not necessary to control scab, whereas an increase in either the soluble sulphur or Arsenate may give greater injury to the foliage.

7. Lime Sulphur and Bordeaux mixture are equally effective in controlling scab but owing to the russeting of the fruit and burning of the foliage by Bordeaux, Lime Sulphur is the safe spray.

8. There is no advantage gained in using either the calyx or drive nozzle for scale control. The regular nozzles are the most economical and give equal results, beside the spray is more evenly distributed and less foliage injury resulted.

9. The kind of nozzle is not a factor in foliage injury as long as the amount of spray mixture remains constant.

10. The drench spray for plant bug requires approximately double the amount of spray required for the regular spray.

11. Arsenate of Lime when added to soluble sulphur does not prevent the yellowing nor the burning of the foliage.

12. Arsenate of Lime used with Lime Sulphur does not cause yellowing of the foliage nor increase the foliage injury over Arsenate of Lead.

"Experiments With Insecticides and Their Effects on Some of the Solutions Used as Carriers."

Was the subject matter of one of the most interesting papers read at the Convention. This paper will be published in full in our issue of February 6th. You will do your neighbor a good turn if you tell him about it and advise him to subscribe for the Maritime Farmer right away. This paper alone is worth the subscription price.

At the close of the Wednesday evening session the members of the Association were entertained at a moving picture show by the Board of Trade.

Thursday Morning

The closing session of the Convention consisted of two excellent papers and discussions.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1inch—First insertion 75 cents 2 inches—First insertion $1.50; 3inches—First insertion $2.25.

THE VITAL POSITION OCCUPIED BY PRODUCTION

Nothing in recent years has so emphasized and impressed the real importance of agriculture and agricultural institutions as the war in Europe. It has demonstrated dependence upon this art and has raised it to a preeminent position in the welfare of the country. Ordinarily accepted without much thought or realization by the great body of people, it has suddenly sprung into an importance second only to that of the military activities. It has become, indeed, a recognized field of war service and one of the chief elements in the national defense. Its response, and the resourcefulness and practical value which its institutions have shown, have brought the present position of agriculture close home to the people as never before on so broad a scale.

The problem of maintaining, and in some cases increasing, the production of food for man and beast has been one of the large and difficult ones in the countries at war. It has taxed their skill and organization, and their ability to cooperate in the common good. With thousands of acres devastated, relations with other countries interrupted, and with a vast army of the farmers and laborers on whom production ordinarily rests suddenly become dependent on the labor of others, the necessity of cultivating all available land and making the soil yield its full return became a national concern in all the countries. It inspired unusual measures for stimulating and assisting those who were left on the land, and led to appeals for agricultural workers second only to those for men to fight.

The way in which this extraordinary demand has been met has furnished a new realization of the great advances in every branch of farming. It has entitled agriculture to a regard and consideration which it has not always enjoyed before. If it has not actually raised it to a new position in the lives of nations, intelligent understanding of its position has been greatly broadened.

And along with the rest, this supreme test has furnished an impressive illustration of the great share which agricultural investigation, education, and various forms of instruction have had in placing agriculture on a higher plane of efficiency and in making it more resourceful and adequate. The response of agriculture is in no small measure a reflection of the steady work of various classes of agricultural institutions and organizations, which has been going on quietly and often with meager support or understanding. The measure of strength of these agencies, and the extent to which there has been some form of agricultural organizations to assist, has been a large factor in meeting the unusual situation.

The first efforts in the various countries centered largely on providing the machinery for gathering in and saving the crops, and in this the assistance of the military was furnished to a limited degree. But as time went on the necessity became apparent of providing for the continuance of agriculture on the highest possible plane, of keeping up the fertility of the land, of preventing the depletion of live stock, of avoiding waste of all kinds, and often of discovering and utilizing new sources of supplies. Organized effort was therefore enlarged and increasing latitude extended in the temporary use of soldiers.

The attitude of cooperation between the military and civil authorities is well illustrated by the instructions of the French Minister of Agriculture in transferring to district commanders the assignment of soldiers to agricultural duties. He said: "The regular, prompt, and (as far as possible) complete execution of agricultural work constitutes one of the essential elements of national resistance and consequently one of the principal forces of success. The full use of the soil must be obtained at all costs, equally with the supply of men and material to the army, or the supply of labor to factories engaged in national defense." Soldiers were classified on the basis of farm experience, and opportunity given them to offer themselves for temporary work in the fields. In order to avoid unfavorable reflection upon such, the idea was widely disseminated that soldiers thus volunteering to assist in farm work were not to be regarded as "shirkers" but on the contrary as men doing a double patriotic duty, by fighting and by keeping their brother fighters alive.

In Great Britain the measures and appeals of the government have shown no less appreciation of the importance of agricultural work. Steps were early taken to organize the agricultural forces and to increase the food production. The situation called attention to certain conditions in that country which attempts were made to remedy by a readjustment of the systems of farming, and by organizing systematic means for providing labor and increasing the food returns from the land under cultivation. In directing public attention to the need of special efforts, the president of the Board of Agriculture expressed the conviction that "if agriculture had made no more progress in Germany than it has in the United Kingdom during the period 1895-1915, the German Empire would have been at the end of its food resources long before the second year of the war;" and he explained further that the war was being fought by that country quite as much on an agricultural as on a military organization of the nation.

In an appeal to farmers for an increase in the food production of England Lord Selborne said "You have something more on your shoulders than your own business to-day. You are no longer individual farmers making your own fortunes or losing them. You are trustees on your own land to do your best for England. You have your duty quite as clear and as definite as the captain of a cruiser or the colonel of a battalion. England has a claim on you farmers, men and women of every class, as clear as she has on our sons and husbands to go and serve in the trenches."

The force of the situation in Great Britain is illustrated by the fact that of the total area of cultivated land, two-thirds is in permanent grass and only one-third in cultivated crops, whereas in Germany the proportion is exactly reversed; and, furthermore, by the fact that even in 1915, when the wheat crop was the largest for many years, three-fourths of the wheat supply of Great Britain had to be imported. In 1915 the United Kingdom imported agricultural products valued at £276,803,000, whereas in the year before the war France spent only £60,000,000 for imported food

Similarly, in Germany the need for the greatest possible production of food has been impressed upon the people. The thorough cultivation has been urged of every available piece of land on farms and in towns, and societies have been formed to take the work in hand. Efforts have been made, for example, by the Moor Culture Union to increase vegetable growing on moor land the society announcing allowance to disabled soldiers settling on such lands.

The measures adopted by the various nations are of much interest. The French Government early applied organization to the resumption of farming in affected areas and its continuance on an efficient basis elsewhere. To save the crops the small holdings were "pooled," the inhabitants of the villages who remained being grouped together for that purpose and the assistance of the military given when circumstances allowed. The government also took measures to prevent the wholesale slaughter of live stock, first suppressing the customs duty on practically all food stuffs including frozen meat, and then excluding from requisition for army purposes cows in milk or in calf, brood mares, premium sires, pedigreed stock, heifers, and plow oxen. Similar measures were taken in Great Britain and Germany. In the districts of France that had been invaded, the peasants were in need of horses, implements, seeds, fertilizers, forage, etc. To provide these the government made advances to the peasants, and to prevent the credit banks from breaking down from demands upon them it loaned money to the Caisses Regionales de Credit Agricole, which in turn advanced money to the cooperative societies. Steps were taken to increase the amount of gardening carried on, by putting the opportunity for cultivating gardens within reach of even the humblest. The services of schoolmasters were enlisted to instruct children in gardening and to carry on model gardens.

To direct these efforts a "committee of agricultural action" was formed in each commune. These committees have formed a part of the government's plan for mobilizing agricultural labor, and have also become responsible for the cultivation of farms or holdings which have fallen out of use, the supply of seeds, fertilizers, etc.

In Germany systematic provision has been made for the cultivation of the land—selecting the crops most needed, for providing fertilizers and feeds, and economy in the utilization of agri-

cultural products. In addition to its previous agencies and its food bureau, an imperial office for vegetables and fruit, to further the production, sale, and preservation of fruit and vegetables, was established the past year, with power to provide for the growth of the necessary amount of these supplies and their preservation.

In Great Britain the organization for agriculture has been greatly extended and strengthened. War agricultural committees and borough war food societies have been organized extensively for the assistance of farmers and to secure further allotments of land for cultivation. Attention has been turned to the utilization of land not ordinarily employed in agriculture, such as private parks, golf links, pleasure grounds, etc., as well as bringing more land into cultivated crops. employment of waste woodland for raising pigs, etc.

The farmers have been urged to plow up the poorer of the permanent pastures, shorten the period of grass and clover in rotations, bring the remaining grass into the highest stage of production to enable it to carry more stock, reduce the acreage of bare fallow, and to cultivate more extensively crops for food and for animals.

The labor problem has been a difficult one in all the countries. In Great Britain persons employed in certain agricultural occupations have been exempted from military duty, but despite this, it is estimated that up to the middle of 1916, 320,000 men had been taken from the land. Special efforts have been made to secure labor at critical times, as during harvest, by a national volunteer movement, and women have been drawn into agricultural occupations as never before. In this they have shown adaptability and brought much favorable commendation on their services. Nearly every issue of the Journal of the Board of Agriculture gives accounts of the successful and satisfactory employment of volunteer women laborers, frequently drawn from classes not accustomed to outdoor work. Women's committees have been active in securing recruits, and to overcome prejudice in some sections and convince farmers of the fitness for farm work, agricultural demonstrations have been held by women in doing various kinds of operations, such as powing, handling teams, shearing sheep, etc.

The employment of women is even more extensive in other countries at war, and in many places the temporary employment of soldiers has been of very great assistance. The Army Council in Great Britain issued instructions the past season that as far as possible farmers be loaned draft horses, mules, and drivers for help in harvesting in the neighborhood. In Germany special attention was given this year to the prompt and proper harvesting of crops. In many cases public work of all kinds was interrupted in order to set free labor for that purpose. The extensive granting of furloughs by the military authorities contributed considerable supplied of soldier labor. In some sections the help of school children was enlisted in gathering the potato crop. France, Germany, and England to some extent, have made use of prisoners of war in carrying on farm work, the custom being to require the employer to pay a small wage for the services and provide suitable conditions for living. The results have generally surpassed expectations.

The various measures in aid of agriculture have prevented fine examples of cooperation between national, state, and local agencies. There has been cooperation between the civil and military branches, supported by a realization of the necessities of each, and between governmental and private organizations, often formed voluntarily for the purpose. The strength which this union of effort has given has enabled agriculture to maintain itself under most trying conditions.

But the measures for maintaining the food supply and other necessities have not stopped with the physical means of production. They have extended to advice and direction on the side of better farming, the conservation of supplies, and the utilization of new sources. The effort has tested ingenuity and resourcefulness to an unusual degree, and in this direction has led to new demands upon the various classes of agricultural institutions. It is interesting to note especially the effect upon the activities of the experiment stations and other agencies of research.

As was natural, there has been a decrease in the kind of activity which has characterized the European stations in normal times. The product of their past work has, however, become a source of great strength and resourcefulness in the countries at war. It has been drawn upon to a hitherto unprecedented degree, even that of more theortical character. The years of experiment and investigation and application have been realized upon in a way which has furnished renewed conviction of the practical value of such effort. Coupled with systematic agricultural education and the various forms of instruction and advice given upon farming, it has enabled effective resistance and decreased suffering.

The forces of many of the experiment stations have been considerably depleted by the war, through drafts for field service and death, and through the diversion of their activities in other directions. A station in Austria reports that it has been turned into a hospital; others have been largely diverted to making the necessities of life, serum, war munitions, etc.; a prominent investigator in Russia writes that he is now occupied in making preserved foods for the army on a commercial scale. In general the investigation is taking more practical forms. even among men whose previous work has been especially along theoretical lines.

The director of the Rothamsted Station, writing at the close of last year said: "The war is of course affecting us, though less than we thought it would. My young men have now practically all gone or are on the point of going, but their places are being filled by women so that the work continues. Naturally, of course, the objective has altered and the more academic problems are put on one side in order that more urgent matters can be dealt with. Much of our work now is advisory and some very interesting problems are turning up."

This advisory work and the making of tests and trials of various kinds are being participated in generally by the agricultural institutions in England and other countries. Nearly every number of the Journal of the Board of Agriculture contains notes on feeding stuffs, with suggested rations, prices per food unit, and similar information, supplied by the Animal Nutrition Institute of Cambridge University; advice as to sources and values of commercial fertilizers occupies a prominent place, and there are reports of numerous simple practical trials of fertilizers and feeds for immediate application. In some countries rules for the practical farmer are being worked out, and elsewhere tests made of new materials to serve as substitutes in agriculture or to replace the necessities of life in time of scarcity and high prices.

The maintenance of the industry on an efficient basis, with many of the ordinary supplies of fertilizers, feed, spraying materials, etc., diminished or cut off, has taxed the fund of knowledge and the resources of agricultural science. The high price and scarcity of copper has led to experiments to secure substitutes for copper

Mr. Ward Raised $43,000 Worth of Potatoes

Farmers are getting $4.00 a barrel for potatoes. Mr. Benjamin H. Ward of Aroostook County, Maine, raised 10,882 barrels (29,925 bushels) on his 75 Acre field last season. This is not an unusual yield but with the unfavorable weather conditions last season it is greatly above the average.

Did You Raise 399 Bushels Per Acre Last Season?

Mr. Ward insured his profits by furnishing his crop with an ample supply of *E. Frank Coe Fertilizers.* He wrote us recently:

"I have used the *E. FRANK COE Brands* continuously on my farm since 1912, and they have always given me entire satisfaction. The crop which I secured this year is, I believe, fully equal if not better than any crop raised in my section of the country as I produced a total of 10,882 barrels on a measured 75 acre field. (Equal to 399 bushels per acre.) . . . I used 1,500 pounds of *E. FRANK COE'S Excelsior Potato Fertilizer,* 1916, per acre at the time of planting and applied 500 pounds per acre as a top dressing just before leveling off the hills. . . . Please increase my order for 1917 to 100 tons."

Why not insure *your* profits in the same way and order a generous supply of *E. Frank Coe Fertilizers* for your 1917 crop? Potatoes, corn and all kinds of farm produce are selling at high prices. The demand for food stuffs is greater than the supply. Will you help America feed the World?

Our practical book entitled, *"Potatoes, A Money Crop"* will tell you how the best potato growers in Aroostook County and elsewhere insure successful crops. If you wish to increase your crops and your profits send for your copy today.

If you will tell us the number of Acres of potatoes you intend to plant next year we will mail you a copy of this book free of charge. Ask for our prices on potato fertilizers. They are used by the best farmers in the northeastern United States.

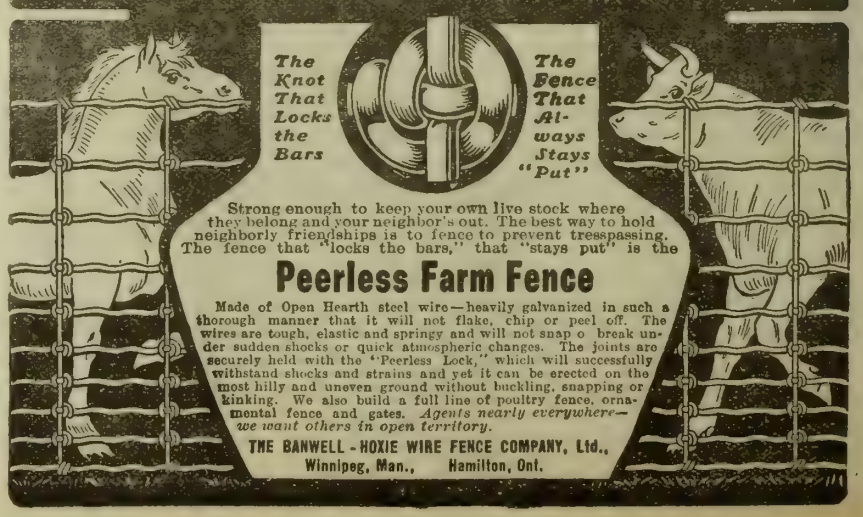
PEERLESS PERFECTION



Strong enough to keep your own live stock where they belong and your neighbor's out. The best way to hold neighborly friendships is to fence to prevent tresspassing. The fence that "locks the bars," that "stays put" is the

Peerless Farm Fence

Made of Open Hearth steel wire—heavily galvanized in such a thorough manner that it will not flake, chip or peel off. The wires are tough, elastic and springy and will not snap o break under sudden shocks or quick atmospheric changes. The joints are securely held with the "Peerless Lock," which will successfully withstand shocks and strains and yet it can be erected on the most hilly and uneven ground without buckling, snapping or kinking. We also build a full line of poultry fence, ornamental fence and gates. *Agents nearly everywhere—we want others in open territory.*

THE BANWELL-HOXIE WIRE FENCE COMPANY, Ltd.,
Winnipeg, Man., Hamilton, Ont.

salts in fungicides. The hot water method is being reverted to in treating seed for smut, and lime-sulphur is being given wider use. In France, unusually heavy losses were sustained from black rot in the vineyards, because of the inability to spray as much as usual.

Everywhere special stress is laid on the control of diseases and other injuries of standard crops like cereals, potatoes, beets, and grapes, to protect the food supply. We read, also, of efforts to prevent losses other than those due to insects and plant diseases, such as the killing off of wild animals, birds, etc., which injure or feed upon farm and garden crops, and of restrictions placed on the feeding of wild game.. Unusual stress is laid upon procuring good seed which will yield large returns, and special efforts have been made to provide such supplies. Plant diseases have been studied mainly from the practical side, with special reference to their control. The entomological studies have dealt largely with the relation of insects to the spread of disease.

Naturally there has been a great deal of work along food lines, with tests of various kinds of material for human food and for feeding stuffs. Yeast preparations, for example, have been devised as substitutes for meat, and found very digestible, and an egg substitute has been made from blood serum. Food preservation has taken great strides, especially desiccation by freezing or drying.

A process has been devised for preparing a cattle food from potatoes which can be kept for a long time with small loss by fermenting small and refuse potatoes in vats by means of special cultures. To meet the need for stock feed in Germany, methods have been perfected for utilizing straw, peat, and other coarse materials by chemical means and by fermentation, reinforcing the product with dried yeast or with potato flakes and molasses. Many substitutes for oats have been devised and experimented with, among others one called chicory crumbs, made from dried chicory roots.

In veterinary lines there has been much investigation upon antiseptics to take the place of more expensive ones, sugar and sale being found effective in many cases in the treatment of animal wounds. The use of polyvalent serum, formerly used in the treatment of human wounds, has been applied to animals. Some of the institutions formerly prominent in research work have been quite extensively occupied in serum making. Considerable work in the veterinary line is reported as coming from the field service instead of the laboratory.

In Germany there has been much activity in the fixation of atmospheric nitrogen, for general uses and for fertilizers, some marked advances having been made in the direction of efficiency and economy. Small beets, cull apples, beet residues, etc., are being employed in alcohol making; and many studies are reported on vegetable sources of oil.

The testing of farm machinery has been given special impetus on account of shortage of labor, and in some sections cooperative farm implement societies were formed to provide funds for their purchase or joint ownership. Of late, however, some difficulties have been experienced in securing the allotment of petrol for their operation. It was announced during the past summer that the Italian Government contemplated extensive purchases of labor-saving agricultural machines, to meet the difficulties caused by lack of farm hands—a new experience in that country.

Naturally the effect on the character of the agricultural literature from abroad has been quite marked. The standard journals come less frequently and several have been suspended. Many of the research articles now published relate to work done prior to the war, rather than current investigation; and summaries of old work are common, to point out the practical application of the results. The more strictly scientific publications, especially the publications of scientific academies and the general review journals, show a much reduced size as compared with the volumes of 1913 and 1914. This is, of course, to be expected, and the wonder is, not that so relatively little but that so much new investigation is being recorded at this time.

As noted above, there is unusual activity in the direction of popular articles based on good scientific practice, results of tests of substitutes for the customary articles of food, feeding stuffs, fungicides, fertilizers, textiles, etc., immunization against disease, and advocacy of the raising of small animals for food, such as poultry, rabbits, goats, etc., the latter occupying much space. There are reports of field crops tried out to supply local deficiencies, such as oilseeds and fiber plants in Germany; new varieties developed with a view to increased production on limited areas, tests of crops in regions in which they have not previously been grown to advantage, such as sugar beets in southern France, the feeding value of various unusual or waste products, and the like.

Several standard periodicals have suspended publication, among them apparently the Annales de l'Institut Agronomique de France and Annales de l'Ecole Naturale Agronomique de Montpellier; and nearly all the Belgian literature has ceased entirely. A notable exception is the Bulletin Agricole du Congo Belge, published by the Belgian Ministry of Colonies, which is now being issued in London, and two numbers of a new series Etudes de Biologie Agricole, which have been published by this ministry.

The agricultural literature from France has considerably diminished. Practically no scientific literature has been received from Germany since June, 1916, presumably on account of difficulties of transportation. The Italian literature shows less variation from the previous subject matter than does the French, German, and English. The official organ of the stations in that country, and also that of the Hungarian stations, has shown but little change.

Very many of the agricultural colleges and schools have felt the effects of the war. For example, in England the Royal Agricultural College at Cirencester, and the Agricultural and Horticultural College at Uckfield have been closed, and Armstrong College has been taken over as a military hospital, its agricultural department being temporarily housed in a dwelling.

Many of the French schools of agriculture had to close their doors on the outbreak of the war, but arrangements have since been made to open most of them. The national schools of agriculture at Rennes and Montpellier are being occupied by the sanitary service. A considerable number of the practical schools of agriculture and the farm schools have resumed operation, and several of these are receiving soldiers injured in the war.

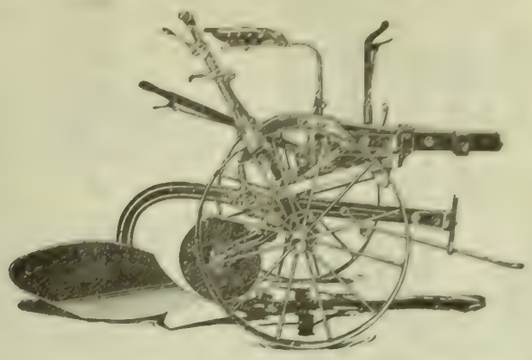
In Austria twelve farm schools, thirty-five winter schools, and seven elementary forestry schools were temporarily closed on account of the war. Several minor institutions in Germany closed their doors temporarily, and the courses and attendance at the larger universities were much affected.

It is interesting to note that for the past two years the program of the British Association meetings has shown indications of the war's influence. The address of the president of the Agricultural Section last year dealt with the subject of farming and food supplies in time of war, showing the share contributed by British agriculture to the national food supply, and the extent to which it had assisted in making good the lack of supplies cut off by the war. This year the presidental address before that section was by Dr. E. J. Russell, director of the Rothamsted Station, and was on the subject of The Possibilities and Prospects of Increased Food Production.

The bulk of Dr. Russell's address was devoted to a consideration of the means of increasing the yield per acre, and of reducing the cost per acre and the uncertainties of production. He pointed to certain modifications and adaptations in the interest of larger production, notably a closer coordination of crop variety, soil and climatic conditions, increased efficiency in fertilizer treatment, and improvement in the management of barnyard manure to avoid waste. He also referred to the need of agricultural education to raise the ordinary farmer to the level of the good one, to the extension of the area of land under cultivation by the reclamation of waste, and to the substitution of arable crops for grass. The manner of treatment of the subject showed a broad grasp both of the opportunities and the means of extending production; and was typical of the liberal, scholarly study which is being given the subject at this time.

The war has gone a long way to impress upon governments and the public generally the vital position which production occupies and the advantages of the new agriculture. The supreme importance of scientific research in all branches has been impressed upon the countries of Europe by the most remarkable demonstrations ever furnished. In these dem-

Good Plowing Done Here



Take a simple type of two-wheeled sulky plow like the Oliver 26, equip it with a suitable bottom, and put it into the hands of an Eastern Canadian plowman. There is an unfailing recipe for good plowing. The Oliver 26 sulky handles like a two-wheeled cart. It has a pole shift that changes instantly the landing of the beam, making it as easy as can be for the operator to straighten crooked furrows, to turn short corners or to plow side hills. The land wheel has a range of lift that insures good work on rough ground, around dead furrows, and in finishing out a land. No plow made works better on rough, uneven land or can be backed more easily. It has a horse lift that eases the work of the plowman without tiring the horses. Taking it all together, there is no handier plow than this sturdily built Oliver 26.

Other Oliver plows from engine and riding gangs down to walking plows, complete a line in which you can find any particular plow you may happen to need—a plow that will help your reputation as a good plowman and good farmer—at a price you can afford to pay. May we send you our folders telling all about Oliver plows for Eastern Canada? Write to the nearest branch house.

Rock and Brick Face "METALLIC" Siding

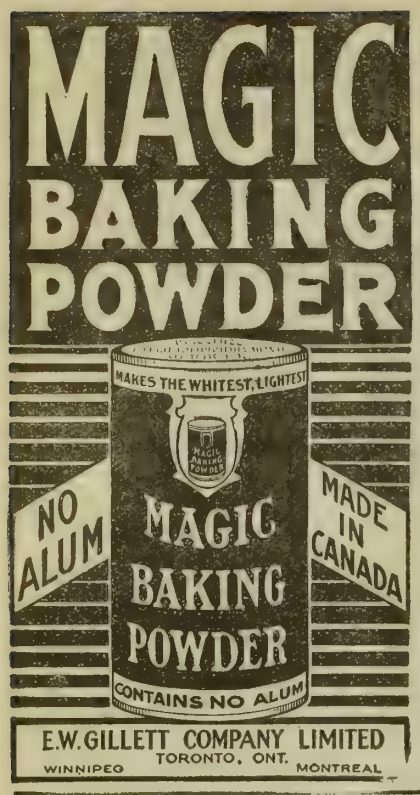
Gives an armour-clad building that defies time—weather—fire—storms.

PUT heavy, full gauge Galvanized "Metallic" Steel Siding plates on your building and you have a steel coat that simply laughs at old Father Time.

Needn't paint for years unless you want to—unlike inflammable wood that needs constant protection. "Metallic" plates are absolutely wind, snow, rain, fire and storm proof. "Metallic" patterns are many and pleasing, the Rock and Brick-face and Clapboard being the most popular. Send for price list today. We can save you money.

We also make "Eastlake" Galvanized Shingles; "Empire" Corrugated Iron "Metallic" Ceiling Plates; Ventilators; Roof-lights; Silo-roofs etc.

The Metallic Roofing Co., Limited, - Winnipeg and Toronto



onstrations and convictions the indispensableness of science to an adequate agriculture has been given a new understanding; and in the general results the institutions and working forces charged with the prosecution of science and education in agriculture have richly shared.

THE NOVA SCOTIA FRUIT GROWERS' CONVENTION

(Continued from page 200)

Rev. G. P. Raymond, Aylesford, read a paper on "Sod Culture for Our Orchards", which brought out an interesting discussion.

"Profitable Small Fruits for the Annapolis Valley," was the title of the other paper, which was read by R. D. L. Bligh, Kentville, in which he pointed out by the means of statistics the room there is for a great expansion in small fruit growing in Nova Scotia.

Resolutions of thanks for accommodations and courtesies and the singing of the National Anthem brought to a close the series of interesting and instructive meetings.

ORCHARD PLANTED ALONG ROADSIDE

Elberta peach trees will be planted along both sides of a road extending across Missouri from Kansas City to Louisiana. This new highway, with its attractive border, will be called the Elberta route. So far as it is known, this is the first time any attempt has been made to work out such an idea in this country. In Europe many of the roads are planted with fruit trees and a large part of the expense of up-keep is paid by the income from the fruit. Thus they are largely self-supporting. How well this idea will work under our different conditions is, of course, uncertain. It is an attractive scheme, and certainly is deserving of success. Some method will have to be devised for the protection and care of these trees, but according to Colonel Buffum, Missouri highway commissioner, such arrangements will be made at the next session of the legislature. These roadside trees might furnish a splendid opportunity for demonstration work under the direction of the state or government authorities. One thing is certain, at peach blossom time in the spring this road would probably have considerably more than its share of the tourist traffic. The whole thing is a big idea, and it will be watched with interest.

A WAR TIME N. S. A. C. SHORT COURSE

The short course conducted at the Agricultural College at Truro, N. S. from Jan. 2-11 last was the most successful in the history of the College. This course was advertised as a "war time" short course, and it was urged that farmers and their sons, who could not get away for any length of time, should make a special effort to get to the College for the two weeks course with a special view of acquiring knowledge that would enable them to grow bigger crops than ever in 1917. The appeal seemed to catch on, for altogether some where between 400 and 500 farmers attended the course, and from beginning to end the average attendance at the daily classes was something over 250. All, with the exception of ten, came from the province of Nova Scotia.

This large attendance and the enthusiasm and interest manifested during the course augers well for the continued advancement of agriculture in the province of Nova Scotia. The crop returns of the past two years have indicated a substantial increase in farm production, and it looks now as, even with the large reduction in labor, due to enlistment, the farmers of this Eastern province will still maintain, and in many cases increase the production of their farms. "Grow things" in 1917 is the forword of the Department of Agriculture, and if the season is at all promising, there is no doubt that the farmers will do their part.

One of the best sessions held during the short course was the "National Service Session." It was addressed by G. S. Campbell, Chairman for Nova Scotia of the National Service Board, and Captain Campbell, Chief Recruiting officer for District No. 6 for Nova Scotia. Both of these men laid stress first on military service for those who were fit and who could leave their homes, but they added that if a man was convinced that he could not render this form of service, then he should do "his bit" by exerting greater effort than ever to produce things. Both concluded by giving an inspiring and encouraging message to the farmers of Nova Scotia to do "their bit" by growing bigger crops than ever in 1917.

BISSELL Double Action Harrows will thoroughly cultivate and pulverize any soil. One Harrow is Out Throw; the other is In Throw. They are simply constructed, rigid and durable. The Gangs are flexible and the Disk Plates are so designed that they "hang" right into the soil. Bissell Harrows are built in sizes and weights suitable for horse or tractor use. Write Dept. M for free catalogue. 98

A HINT TO YOU

The following is a sample letter which the Maritime Farmer is frequently receiving from advertisers:—

Dorchester, N. B.
Jan. 17-1917.

Editor of The Maritime Farmer,
Sussex, N. B.
Dear Sir:—

Please do not let my ad appear again as all the sheep advertised are sold and still letters come pouring in.

Yours truly,
Andrew McPherson.

The Maritime Farmer is without doubt the best advertising medium in the Maritime Provinces to patronize if you have live stock of any kind to dispose of.

Get our rates for permanent breeders ad, for a breeders line, or condensed advertising.

In making arrangements to hold meetings in rural districts, those in charge should put forth a special effort to get out and develop the home talent; in other words, it pays to promote local leadership.

"Astonishing how my

Strength and Fitness

came back," says Mr. Inman, a Winnipeg business man, cured by Dr. Cassell's Tablets.

"It was astonishing how my strength and fitness came back," says **Mr. G. C. INMAN, of 330, HARCOURT STREET, STURGEON CREEK, WINNIPEG,** for many years a well-known man in the business life of Canada. Mr. Inman continues: "It is about three years now since I first used Dr. Cassell's Tablets. I was terribly run-down and weak. Sometimes I felt I should have to leave off altogether, my work was such an effort to me, I ate little, I had no appetite, and I suffered if I forced myself to eat.

"My nerves of course were in a bad way, and my sleep very disturbed. Everything, in fact, pointed to a nervous breakdown. It was then a friend told me about Dr. Cassell's Tablets, and I got some to try. The first result was that I could sleep at nights, and then my health rapidly improved. It was really astonishing how my strength and fitness came back.

Mr. G. C. Inman.

"I may add that some time ago my mother was very ill with pernicious anæmia. I urged her to take Dr. Cassell's Tablets, but she would not, so I crushed them down, and gave them in food without her knowing. She was confined to bed before she had the Tablets, and now is about again well and bright."

Mr. Inman is now in England, having had to return there some little time ago to take control of the well-known firm of A. W. Inman and Son, Printers and Publishers, Leeds. Letters will reach him there.

SOLUBLE POISONS TO CONTROL THE ADULT OF THE APPLE MAGGOT.

Soluble poisons in the poisoned bait spray to control the adult of the apple maggot (Rhagaletis pomonella).—Experiments conducted during 1914 and 1915 are reported in Maine Sta. Bulletin:—

No conclusions can be drawn on the effectiveness of the poisoned bait spray from any of the experiements performed during 1914 due to the fact that the different soluble poisons scorched the leaves and therefore insoluble arsenicals were then substituted. A sreies of experiments with different amounts of soluble poisons, such as potassium and sodium arsenate and sodium arsenite, show that as small a quantity as 0.25 oz. of these insecticides dissolved in boiling water and then added to 3 gal. of water with one pint of molasses will burn the foliage of the apple trees.

"In 1915, during a very rainy season, the results obtained with three applications of the poisoned bait spray containing a soluble poison dissolved in diluted molasses (potassium arsenate .75 oz., molasses 1 pint, and water 3 gals.), showed that the infestation varied from 0 to 20 per cent in orchards situated away from the margin of the experimental area, and from 32 to 57 per cent in orchards near untreated trees. An even distribution of the droplets over the foliage is more effective than spraying the trunk, large limbs, and foliage of the lower branches. The number of applications necessary to insure good results can not be stated with this work still in its experimental stage. In orchards where tent caterpillars have practically stripped or partially defoliated the trees the poisoned bait with the use of a soluble poison can not be advocated. In orchards where tent caterpillars are controlled, defoliation caused by spray injury is far less than the damage caused by these pests in neglected orchards. Our experience shows that after fruit growers have been convinced of the results obtained by the use of the poisoned bait spray, many prefer sound fruit even if burned foliage is the necessary price.

"The fruit fly remedy has been a complete failure in the control of the pest under town conditions. With four applications of the spray the infestation varied from 4 to 98 per cent."

RID TREES OF CANKERS

Cankers on apple trees are due to various causes, such as infcetion from fungi in areas killed by pear blight, or in wounds caused by insects or other injury, and the character of the canker may be determined by sending a sample to your Experiment station.

"There's a poor choice among rotten apples," and we do not care to take our pick of cankers, for whatever their particular characteristics they are all subject to the same cure—namely, cutting off and burning of the diseased limb.

Sometimes the affected portion can not be well spared from the tree, and, when this is the case, the whole affected area should be cut out well beyond the apparently diseased portion, and the wound should be treated in the same manner as where the limb has been removed, namely, disinfected and painted, or a wound paint of coal tar and creosote oil should be applied.

HOW TO BUY TREES

When starting an orchard every grower questions what varieties he should plant. Let us advise him to use such well-known varieties as have proved suitable to the soil of his locality. If he wishes to experiment a bit, NEW varieties, somewhat apart from his commercial orchard.

It is generally cheaper and more reliable to buy your stock from an established nursery than from an agent. Even if he be an accredited representative of some good nursery, he is a middle man, and as such entitled to his percentage, but the wise farmer will not pay it to him. He will go to the nearest nursery of which he knows the reputation, or if such be lacking, he will be guided in his choice by the advertisements he sees in his fruit paper.

All farm papers now make an honest effort to carry only such advertising as is backed by reputable firms, and the farmer saves himself time, trouble and expense by making use of its columns to direct him in making his decisions.

Better Crops Result From Spraying

This K apsack is ideal for spraying small plots of potatoes, shrubs and all small fruits. It is strongly made, powerful and easily operated. We make the Spramotor in a size and style for every need—operated by hand, horse or gasoline power. Prices range from $8.00 to $400.

HOGS NO HELP IN ORCHARDS

It is frequently claimed that an orchard it benefited by turning hogs into it. They eat up so much refuse, that they help to reduce the number of pests that always harbor in rotting fruit.

They do this and more. They eat the bark, and often girdle trees, thus causing their death. It is true that a hog fed on ideal rations is less apt to resort to gnawing bark, but it is a risky thing to relp upon furnishing exactly the food that will satisfy their craving for the kind of nutriment found in the bark. With hogs, as with people, there are certain individuals that have what is called a morbid appetite, and one hog with such a taste may do more harm than all the rotten fruit the whole of the rest of the bunch will eat.

All hogs rub themselves against the trees, and this also is injurious to the bark. Best get a separate pasture for your live stock or give up the idea of raising both hogs and fruit.—American Fruit Grower.

Instant Relief for
Biliousness
and other Liver Troubles

The astonishing efficacy of Dr. Cassell's Instant Relief is due to its toning effect upon the liver and bowels. It gives strength to the organs and helps them back to health and natural action. In other words it enables the system to cure itself. Don't weaken your liver with purgative pills or morning salts, don't get the salts-taking habit; let Dr. Cassell's Instant Relief bring you natural and therefore lasting cure.

Dr. CHAS. F. FORSHAW, D.Sc., F.R.M.S., a well-known British Scientist, writes:—"Never take Salines or Purgatives for Constipation—to force Bowel action is to aggravate the trouble and create the Constipation habit. I recommend as a superior and convenient treatment Dr. Cassell's Instant Relief."

Price 50 cents. from all Druggists and Storekeepers,

or direct from the Sole Agents for Canada, Harold F. Ritchie and Co., Ltd., 10, M'Caul-street, Toronto. War tax 2 cents extra.

Dr. Cassell's Instant Relief is the companion preparation to Dr. Cassell's Tablets.

DAIRYING.

CAPACITY AND PRODUCTION MARKS DAIRY COW'S VALUE

In these days of big things no business is looked upon as being successfully operated unless it is run to the limit of its capacity. Competition is keen in all directions and in order to meet it, with any degree of assurance the machinery of business must not be idle at any time nor yet doing only half of the work it is capable of performing. The manufacturer knows, by actual experience, that other things being equal, the larger the machine the greater will be the net profits. The reason is obvious. Invested capital in small affairs is always proportionately greater than in large ones. A great deal of time is employed in preparatory work which is no greater in large things than in small. The oversight is proportionately much greater, taking little more time in the one case than the other, while it will readily be recognized that supervision of operation is practically the same in both.

On the farm, business principles are practically the same as in other lines of trade. This does not mean that all farms should be large, nor does it mean that all lines of business should reach mammoth proportions. It means only that all lines of business, whether on the farm or in other places should be run to its fullest capacity and with the largest machinery suited to its purpose.

On many farms in Canada the principal machine is the dairy cow. From an economic standpoint, the farm should differ little from that of any other manufacturing plant. The same object should be kept in view, namely, to place upon the market a useful article that will cater to the needs of the community or country, and in no other line can the farmer better accomplish this object than in producing a wholesome article of delicious milk.

As everyone knows there is only one kind of machine for this purposefi but at the same time, there are a great variety of patterns, sizes and capacities. While one farmer or manufacturer prefers one size or pattern and another something else the thing that really counts in the end is the one that produces the most at the least cost; or in other words, the machine that turns out the greatest quantity of finished product in proportion to the amount of raw material used for that purpose. On general principles as has been noticed, other things being equal, this will be the largest animal. Experiments have shown that as a rule large cows of a shown that as a rule large cows of a given breed are more economical producers than small ones.

At the dairy test in Chicago at the World's Fair in 1903, calculating the cost of 100 lbs. of fat the result favored the heaviest cows, though the difference was small.

Prof. Brandel conducted three experiments with light and heavy dairy cows, each lasting four weeks, the second commencing seventy days after the close of the first, and the third a year after the beginning of the first. Thirty of the heaviest milkers in the herd were separated into two lots of fifteen cows each according to live weight. The cows were kept under similar conditions as to feed and care during the trial, none being bred after the beginning of the experiment. The average weight of the heavy cows was 1,205 pounds and of the light cows 979 pounds. The leading conclusions from the experiments follow:

1—The milk of the small cows was found to be richer in fat than that of the large ones.

Show Your Practical Sympathy with Slave-Raided Belgium

If ever Belgium needed sympathy—OUR sympathy—she needs it now! To the ravages of fire, sword and a savage, brutish soldiery, Germany has added deliberate, cold-blooded slave-raiding.

Over 100,000 Belgian workmen have already been snatched from their homes and taken into slavery in unknown places. The mothers, wives and children who beg for their release are driven back by the Huns in utter despair. Neutral protests have failed to change Germany's inhuman purpose, nor can the Allies free Belgian manhood until the Teutons are crushed.

But we can save the women and children through the neutral Belgian Relief Commission, which is feeding three million of them. We can express our indignation, and our sympathy with our Ally's wrongs, in a practical way, by giving more liberally than ever to the Belgian Relief Fund.

Make this a personal matter! Decide what you can afford to give, and send your subscriptions weekly, monthly or in one lump sum to Local or Provincial Committees, or

Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers. Box P. 309 Windsor, Ont.

BUTTER PARCHMENT

per thousand lbs. live weight they eat less.

3—The small cows produced less milk than the large cows, absolutely and relatively.

4—When in thin flesh small cows may produce more per thousand pounds live weight than large cows.

5—Large farrow cows were more persistent milkers; on the other hand, small cows showed a greater tendency to fatten on the same feed, with a decrease in milk flow.

In all breeds of cattle there is, no doubt, a limit to which the size of the females may profitably be carried but at the present time where quality is not allowed to deteriorate, there seems to be little danger of overtopping the grade. Even allowing that the largest speciment of the various breeds are large enough for their particular sphere in the dairy world of today there is surely plenty of room for the medium and small animals to travel the up-grade road for several generations yet before they will reach the plane of largest yields and greatest profits.

Many, no doubt, will not care to accept the conclusions that the larger class of cows are the more economical producers; but even granting that they are equal in this respect there is yet much to be gained by improving the size of the average herd throughout the country. No well organized farm will care to invest in twenty head of cattle that will only do the work of fifteen, for even though the initial cost be no greater, there are other reasons to be considered that make it an object of considerable importance to invest in the larger cows.

One of these is the risk of loss by accident. No herd is absolutely free from danger in this regard and the relative danger, if anything, is increased with numbers, a fact too evident to need any argument. The greater the number the more crowding, slipping, hooking and other features that make for this source of loss.

Again the matter of housing is a very important matter. In a herd of twenty cows 33 1-3 per cent. more room would be required for stabling than if the herd were only fifteen in number. Therefore if the latter cost $1,500 an additional $500 would have to be expended and a yearly indemnity besides for upkeep.

In the matter of care, too, the owner of the larger cows would be in much the better position. It will be a reasonable deduction in a herd of fifteen cows instead of twenty to place the labor for this extra care at three-quarters the larger number which in the course of a year would mean a large saving in time in favor of the big cows. Then the milking alone of five cows night and morning for ten months of the year is in itself a problem of considerable importance.

Another thing greatly in favor of the large cow is the fact that she is in greater demand than her smaller sister, whether in the sale ring or the show ring, other things being equal the large cow gets the preference. Public opinion counts for a good deal. While its judgment is not always correct regarding values, there is every reason to believe that in the main it is right and at least it will always be a strong factor in the guidance of breeders to a definite line of action in supplying its needs.

In the final analysis, however, of the value of cows the capacity of the individual to consume food and give a good account of it in the pail as decided by the scales and the Babcock test will be the determining factor. There are cows and cows both in the large and small classes, and there are many surprises in individuals. The business of the dairyman is to get onto the main line of this industry where there are fewest of these.

COST What you put into a Cream Separator VALUE What you get out of your Cream Separator

It isn't the "out go" but the "income" that determines the real value of a Cream Separator

It's Cheaper to Buy a

DE LAVAL
CREAM SEPARATOR

VALUE depends upon the amount and the quality of service the article gives you—what you get out of it.

You get by far the greatest actual VALUE for your money when you buy a De Laval—BECAUSE it will give you much better and longer SERVICE than any other separator.

From the standpoint of its greater durability alone, the De Laval is the most economical cream separator to buy, and when you also take into consideration its cleaner skimming, easier running, greater capacity and less cost for repairs, the price of the "cheapest" machine on the market is most exorbitant compared with that of the De Laval.

And there is no reason why you should let its FIRST COST stand in the way either, because the De Laval may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

"MORE BREAD AND BETTER BREAD"

Butter Parchment at the Farmer Office

COULD NOT SWEEP BACK WAS SO SORE.

Women are coming to understand that weak, lame and aching backs from which they suffer so much excruciating pain and agony are due to wrong action of the kidneys.

On the first sign of any weakness in the back Doan's Kidney Pills should be taken.

Mrs. L. Gonshaw, 683 Manning Ave., Toronto, Ont., writes: "I take great pleasure in writing you, stating the benefit I have received by using Doan's Kidney Pills. About three years ago I was terribly afflicted with lame back, and was so bad I could not even sweep the floor. I was advised to use Doan's Kidney Pills, and before I had used one box there was a great improvement, and my back was completely cured. I highly recommend 'Doan's' for lame back."

Doan's Kidney Pills are put up in an oblong grey box, the trade-mark is a Maple Leaf, so accept no other.

Price 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

When ordering, direct specify "Doan's."

LIVE STOCK.

THE BRROD SOW NEEDS GOOD CARE FOR BEST RESULTS

Unless this has already been done, it is not too early for those who are wintering brood sows to be putting things in order for their proper care and management. A brood-sow is not unlike other farm stock, in many particulars, and if she is worthy a place at all on the farm she should be given, at least, a reasonable chance to "make good" in her department of farm economics.

The practice on many farms is to simply breed the sow in the fall and then let her "rough it" during the winter with little food and obtaining shelter anywhere that happily she may find it. It is positively cruel, the treatment that some of these poor brutes receive and the owner of any animal should be forced to make them comfortable or have them confiscated. To say the very best that can be said of such a policy, it is not at all in the line of good business. In order for any animal to do its best it must be kept in congenial surroundings and be properly fed, and the brood-sow cannot bring forth a strong, healthy and well developed litter of pigs unless these essentials have been observed.

The first essential is a comfortable place to sleep. This need not be expensive. The main thing is to have it dry, fairly warm and free from drafts with plenty of sunlight. Dampness is the worst enemy that the pig has to contend with. They will not thrive when their quarters are damp. In order to prevent this evil, it is advisable to change the bedding frequently, no matter where it may be situated. Moisture rapidly conducts heat from the body, making an animal uncomfortable, taking more food to keep up the requirements of her system and favors the multiplication of disease germs.

The pig is practically without hair and on this account it peculiarly sensitive to cold winds and drafts. Good ventilation and sunlight is the best guarantee against disease germs that can be secured and is comparatively cheap.

Another feature that must not be overlooked in the management of the surroundings are pleasant she will move about all that is necessary, but if very cold she will likely lie in her nest too much of the time. She should therefore have a shed or pen in which to feed and exercise as well as sleep with a little hard feed scattered in the litter for which she will search and enjoy the situation.

A fairly good sleeping place may be made beside a straw stack, if no permanent place is at hand, by setting two posts a few feet away and parallel with it. To these wire a good strong fence rail. Then by taking other rails and layine one end on the stack and the other under the horizontal and wiring them to it and by covering these with a good layer of straw a warm roof may be made. One end of this pen should be closed up or built against the barn so that no draft will go through. However, there should be in addition to this a place for exercising and feeding as before mentioned. Coming from a warm nest out into a cold yard to feed or exercise is likely to induce bronchial or lung troubles and should be carefully avoided.

Several breeders prefer the single portable pen for brood-sows rather than several under one roof. These may be built on runners and can be moved from place to place where needed for convenience. Where this is done each sow should have from 50 to 60 square feet of floor space in the form of a square or rectangle. An A shape is a good form, easy to build and may be placed on joist laid on the runners, to which a chain can be attached for moving. If sows are allowed to farrow in them they should be built warm and have a door on hinges which can be closed in extreme weather and when the pigs are very young. With a good glass window in each end and a ventilator which may be opened and closed by a cord this will prove to be a healthful and useful method if other conditions already mentioned are observed.

The kind and quantity of food is very important. At this season of the year and under domestic conditions an animal cannot get the natural succulent foods required to keep her system in a healthy state. Hence the breeder should be careful to provide these, or otherwise digestive disorders will likely result. Too much hard grain should be avoided and the diet should be composed, in part at least, of laxative foods. For this purpose sugar beets and mangels are excellent and greatly relished by the sow if fed in a comfortable place. Corn ensilage is also good and is readily eaten and the exercise gained by the slow process of feeding of this kind of food is especially beneficial.

The quantity of food should be carefully regulated. While it is essential that the brood-sow should be in good strong condition and have plenty of flesh at farrowing time it is equally important that she should not be over fat; for in this condition she is likely to become lazy, feverish and lie down on the little ones. There is also great danger that her milk will be too rich and cause digestive troubles in the young pigs.

It too often happens that one knows enough about his business, but neglects to do the thing he knows ought to be done at just the right moment, and through this neglect the thing that in all probability would have proved a great success is doomed to failure.

There is little use of education unless the knowledge is properly applied and the details faithfully observed. Indeed, it is more often likely to lead to disaster than to subserve any good purpose unless faithfully applied to some good object for through its influences many things are undertaken which not being carried to a practical conclusion result only in loss and disappointment. And

IMPORTANT AND PREPOTENT BULLS

I have a pure bred Holstein bull that thus far has proven impotent. He was not used for herd service until he was a year old. He is now one year and ten months old. Is there any hope of his becoming serviceable?

H. A. G.

It is extremely unlikely that, after failing in ten month's trial in the herd to prove potent that this bull will be of any great service. At least it is not likely to pay to keep him. The best plan is to dispose of him to the butcher and to purchase in his place a sire that has proven himself a good breeder.

Hundreds of good three and four-year-old pure bred sires are regularly being sacrificed to the butchers' block for want of buyers who are willing to take them to use in other herds, and the only reason such bulls are for sale is that the owners can

BT Barn Book
Learn How to Build a Barn Like This
Learn how to build the best barn in the county, a barn that your neighbors will envy, a barn that will look so fine that the appearance alone will add greatly to the value of your farm. Learn cheaper, better ways of framing. See how to lay the floors and foundations and how to build the walls. See how to build ventilation inlets and outlets and frame cupolas for foul air shafts.
All these things and a great many others are explained in the BT Barn Book.
It is free to you for the coupon.
Barn Book Shows You How
It shows you how to build your barn yourself, or how to remodel and make it as good as new. It contains 75 full page and double page pictures of good barns and 13 big blue print drawings. Also, it has all kinds of information about measurements, sizes of materials for plank framing, capacities of silos, capacities of mows, etc. There are 14 working plans for barns and cuts showing what the barns would look like when completed. Shows steel stalls, water bowls, steel horse stable fittings, etc.
Send the Coupon
This book cost us thousands of dollars to print. It is the most complete book published on the subject ever offered. The information and photographs in it are worth hundreds of dollars to you if you are building or remodelling your barn. Yet we offer it free, for the coupon.
Thousands mailed last year and not many are left. Make sure of your copy by mailing coupon now.

CONSTIPATION

THE COMMONEST ILL.

Constipation is one of the commonest ills of mankind and one too often allowed to go unlooked after until some serious complication sets in.

If the bowels are properly looked after there will be no constipation, jaundice, sick or bilious headaches, heartburn, coated tongue, sour stomach, floating specks before the eyes, etc.

Milburn's Laxa-Liver Pills will keep the bowels regular and cure all liver ills.

Mr. Philip McLeod, Tarbot, N.S., writes: "I suffered from constipation ever since I can remember, and for years had pains in the left side of the back. If I walked across the kitchen floor I would have to sit down and rest. That I think was terrible for a man of 20 years of age. The condition of my system was shown by pimples breaking out on my face. I suffered so much pain and stiffness in my back I am sure my system was full of poison. Milburn's Laxa-Liver Pills have entirely cured me.

I thoroughly recommend them to everybody."

Milburn's Laxa-Liver Pills are 25c. a vial, 5 vials $1.00, at all dealers or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

no longer use them in their own herds, because the bulk of the females in their herds are daughters of these bulls.

Among the three and four-year-old bulls thus sacrificed, there have been many whose daughters afterward proved to be really great producers. However, they were gone and could not be recalled, when they might have produced equally good producing daughters in other herds, had dairy farmers in need of good bulls had the foresight to purchase them.

Bulls at the age of three and four years are usually just at the height of their breeding powers, and just why it is that farmers will not purchase them at that age, when others are no longer able to use them in their herds, for the reason already stated, is hard to understand. Such bulls it appears would prove their best prospects as sires; as they have already given evidence of their ability, which can be judged from the kind of daughters they have produced.

"STOMACH STAGGERS" IN YOUNG PIGS

I have a litter of young pigs that are subject to fits, and fall down as if dead for a minute or two. They have been that way for a week or so but none of them have died.

S. S.

Ans.—Your pigs are suffering from indigestion or "stomach staggers." Probably you have been too good to them, fed them heavily without giving the opportunity for exercise. Take the usual feed away, and give them some Epsom salts, a good teaspoonful each. Give this in a drink of skim milk. Give them no other food till they drink it. After the medicine has done its work, start feeding again gently with small quantities of their usual food; a small handful of linseed meal once a day in their usual slops of milk, etc., would be beneficial. Throw some coal or cinders into their pen and let them have plenty of roots to take the place of the summer green feed.

FEEDING A PRIZE CAR OF LAMBS

The champion car load of fat lambs at the Chicago International Exposition, and which sold for 21¼c per pound, was bred by crossing on ewes registered Hampshire buck lambs three-fourths fine and one-fourth coarse; that is to say, three-fourths Merino and one-fourth Cotswold. The Butterfield Livestock Co., Weiser, Idaho, bought the lambs, which were the product of this cross, July 1, at which time they took them off the public range and put them upon their own meadow land of blue grass and alsike clover, giving them a quarter pound of oats per head daily until October 1. They were then put into sheds and the grain was gradually increased until the time of shipping. Their grain ration consisted of two parts oats, two parts chopped wheat and one part linseed cake, with alfalfa before them all the time, and at the time of shipping they were getting 2¼ lbs. per head per day of grain. During this period the lambs had a two to three hour daily run in a rape patch. They weighed at the time of shipping 119 lbs., and then had a ten day trip to Chicago.

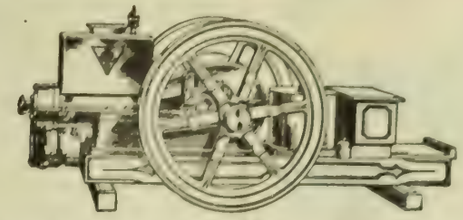
Their dressing percentage was 54.90. They were a most attractive load of lambs, as not only did their uniformity and finish stand out, but they were in true show form and were considered the best car of lambs ever exhibited at the International.

The actual financial result of the above load of lambs will, no doubt, be of interest. The cost of shipping, exhibiting and selling was within a fraction of $4.00 per head, the net selling value of the 54 lambs shown being $1,139.75, to which must be added $175 premium money, making a total of $1,139.75, to which must be added $175 premium money, making a total of $1,314.75, or the remarkable figure of $24.35 per head net.

TO HELP RELIEVE SCOURS IN CALVES

The first thing is to remove the cause and then give them lime water in the milk. Two tablespoonfuls twice a day for a calf two months old and for larger calves half a cupful. Make the lime water by putting a handful of lime into a pail of water, when it has slacked and settled, pour off the clear portion and bottle it for future use.

The general impression seems to be that in the raising of beef cattle for ordinary market purposes an animal showing the breeding characteristic to which it belongs and fed economic rations will make a profitable beef producer, but according to Prof. O. Severson of the Pennsylvania State College, this is an entirely wrong conception of raising beef at a profit, for he points out that selection in a



Think of all the work this ALPHA GAS ENGINE would save you

WITH this simple, strongly built engine you can saw wood, run a pump, cream separator, churn, washing machine, feed cutter or feed grinder, and save time and labor around your farm.

If you need a gas engine, it will pay you to buy a good one. An ALPHA costs little more to begin with than a cheap, poorly designed engine, and will quickly make up for any difference in the first cost by the longer and far more satisfactory service it will give you.

The ALPHA is simple and durable in construction and is free from any of the complicated, delicate parts that make some engines a constant source of irritation and expense. You can operate it with either gasoline or kerosene, and it will develop its full published rating with a minimum amount of either.

An ALPHA is a saving investment any way you look at it. It will save the money you now must pay out to get done work that requires power, because you can own and operate it for less than it would cost you to hire some one with an engine, and it will do quickly work you are now doing by hand and give you more time to attend to other work. The sooner you get an ALPHA, the sooner it will pay for itself.

Ask for catalogue, prices and complete information. Made in eleven sizes, 2 to 28 H. P. Each furnished in stationary, semi-portable or portable style, and with hopper or tank cooled cylinder.

PARALYSIS IN HOG

One of our hogs has lost the use of its hind parts, it lies down most of the time and moves about by dragging hind parts. The hogs are well housed and not highly fed. What can be done for this trouble?—T. B. S.

Paralysis of hind parts in hogs is quite common, especially those that are highly fed on corn and not allowed much exercise when they are getting fat. In this case I would suggest very light feed, a dose of from one to two ounces of epsom salts, and an arrangement so that he can be out of doors on fine days, and in warm house at night.

CAMPAIGN AGAINST ABORTION

The campaign against contagious abortion is on. The national dairy council, the United States department of agriculture, the state stations and dairymen's organizations are co-operating to fight this great scourge. Every individual must do his part. Write to your state experiment station to join in the systematic campaign against the disease.

Abortion is rapidly becoming the most destructive of all animal diseases. It is extremely contagious and difficult to trace. It may be brought into the herd by newly purchased animals use of an affected bull, or contact with affected animals in other ways. If your herd has escaped thus far practice every precaution as a preventive.

A cow that has a persistent cough is always regarded with suspicion, yet it is quite possible that she might not be tuberculous. For rheumatism give your cow twice a day in feed, a teaspoonful of salicylate of soda, and feed liberally with bran to keep the bowels open.

Trappers! Highest Prices Paid

YOUR money is mailed same day your raw furs are received at our warehouse. Absolutely fair grading guaranteed. By shipping us all your raw furs, especially wolf, you will receive the biggest profit on your whole winter's catch. Send us what you've got now—we need the skins, you need the money.

THE HORSE

EASY TO TRAIN COLTS TO BECOME USEFUL HORSES

My experience has been that there is only one right way and time to begin breaking a colt, and that is before it is weaned. From that time the colt should be handled all over each day, so that it will be as natural for it to have its feet handled to have harness thrown on, and to carry things on its back as it is for it to eat.

If this method were always carefully followed there would be few kickers. In this way it is easy to accustom the colt to being led about with halter and bridle and to going fearlessly up to automobiles, engines, and everything at which it would ordinarily become scared.

When introducing a colt to any strange object, I avoid everything that could startle it, as at such moments they attribute a blow, a jerk or anything that causes them the slightest pain to the strange object of which they are more or less afraid, and from which they are expecting injury. At such times it is very easy to spoil a colt so that it will always fear that particular object. I have led colts up to objects they dreaded when their hearts were pounding not unlike a well-muffled exhaust and when even a sparrow sailing over would cause them to be wild-eyed, crouching and trembling.

At such times they need to have the greatest possible confidence in the men handling them, and if these men are of the excitable loud-mouthed, or whip-flashing variety the colts will be made worse instead of better.

I never hurry at such times. I lead the colt as near the strange object as he will go without forcing. When he stops I let him think I want him to stop, and pet him and handle him. I do anything to make him feel easy and natural; at the same time I keep working a little bit closer to the object he fears.

This requires time and patience, but is well worth the trouble if well managed, and the more often this plan is employed the less trouble you will have in getting him up to the next thing he fears.

I never strike a colt when he is frightened. I do not jerk or yell at him. The excitable, noisy man can never become a good horseman unless he first learns to control himself at all times.

Nothing is easier than to spoil a colt. Take harnessing: the quietest colt can be made to fear harness by throwing it on him roughly or if anything about the harness hurts him. The really valuable, high-strung, nervous colt is quite likely to kick the harness off. Wouldn't you? Anyway, if you had never worn anything until you were about eighteen, or proportionately as old as the three-year-old colt.

High-strung colts are more sensitive to pain than the average man or boy, and can hardly be expected to have as clear an understanding of what is required of them.

The untrained three-year-old can only be compared to an eighteen-year-old boy who has never worn clothing, never learned to talk or to understand words, and knows absolutely nothing but to eat what is given him and wish for more—if you can imagine such a case.

That is why, in teaching colts to work, there is only one method that will apply to all, and that is to have them grow up accustomed to the feel of the collar and other harness, to the commands he must understand, and to the work he must do, just as the boy is taught his A, B, C, and to play at things he will work at later.

If a boy grew to manhood with doing a stroke of work—or play-work—it would be some job to break him in. Play-work is good for either. The colt should start with a few minutes in harness and nothing to draw, and work up to drawing something very light, as a log-cabin and so on, as he grows.

He should go between thills quite young, and become so familiar with them that he does not object when they are rattled or slap his sides. Later, attach holdbacks and traces and teach him to back, turn, and hold back.

I start with one or two commands and teach him to understand and obey them; then I add one by one until he has mastered all that will be needed. I have him become fearlessly familiar with all wagons and machines about which he will work.

In breaking older colts I use the same method. It is necessary to study each animal, giving due consideration to the temperament and habits of the strain to which he belongs, particularly of his dam and sire, so as to guard against inherited faults. This method, followed with intelligence and

Flattering to the Original

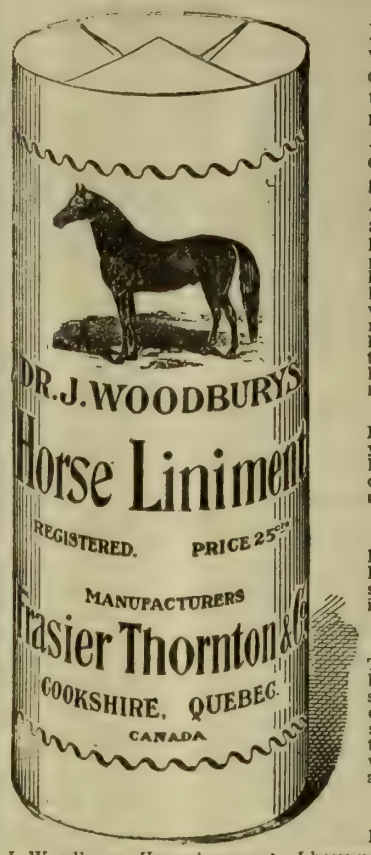
But Imitations Only Disappoint

There are many imitations of this great treatment for coughs, colds, croup, bronchitis and whooping cough. They usually have some sale on the merits of the original, but it should be remembered that they are like it in name only.

This is a facsimile of the package bearing portrait and signature

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.

Newton Lee, Owner "All Right" 5817.
Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

FRASIER THORNTON, & CO., Limited, Manufacturers: Cookshire, Quebec, Canada.

With few exceptions, bad horses are made bad by the methods used in breaking them. Usually such horses can be traced to men who will not make a study of each animal and modify methods to fit cases. Horses are like children. We must win their confidence to such a degree that they fear nothing when we are with them.

If a person permits a colt to grow up unmanageable and to develop bad traits he is not a horseman, and no amount of hints on handling horses will make one of him. It will be safer for him to turn the bad animal over to a real horseman, not a loud-voiced brag, as horsemen, like musicians, are born, not made. E. A. W.

MARE SUFFERING FROM TOOTHACHE

I have a four year old mare that had distemper last spring. Ever since she has been in poor condition. I am feeding her on oats and hay. She seems to have difficulty in drinking. D. O.

Ans.—We have answered, during the last two weeks, quite a number of similar questions in regard to horses, showing the same symptoms you describe. Evidently your mare is suffering from toothache and you should have hre mouth examined by a vet and he will likely have to extract the offending ones. Tooth trouble is common at your mare's age, and too little regard or care is generally meted out to the dumb animal at this stage.

The star trotter and show horse of the Maritime Provinces in 1915 and 1916, Mayor Todd 2.15½, owned by Hammond Kelly, Charlottetown, has

WHEEZY COUGH and ASTHMA

Cured by

VENO'S LIGHTNING COUGH CURE

It is quite wonderful how Veno's Lightning Cough Cure overcomes those wheezy coughs that are so troublesome. The reason is that Veno's loosens the phlegm which causes the cough, and so the sufferer gets relief at once. In Asthma also Veno's is of highest value. It gives tone and strength to the bronchial system, and helps nature to throw off the complaint. As it contains no dope, it may be taken freely during attacks. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

Farmer Office

POULTRY.

FITTING THE HENHOUSE UP FOR REAL PROFIT

The hens ought to have access to the entire floor of the house. Food hoppers and drinking vessels should rest on a table in the middle of the house, or on a platform that extends from the wall. If hoppers and fountains are are kept on the floor of the house the hens will soon pollute the food and water by scratching filth and litter into them.

When a platform or table is used to hold the hoppers and drinking vessels, it is an easy matter to arrange the nests under them—drawer fashion. The nests should be made to slide in and out. The back part of the drawer should be boarded up only sufficiently to hold the nesting material, leaving an opening for the hens to enter the nest. The advantages of such nests are: They take up no floor space, being under the table they are dark, and hens prefer darkened nests. They can be removed and taken out of the building for cleaning and disinfecting and the eggs are easily gathered.

Nests should never be located on the floor of the house for the reasons that they take up necessary floor-space, soon become fouled and induce the egg-eating habit. If nests are nailed to the wall, they should be provided with sloping covers, so the hens cannot roost on them at night.

Dropping-boards should be installed in all poultry houses. Dropping boards consist of a platform, a foot or so under the perches. The use of dropping-boards is to save manuse and to keep the house in a sanitary condition. The house is kept in a good sanitary condition, however, only when the boards are cleaned as often as they should be. If one cannot clean the boards at least every other day, it would be better not to have them. Hens must have fresh air, and an accumulation of poultry manure immediately under the perches will greatly debilitate the flock. The manure on the boards will also breed lice and disease germs, and will keep the air of the house damp, and thus cause colds, catarrh and roup.

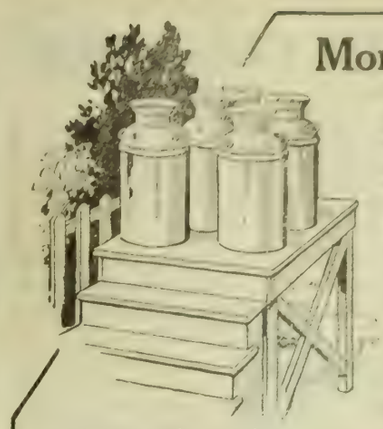
The perches ought to be at least two inches wide, so the hen will not have to cramp her toes to hold on. A popular way of arranging perches is to have them one above another—step-fashion. This arrangement is a very poor one. When such perches are used, the hens will fight for the high places, resulting in much confusion, display of temper and some falls. The perches should be arranged on a level.

Provision should be made for a dusting place for the hens. This can be done by boarding off a sunshiny corner and using the space so provided as a dusting place. If the floor is a dirt one, it will only be necessary to keep the soil well spaded and pulverized. If, however, the floor is of boards or concrete, it will be necessary to provide dusting material. Road dust is good. If a supply of this cannot be obtained, finely sifted coal-ashes will do as well. Wood-ashes should not be used in the dust-bath for the reason that the lime they contain will take the gloss from the hen's feathers.

The entire poultry-house floor, with the exception of the dusting place, should be kept bedded with litter. Exercise is essential to a good egg-yield, and unless the hens are forced to work hard for the greater part of their grain ration they will likely become lazy and fat.

T. Z. RICHEY.

To fatten poultry put them into a



More or Fuller Cans

Those who use Royal Purple Stock Specific secure from 3 to 5 pounds more milk from each cow per day. Figure the increase on even a small herd. It will pay you to feed Royal Purple to your cows, and steers can be fattened a month earlier by its use.

Royal Purple Stock Specific

is a digester, tonic, an animal conditioner. It aids digestion and assimilation and enables stock to get the maximum amount of good from the food eaten. Greater gains are secured from less grain, and the cost of the Royal Purple fed isvery trifling. It will improve the condition of the worst, most run-down animal on your farm. If you have a poor, miserable, run-down, hide-bound horse in your possession, try it on him first and be convinced.

Royal Purple Stock Specific is put up in 50c. packages and $1.50 and $5.00 tins.

FREE BOOK

Write for FREE 80-page booklet on the common diseases of stock and poultry and our other products. It tells how to raise calves without milk, also how to build hen-houses.

Cases of Eggs Winter and Summer

Keep your fowl healthy, active and vigorous by feeding Royal Purple Poultry Specific in their mash, once daily, and you will certainly get eggs, winter and summer.

Mrs. W. Jackson, Saskatoon, writes: "Gentlemen,—I tried feeding your Royal Purple Poultry Specific last winter. I had fresh eggs all the time. Sold eggs from January to the 1st of March, and I know it was the Specific did it, and the hens looked healthy after using it. I started feeding them again this fall, and got eggs in less than a week."

Royal Purple Poultry Specific

Manufactured from roots, herbs, minerals, etc., is a complete substitute for the grasses, seeds, herbs and insects the hen picks up during the summer, necessary in making hens lay. Royal Purple Poultry Specific tones up the whole system, keeps the stomach and bowels right—prevents diseases such as Cholera, Roup, Rheumatism, Typhoid and kindred diseases.

Mr. J. Brandon, Ayr, writes as follows: "Dear Sirs,—Kindly send me one of your booklets. We didn't have an egg all winter until we started using your Royal Purple Poultry Specific, and it is the best thing I have ever used. We are getting eleven to twelve eggs per day now on account of feeding them the right food."

Sold in 25 and 50c. packages and large $1.50 air-tight tins. Send for our FREE 80-page book on the common diseases of stock and poultry.

of seven parts corn meal, three parts middlings, and one part bran, with buttermilk enough to make a mixture about as thin as pancake batter. During the 10 or 14 days they are fed this ration they gain from 15 to 25% in weight and much more than that in flavor.

PICKING OUT THE BEST LAYING HENS

Picking out the hens that are actually laying from a flock of chickens is not a difficult task, accordinw to W. A. Lippincott, professor of poultry husbandry in the Kansas State Agricultural College. At or near the close of the laying season the shanks of the from the yellow shank goes into the eggs in the laying season, and the hens that have been laying well always have pale shanks. The same is true of the beak.

It is possible to tell whether or not a hen is laying at a given time by the relative position of the pelvic bones. If the two bones are close together, hard and not pliable, the hen is not laying. This is no indication, however, as to whether the hen is a good layer.

The laying hens have a decidedly feminine appearance—they show their sex plainly. Sex characteristics are likewise much in evidence in the breeding males—they are scrappers. The laying hen is the most active bird in the flock. She is the last on the perch at night and the first off in

ONE GOOD TURN

By May Wilmoth

Same had been dead three days. The bed he and Jimmy had shared at Mrs. Solomon's was relet.

Sam had failed Jimmy at last. He had obeyed the summons of the grim reaper with only one regret in his toil-burdened mind; that the little waif for whom he had cared from babyhood would be left homeless. Sam's fostering of Jimmy had been an attempt to square an account that was somewhat in arrears with the world.

Jimmy's father and mother were mythical beings, who had utterly vanished with the mists of babyhood. Sam had often assured the boy that he was the gainer by the loss, a paradozical statement that Jimmy was too young to understand or to trouble about.

Thus Fate, the wanton jade, juggled with an atom and decreed that Jimmy, with his tip-tilted Irish nose, his beautiful Irish blue eyes and brown hair that waved above a broad Hibernian brow should share the bed of Sam Epstein in the flat of Mrs. Solomon, widow.

For three days Jimmy had lived upon the charity of Mrs. Solomon. But now the plain deal coffin which held the body of his benefactor was removed, and Jimmy was told "to beat it."

"I got five kids," explained Mrs. Solomon, which would seem to be explanation enough. "You gotta find woik."

Jimmy obeyed with alacrity the order to vacate. He paused upon the stairs to dry his eyes, swallowing a lump in his throat very like one of Mrs. Solomon's dumplings. But he must find work, so tears and emotional lumps must both be ignored.

Now Jimmy was only ten and the law insists that children of that tender age shall be in school. But for two days Jimmy eluded the law, personified in the statuesque "copper" Mike Flanagan, and tried hard to find work.

If he only had a little money to invest in newspapers, or to buy that little bootblacking-outfit displayed in the window of the Orchard Street shop! Such were the boy's dreams as he begged at the saloons and restaurants and shops for employment, and was nonchalantly swept away from their doors.

The first night he began housekeeping in a good-sized dry-goods box. But a street-boy much bigger than he coveted the apartment, and Jimmy perforce must find another.

The third morning after his eviction from the Solomon rooms found Jimmy seated on the curb in Orchard Street in open defiance of the law. He knew, however, that policeman Mike was at the toher end of his beat and that he had a few moments to spare. His legs were cramped and stiff, as his dry-goods box of the previous night was very small. Also, he had remained there all the morning, until driven forth by scrunching twists of hunger in his little "tummy."

The sun beat down upon his bare head; the noisome stench of the street filled his nostrils; its strident blare roared in his ears. Above his head there loomed tenements flaunting a ragged array of bedclothing and underwear from iron fire-escapes. The crowd swarmed past, a jostling pandemonium.

But none of these dissonant elements disturbed Jimmy. He was accustomed to the noise and dirt; he liked the "feel" of the multitude about him; he knew nothing of the harmonies of life. But the pains in his stomach telegraphed disturbing messages to his legs and feet.

"Right around the corner," they clicked, "in Ikey Goldberg's bakery are heaps and heaps of crusty loaves and cookies, and there are alluring berry pies, and there are dandy frosted cakes."

However, Jimmy's eyes thoughtfully contemplated a garbage can. There are nuances of respectability even in Orchard Street.

By grace of Sam Epstein, Jimmy had been respectable. He had always had a bed and three meals a day. There had been fat days and lean days, but there had always been days. It seemed now that there was to be nothing henceforth but black night in which garbage cans and dry-goods boxes were to dance a mad saturnalia.

He eyed the can and thought of Ikey Goldberg's bakery. He had been told that it was wrong to steal, but he knew that it was right to eat. What penalty would be entailed by theft he did not know.

Law meant brass buttons and a benignant smile, these supplemented by a stout locust upon occasions. It meant that in some mysterious realm there were judges, courts, jails and other effete institutions. These things were to be shunned, Jimmy had been taught.

But he did know what the sufferings of hunger were like. Between the abstract wrong and the concrete right the boy was rapidly coming to a decision.

Then, with a feeble whoop of satisfaction at a settled problem, he sprang up and faded round the corner into Rivington Street.

He found a closer contemplation of the goodies in Goldberg's bakery fully as enticing as he had anticipated. He flattened his tip-tilted nose against the glass while he shuffled from ont foot to the other. His mouth slowly watered.

He longed for a hammer. With a rousing bang he could break the window, annex the good things and skip. Lacking the hammer, he sidled along the pave and slipped unostentatiously through the bakery-door.

Jimmy had been there before many times, but he had always entered with the confident air of one who holds in dear to the heart of a boy; pennies for cream puffs or cookies or an all-day sucker. Sam Epstein had never forgotten that somewhere in his own dim past there lay a lovely dreamland, the witching interval of boyhood. Thus, Jimmy had profited by Sam's memories.

But now the hangdog air of the penniless enveloped him. The aura of his fell intentions vibrated colorfully. Instinctively he knew that he must remain and depart unnoticed. He skulked behind the broad back of an auburn-haired Jewess, edging nearer the counter.

He glanced about cautiously, then peeped at the girl behind the counter. She had just turned to make change at the cash register. Jimmy's moment had come.

From the shelter of the sturdy Hebraic back two grimy paws shot out. A crusty loaf and a juicy berry pie disappeared as if by magic.

Jimmy clasped the loaf and pie to the exterior of his anatomy preliminary to its proper distribution within. But though he had looked before and about him he had failed to look behind him.

As he wheeled to dash to the door a lean, cruel, sinewy hand grasped his shirt-sleeve, and the tender flesh beneath it, and a thick voice smote his ear:

"You liddle villain, I vil sent you to jail!"

The final word inspired Jimmy to heroic action. Faint with hunger though he was, he wriggled and tore free. Ikey caught him again; he kicked and bit and ducked. The air was filled with lamentation, Ikey mourning for his bread and pie and Jimmy clamoring for his freedom.

There came a sharp rip and a generous part of the boy's shirt was left in the Hebrew's hands, while Jimmy dashed out. Goldberg wheeled in pursuit. Down the street dashed the youngster cissely followed by the irate Jew.

Jimmy turned the corner into Orchard Street. In his mad flight he upset toddling babies and mothers joined in the chase, vociferously protesting against such treatment of their offspring. Boys and girls, just let out of school, hitched on; vagrant curs leaper and barked joyfully; sharp gongs punctuated the din. A bell in the hands of a street vendor added its note to the general discord. The owner of the bell dropped his clanging instrument, and with articles of white wearing-apparel chastely draped about his person and bellying out behind, joined in the pursuit. In point of inspiration it was not unlike the first meet of the season at the Hunt Club. There was something small and timid to chase, and sporting blood was tingling.

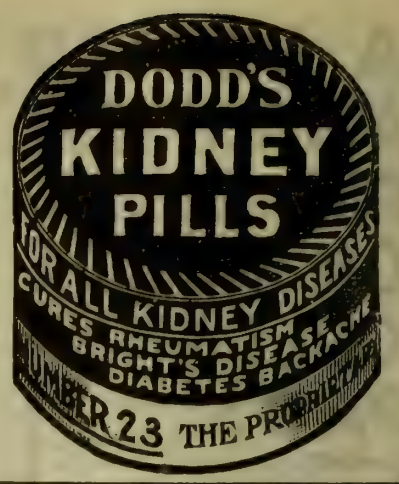
The quarry remained modestly in advance, spurred on by the vivid memory of Ikey's threat of "jail." In the beginning he left a condemning trail of circumstantial evidence in the shape of oozing berry pie spread upon the walk. For from the start he had clung to the pastry; now it clung to him. The bread, possessing less tenacity, had slipped from his arms into the street.

Panting, sweating, his little heart almost bursting, the boy dashed blindly on and plump into the grand person of Policeman Mike Flanagan. With the impact that Hibernian Hercules swore a round Celtic oath and clutched the youngstor by the shoulder.

Jimmy was surely caught "with the goods on;" in fact, very much on. So plastered and smeared was he that one might well wonder how Ikey was ever to identify his pie.

Mike gave Jimmy a vigorous shake.

"Sure, 'tis yerself, Jimmy Epstein? An' I'd niver ha' thought ut av a Irish Jew!" he commented as Gold-



"I ain't no Jew!" he yelled, truculently. "I'm as Irish as you are!" and he attested the natural aggressiveness of his race by administering to Mike an unsportsmanlike dig below the belt.

"Kape yer dirthy little paws out av me midriff or I'll brain ye wid de club!" said the policeman.

But with his last spasm of anger the boy, now dazed and scared, had mentally capitulated. The crowd cheered and jeered, but it and the gesticulating Jew and the big "copper" were lost in a mist. Jimmy's teeth chattered like the castanets of the little Spanish dancer in the dirty theater in Rivington Street.

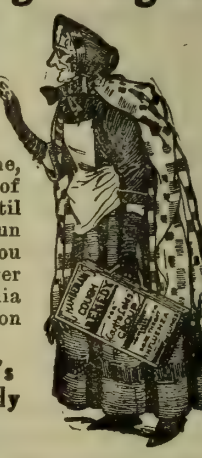
It would score one for morals to here record that Jimmy was at this moment overcome by the enormity of his sin. It must be admitted, with more or less of regret, however, that this was not so. He was overwhelmed by a greater calamity. His arms were empty ; the pie and bread were gone. The reviving virtues of the mess plastered so generously over his person had not entered his interior. He was still hungry.

And oh, how he wanted good Sam Epstein! How he wanted the hard bed they had shared together, and the indigestible messes of Mrs. Solomon's preparation! He wanted everything he had been missing these two woeful days, but paramount was the desire for Sam.

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations bladder weakness constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, lesire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box H, Windsor, Ont. Please send your photograph and signature.

Hacking Coughs



For hacking coughs —the kind that make your throat sore and your head ache, that rob you of your sleep until you are so run down that you are in danger of pneumonia or consumption —take

Chamberlain's Cough Remedy

It soothes and heals the inflamed air passages, stops the tickling in the throat, and by its tonic effects helps you to throw off the disease.

"Granny" Chamberlain

Chamberlain's is quite different from the ordinary cough medicine, for it not only soothes but also heals, restores the affected parts to a healthy condition. I believe it is the best and most reliable preparation ever produced for coughs and colds.

So now the grief which Jimmy had manfully suppressed found vent. His howls of despair rent the thick air of Orchard Street, and as hunger had not seriously impaired his crying the dingy thoroughfare was treated to a lachrymal sensation.

"Shut up, ye little divil;" commanded Mike, and clapped his hand over the culprit's mouth. Then he marched the youngster along by his side, the crowd following.

Through Orchard Street they trailed, this street which, like some ill-favored tramp, has so sadly belied the name bestowed upon it. But when they arrived at the Third Avenue entrance of the Child's Court the straggling procession was curtailed to the three principals.

Jimmy was hustled into a room at the side of the hall, and as a voluble melange of Yiddish and Irish American set forth his sins of commission he felt an ache in his left side. The man behind the desk glowered at him and the ache grew worse.

Nowhere was there a friendly face.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

Windsor, Ont.

There was nobody who could understand and extricate him from his childish difficulties; nobody to whom he could explain that the sufferings of hunger are more powerful than the fear of laws or judges or jails.

These men were not concerned with causes. Why should they be? They were paid for administering to effects. Jimmy was too young to work; he had been told so by the men to whom he had applied for it. However, it appeared that he was not too young to be starved and thrown upon the beach of society, a useless bit of wreckage.

"G'wan, take 'im right in to the judge, it's gettin' late," directed the man behind the desk. As Jimmy found himself descending narrow winding stairs, escorted by Mike, it began to seep through to his bewildered young mind that when you have once crossed the border line into the Bad Land you are due to receive very little consideration from those persons who are safely upon the other side.

He never quite knew how he got there, but presently he was standing before a big desk and Ikey Goldberg was raising a dirty paw and solemnly swearing in two languages "to tell the truth, the whole truth and nothin' but the truth." Then another freshet of mixed Yiddish and American was poured into the ears of the judge.

It is safe to say that never in the annals of the Child's Court had there entered its doors a more disreputable malcontent than Jimmy. His shirt was half torn off, his cap had been lost somewhere in the melee, and berry pie was fancifully stuccoed over him. But more serious than his sartorial disarray was the growing look of defiance that was settling over his small white face.

This Saturday was the last day of Judge Gray's three months' term in the Child's Court. For many reasons he was always glad when this task was at an end. Unlike many public servants, he found it quite impossible to deal with effects as presented to him by childish misdemeanors and was continually delving into causes. The questions of public conscience, private responsibilities and the whole brood of active impertinent interrogations tended to disturb his original optimistic belief that the trend toward ultimate good is sure.

The lower East Side shrieked aloud to him that misery, crime and disease stalked grimly everywhere for the undoing of the tiny atoms of humanity in whom should repose the wealth of the nation. He heard much fine rhetoric expended upon the conservation of natural resources, but very little scientific thought was given to the human lives for which these things were to be conserved.

A slight smile crossed Judge Gray's handsome face as he gazed down from his big chair into the pie-plastered face of Jimmy. He ignored the voluble Jew and addressed himself to the boy.

"What is your name, little man?"

The judge's voice was pleasant.

"Jimmy, sir," he faltered.

"Well, how old are you, Jimmy?"

"I'm ten, sir."

"What had you been doing that the officer should have found it necessary to bring you here? This is not a nice place for a little boy. Never mind what the man is saying; you tell me all about it. Keep still, my man," he added to Goldberg.

Jimmy heard the compassionate thrill in the judical voice; he saw a curiously tender look in the blue eyes regarding him through glistening lenses. The voice held the same note that Sam's voice used to hold for him, and the eyes held the same look that Sam's eyes had always held.

Then and there Jimmy forgot that the judge was there to punish wrongdoing. He forgot everything but his engulfing desire for comprehension and sympathy.

Breaking away from Policeman Mike's restraining hand, he flew like a small whirlwind around the side of the great desk. Straight to the judge he raced, and to the horror of the court spectators he precipitated himself nto the judical lap, hiding his dirty, tear-stained, frightened face against the lawgiver's breast.

Uniformed persons hastened forward to remove him. The judge waved them away. For the first time in the annals of any courtroom, crime explained itself while literally seated in the lap of justce.

"Mister," sobbed Jimmy, "Sam died, an' I didn't have no money, an' I couldn't find no work, an' I had an awful pain in my insides 'cause I hadn't had nothin' to eat in two days, an' I was awful hungry, an'—"

Jimmy faltered, then everything turned misty and faded quite away. There was a great roaring in his ears; then came darkness and silence.

When he opened his eyes he thought he had died and gone to heaven. He opened out his legs and arms, then drew a hand carefully out from under the covers. He held it up; it was clean! He gazed at the covers and sheets; clean, too! He passed a hand over his face that felt clean, and he was clad in a clean little nightshirt!

He glanced around the room. It was very small but sweet with the fragrance of roses. There was a large bouquet of them in a squatty vase upon the little table at the head of his bed.

At the opposite side of the room a door stood ajar. As the boy watched, still thinking of himself in heaven, the door swung noiselessly open and a little girl entered, clad all in shimmering white. He regarded her wonderingly as an angel; he had seen one like her once on a Christmas-card at the mission. But instead of the conventional harp, this more utilitarian angel bore in her hands a prosaic tray which she placed upon a table in the center of the room.

She approached the bed, and Jimmy's eyes flared into hers as she bent over him.

"Oh!" she cried, happily; "I'm so glad you're awake! Miss Granger is

coming in to give you some chicken broth and some chicken, too."

The boy thrust forth a thin brown hand.

"Ain't this heaven?" he questioned timidly. "You're an angel, ain't you?"

The little maid dimpled and shook her long golden curls.

"No, I'm not an angel. I have flare-ups. This isn't heaven. It's only Miss Granger's room. She's the Child's Court matron. I'm Judge Gray's little girl. I'm waiting for my papa."

Just then Miss Granger entered. She looked not at all matronly. She was of medium height, slender without thinness, and she possessed much fluffy golden-brown hair under which a piquant face looked out rather wistfully upon the world. Her colouring was creamy with delicate highlights of faint pomegranate in her cheeks.

Miss Granger was the only mitigating circumstance of Judge Gray's term in the Child's Court. When he looked across the big room and saw her, serious-eyed and sympathetic, taking charge of his poor, soiled little miscreants, the judical heart under the black robe would throb warmly, and the judical pulses would quicken their dignified rhythm. And these symptoms would produce a well defined primitive desire to carry this wildrose creature away to his uptown lair, and keep her there always, as a mother for Elsie, and a companion for his own lonely life.

This desire the judge had upon an occasion imparted to Miss Granger. But as her home was also uptown, and she had departed therefrom because of her desire to be in closer touch with the sore spots of the city, she had refused the judge's plea. Her heart, she told him, lay in the chosen work of helping humanity.

Miss Granger sat down beside Jimmy, while Elsie perched upon the bed and interestedly watched him absorb nourishing broth and delicate bits of chicken. He soon owned that he felt almost as good as new.

During the feast Jimmy gathered that after he had fainted the judge directed his removal by a policeman to the room he now occupied, and that they had found it difficult to force medicine and nourishment between his poor blue lips.

Just then came a knock at the door. At a nod from Miss Granger Elsie ran to open it.

"Daddy!" she cried, dancing up and down while her curls jigged merrily, "Jimmy is better; aren't you glad?"

"First names already?" he smiled, as she caught his hands and dragged him across the room to the bedside.

Judge Gray bent over the bed and took the boy's thin hand in his, and looked at Miss Granger. For some reason the faint banner in her cheeks turned to the deep red of the heart of the pomegranate.

"Well, Miss Granger," inquired the judicial visitor, "what are we going to do with this young man?"

"Until he is stronger I can occupy my sitting-room. I couldn't think of turning the poor little mite out."

The lawgiver laid the boy's hand gently upon the coverlet and walked around the foot of the bed, pausing by the girl's side.

"Your heart seems kind to all the world but me," he murmured very low, so that the children, who had entered into a conversation, could not hear.

"Don't!" The young woman's voice broke a little. "I do not mean to be unkind. But a woman must remain where her heart is."

The jurist's acknowledged controversial powers were stilled by the sweet reasonableness of the answer. A woman must naturally remain where her heart is, he mentally admitted, though the concession was accompanied with a deep regret that her affections could not have been slightly more concentrated.

(Continued next issue)

MISS' AND SMALL WOMAN'S DRESS.

By Anabel Worthington.

The practical application of fashion tendencies makes this a worthy design in a dress for misses and small women. It is more than passingly smart, yet designed after the manner of the gracefully simple frock that has so many followers.

The treatment of the waist fronts—extending in tab effect, crossing and buttoning at the waistline—is new and novel. Because a rather low V neck results from the surplice closing of the waist, a shield or vestee of lace, silk or other material is desirable for filling in below the line of the collar. The button decoration of the waist at this point is noticeably neat. The fulness of a long sleeve is drawn in at the wrist, where a band cuff of material finishes. The collar is of satin and the girdle or belt is of matching material.

The two gore gathered skirt has its attraction in being plaited at centre front with some panel suggestion. The modern maiden or small woman may have a delightfully smart dress made after this pattern in duvetyn, prunella cloth, checked serge or the like trimmed with black satin and at slight cost. Its development is the simplest of tasks.

The pattern of dress, No. 8,074, cuts in sizes 14 to 20 years. To make in size 16 requires 5⅛ yards of 36 inch material, ½ yard of 36 inch satin and ⅜ yard of 12 inch lace for vestee.

To obtain the pattern, send to the office of this publication.

LADY'S FOUR GORE SKIRT.

By Anabel Worthington.

The choice of the right style of skirt to wear with a favorite blouse will often give the effect of an attractive costume that one may wear to a matinee or lunch party with a sense of relief that she is following the mode. In the illustration is shown a garment that may grace such occasion if developed in one of the fashionable materials of the season.

If you like their dressy effect you will add the side peplums to the skirt; with them one may even transform a last year's model, but the style stays though they be omitted. The garment is cut in four gores, has left side front closing and full length panel front and back. To show Fashion's fancy, the skirt may be trimmed with braid, beading or fringe. The lower edge in size 24 waist measure requires 3⅝ yards.

Serge is good for wear with a wash silk waist for practical wear; duvetyn with a voile waist, broadcloth with a net or crêpe de Chine blouse, and there may be considered also for developing this design gabardine, satin, mohair and tweed. The illustrated instructions are so clear that you may be sure of an exact duplicate and you will have a smart looking and stylish skirt at a very small cost by being your own seamstress.

The pattern of skirt No. 8,091 cuts in sizes 24 to 30. To make in size 24 requires 4 yards of 44 inch material, allowing for peplums, and 4½ yards braid; 3⅝ yards 44 inch goods without peplums.

To obtain the pattern, send to the office of this publication.

ADDRESS OF MR. T. W. CALDWELL, PRESIDENT OF THE NEW BRUNSWICK POTATO GROWERS' ASSOCIATION AT THE ANNUAL CONVENTION AND POTATO SHOW HELD AT WOODSTOCK, DEC. 27TH AND 28TH, 1916.

Ladies and Gentlemen:—

As we, the potato growers of New Brunswick are assembled here in convention for the second time, it might be well for us to review some of the reasons why we are here to-day.

In the first place I think you will all agree with me that the potato crop is the most important crop raised in New Brunswick to-day. It is also a crop that we get more money per acre invested in the raising of, than any other crop we grow and it therefore behooves us to consider well the best methods of tillage, seed selection, fertilizing, cultivation, spraying, grading, and last, but not least, marketing this most important crop.

I feel that we have been fortunate in being able to secure speakers who can speak with authority on these different subjects, and I wish to impress upon you the fact that you cannot afford to miss any of the sessions of this convention.

Before I go any further, I think it would not be amiss for me to say that I feel that we, the potato growers of New Brunswick, owe a debt of gratitude, aye, more than gratitude, to Professor G. C. Cunningham the Dominion Plant Pathologist for New Brunswick, who was instrumental in calling the Potato Growers' Convention which met here in March last, who was the prime mover in forming the New Brunswick Potato Growers' Association and who, as Secretary of this Association has been so indefatigable in his efforts to assist the potato growers of this Province. I also feel that we are to be congratulated on having such an eminent authority on plant diseases as Professor Cunningham to co-operate with us in this most important work.

And right here let me say that the New Brunswick Potato Growers' Association was not formed for the purpose of trying to induce the farmers of New Brunswick to plant more potatoes. I will read from the constitution and bye-laws, the clauses which set forth the aims of the Association, so that there may be no misunderstanding with regard to this matter:—

CONSTITUTION AND BYE-LAWS

Article I. Name.

The name of this organization shall be "The New Brunswick Potato Growers' Association."

Article 2. Object.

This Association has been organized to promote the interests of the potato industry in the Province of New Brunswick. It shall be the object of the Association to assist in the dissemination of knowledge on methods of cultivation, suitable varieties, seed improvement, grading and standardizing, marketing, eradicating and controlling fungus and insect diseases, and other allied subjects.

(1) By collecting and disseminating the best available information relating to both the practical and scientific phases involved, in increased yields, coupled with a lessened cost.

(2) By encouraging proper cultural practices in relation to the maintenance of soil fertility through the proper use of fertilizers and by promoting the introduction of modern potato machinery.

(3) By encouraging the cultivation of pure varieties of potatoes for all commercial purposes.

(4) By giving special attention to seed improvement, to the dissemination of standard commercial varieties and by encouraging the elimination of undesirable commercial types.

(5) By encouraging the community plan of raising desirable varieties, (one or two varieties to a community).

(6) By encouraging the grading, standardizing and certification of table and seed potatoes.

(7) By investigating the demands of all available markets and assisting New Brunswick growers to meet such markets.

(8) By assisting in controlling and eliminating fungus and insect pests, and in preventing the introduction of new diseases.

(9) By investigating methods for the profitable utilization of surplus and cull potatoes.

With regard to the work the Association has been able to accomplish during the summer:—

There were test plots of potatoes planted at Grand Falls, Andover, Florenceville, Centreville, Hartland, Woodstock, Keswick, Fredericton Junction, Chatham and there was also a test plot of New Brunswick potatoes planted at Kentville, N. S. In these ten test seed plots were planted 114 different samples of Green Mountains and 37 of Irish Cobblers, the results of which we will give you later and which I believe will demonstrate the fact that there is more in the matter of seed selection than the ordinary potato grower has any idea of.

We also did considerable field inspection during the summer and are following that up with a cellar inspection of the same lots that were inspected in the field, so as to be able to put in touch with those who wish to secure pure seed, those who have it.

Before I sit down I wish in the name of the Potato Growers' Association to

Always the Same

"Beaver" Flour is as uniform in quality as a minted five dollar gold piece.

Its proportions are as accurately fixed, and as scientifically determined.

The wheats used in milling "Beaver" Flour are analyzed—and the percentages of gluten, starch etc. are found by chemical tests.

We know—

from years and years of experience—just how much western spring wheat to add to the choicest Ontario winter wheat—to obtain the desired strength.

BEAVER FLOUR

Equally good for Bread and Pastry. *Milled of Blended Wheat.*

This is why "Beaver" Flour always gives good results—why it requires less shortening—why everything you make with it has a flavour that you cannot get with western spring wheat flours. Try "Beaver" Flour yourself for both Pastry and Bread—you'll find it equally good for either, and best for both. Remember, to insist on having "Beaver" Flour—the original blended wheat flour.

DEALERS—write for prices on Feed, Coarse Grains and Cereals.

THE T. H. TAYLOR CO. LIMITED, - - CHATHAM, Ont. 201

When The Children Rush In From School,

and shout for "something to eat", cut off generous slices of bread and spread with

CROWN BRAND CORN SYRUP

"Twill be the children's daily treat. So good for them, too—wonderfully nourishing, to build up their little bodies and help to keep them well and strong, as wholesome food should.

The most delicious of table syrups for Griddle Cakes, Waffles and Hot Biscuits. Excellent for Cake and especially for Candy making.

In 2, 5, 10 and 20 pound tins—and 3 pound "Perfect Seal" Glass Jars. At all grocers. Our new recipe book, "Desserts and Candies" shows the new and right way to make a lot of good things. Write for a copy to our Montreal Office. It's free.

THE CANADA STARCH CO. LIMITED

MONTREAL, CARDINAL, BRANTFORD, FORT WILLIAM.

226

thank the New Brunswick Potato Shippers' Exchange for their very generous donation of $300.00 for prizes for the potato exhibit which we are holding n connection with this convention, and also for their offer of $200.00 more for prizes n the field crop competition which we expect to conduct next summer.

Regarding the potato show which as I have said we have been able to put on largely through the generosity of the potato shippers exchange:—Owing to the fact that this Association is only yet in its infancy, and that a large number of the potato growers of New Brunswick have not had an opportunity to join the Association, we have not limited this show to the members of the Association, but have made it free to anyone in New Brunswick who grows potatoes, but I believe that in time to come our potato shows and field crop competitions, conducted under the management of the Potato Growers' Association, should be open only to the members of this Association.

Now, this may look a bit narrow at first sight, but I do not believe it is as I consider it is to the interest of every man in New Brunswick who grows potatoes, to join this Association, for by so doing he will not only help along the work the Association is endeavoring to do, but he will also put himself in a position to reap the benefits of the work being done by this Association, and as the membership fee is only $1.00, it is not beyond the reach of any. I hope every man who attends this Convention will see his way clear to have his name put on the membership list and hand his dollar to the Treasurer.

There is one thing more I would like to say regarding the Potato Show.

You will notice on your programmes that the Dominion Experimental Farm at Fredericton is exhibiting 60 different varieties of potatoes at this show, and also, samples of potatoes for distribution by the Dominion Experimental Farms are on exhibition. Neither of these lots will compete for any of the prizes offered at this potato show.

While the Government is not putting up any of the prize money, nor has anything to do with the management of this Association, nor would there be anything to legally debar them, yet the Government nor their Experimental Farms never compete for any of the prizes offered at any of the agricultural exhibitions or field crop competitions; these exhibits are put on by them as an educational feature of the show.

And just here let me say that I do not believe that we as farmers are availing ourselves as we should of the opportunity to obtain the information which the Experimental Farms are in a position to give us on our different farm problems.

They are now sending out application blanks and asking the farmers to fill them in and return them, asking for the publications dealing with the particular subject that they are interested in. This is an opportunity that I feel we should not neglect.

With reference to the field crop competition of potatoes which the Association will conduct next summer:—We have not got the details of this worked out yet, but as it will be some time before this will come off, there will be ample notice given. In this connection I wish to thank the different commercial agencies who have so generously offered to put up their money for prizes for this competition. The names of the different commercial agencies and the amounts are as follows:—

The Colonial Fertilizer Co., Windsor, N. S. $100.00.

The Dominion Fertilizer Co., St. Stephen, N. B. $100.00.

The American Agricultural Chemical Co., Boston, Mass., U. S. A. $100.00.

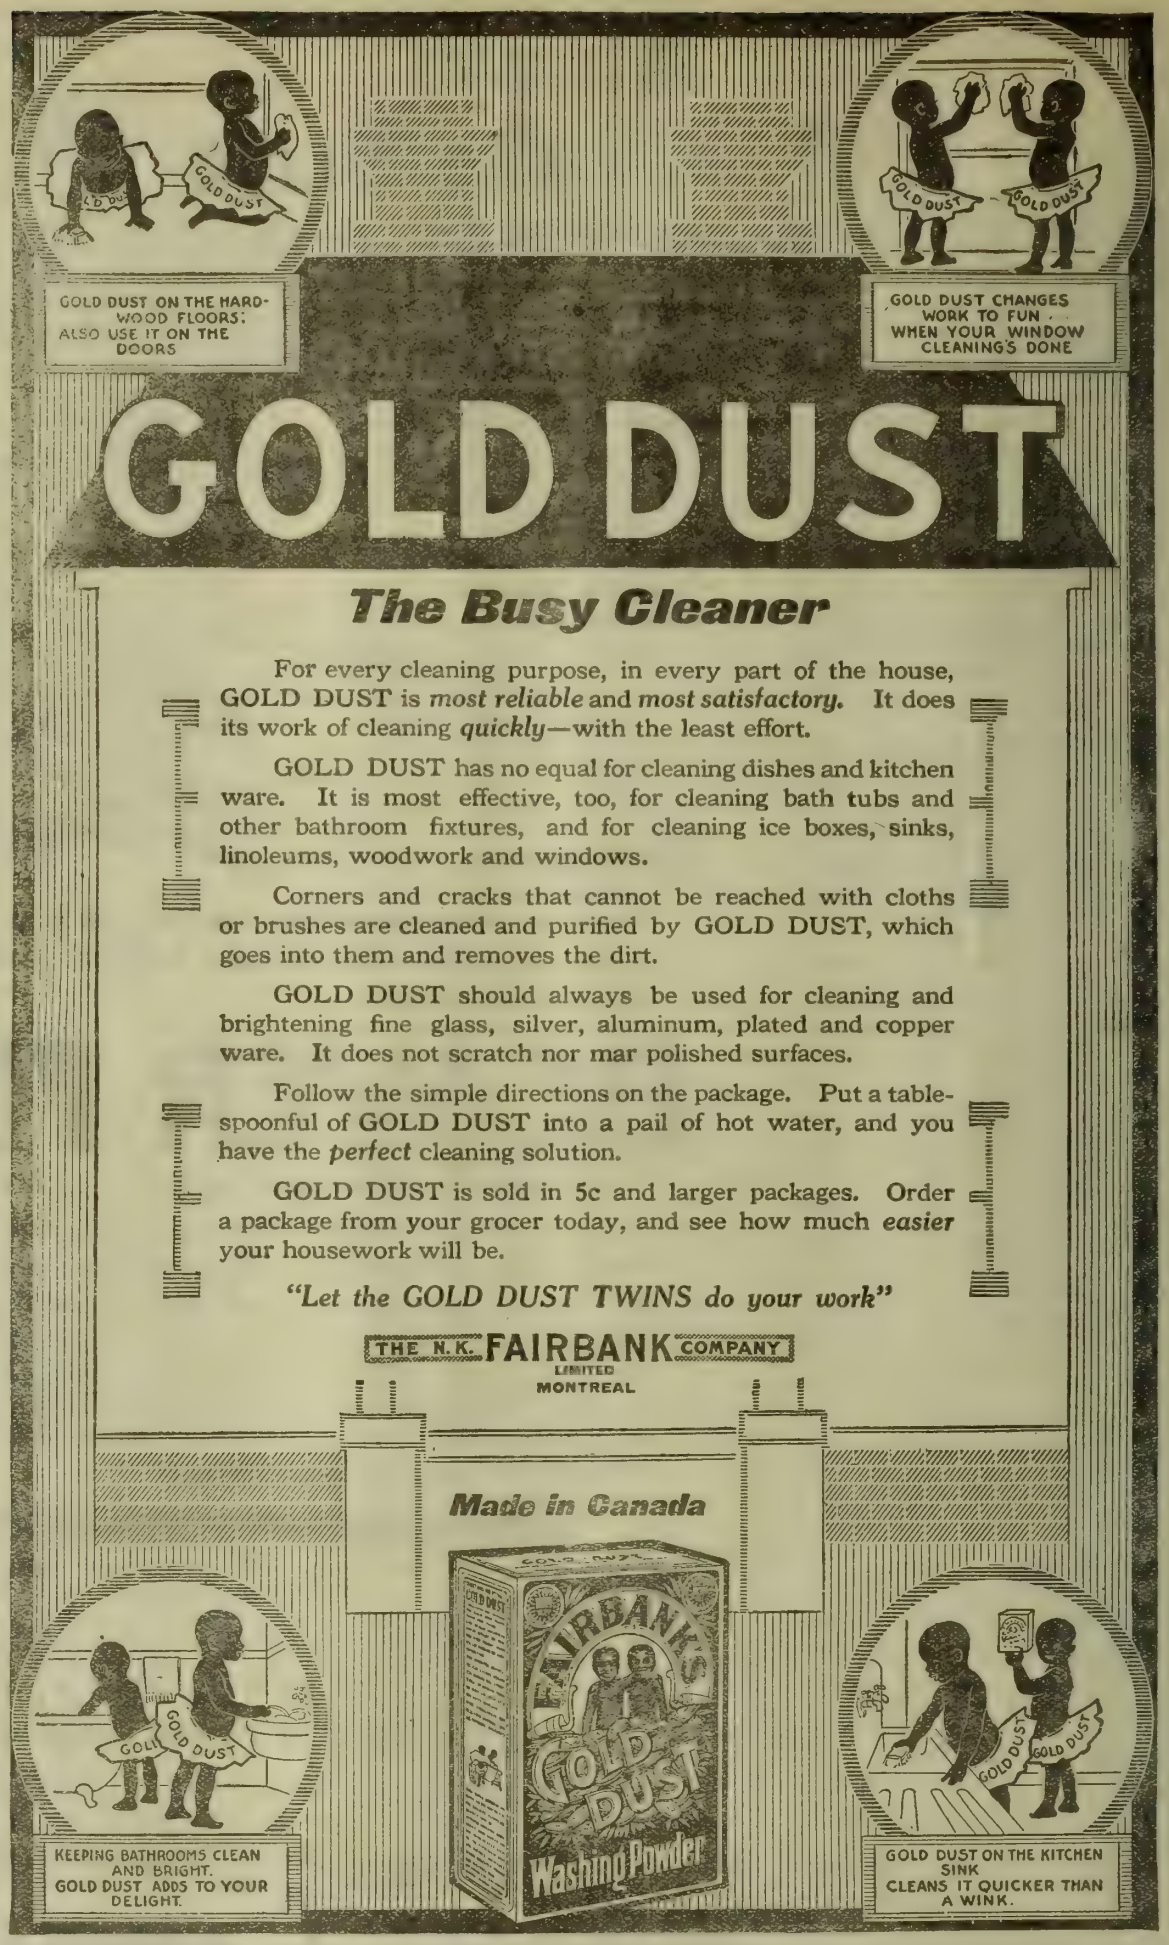
and I have no doubt that the other commercial agencies doing business in New Brunswick will be only too glad to contribute something towards making this field crop competition a success

---

Press comments continue to come to hand which indicate that the New Brunswick Department of Agriculture made no mistake in obtaining the services of Prof. J. W. Mitchell. The Manitoba correspondent for "Hoard's Dairyman," an influential agricultural journal published in the United States, makes the following statement concering Professor Mitchell:

"The retirement of Professor Mitchell from the position of Superintendent of dairying for the province of Manitoba is very discouraging to the dairy industry of the province. A survey of the development of this industry during the tenure of his office indicates somewhat of his ability, but what indicates most emphatically that he should not be lost is the remarkable improvement in the quality of the dairy products of the province of Manitoba and their gaining popularity in outside markets, and also that he has earned the enmity of unscrupulous milk and cream shippers through his endeavor to enforce the provincial act referring to shipping of milk and cream, and in his endeavor to improve the quality of dairy products."

About the time this issue is off the press the Nova Scotia Farmers' Association is opening its twenty-first annual convention in Amherst. We trust you are planning to attend. A full report will appear in our next issue.



GOLD DUST ON THE HARD-WOOD FLOORS; ALSO USE IT ON THE DOORS
GOLD DUST CHANGES WORK TO FUN WHEN YOUR WINDOW CLEANING'S DONE
GOLD DUST
The Busy Cleaner
For every cleaning purpose, in every part of the house, GOLD DUST is most reliable and most satisfactory. It does its work of cleaning quickly—with the least effort.
GOLD DUST has no equal for cleaning dishes and kitchen ware. It is most effective, too, for cleaning bath tubs and other bathroom fixtures, and for cleaning ice boxes, sinks, linoleums, woodwork and windows.
Corners and cracks that cannot be reached with cloths or brushes are cleaned and purified by GOLD DUST, which goes into them and removes the dirt.
GOLD DUST should always be used for cleaning and brightening fine glass, silver, aluminum, plated and copper ware. It does not scratch nor mar polished surfaces.
Follow the simple directions on the package. Put a tablespoonful of GOLD DUST into a pail of hot water, and you have the perfect cleaning solution.
GOLD DUST is sold in 5c and larger packages. Order a package from your grocer today, and see how much easier your housework will be.

TEACHER'S WINTER SHORT COURSE IN NATURE STUDY AND ELEMENTARY AGRICULTURE

During the week Jan. 8th-13th, the N. B. Department of Agriculture, through the Division of Elementary Agricultural Education, conducted courses at two schools for the purpose of aiding the rural school teachers to intelligently interpret and teach the perscribed nature study course for the province. These courses were held in the two agricultural schools of the province, one at the Fisher Vocational School, Woodstock and the other at the Agricultural School, Sussex. Both of these buildings are thoroughly equipped for modern agricultural instruction and the staff of instructors at each school was made up of agricultural men who were acquainted with the needs of the province along the line of more practical training in the rural schools.

The Department of Education cooperated with the Department of Agriculture and made it possible for rural school teachers to attend these courses without losing part of their grant for the terms work. This coupled with the fact that the teacher's transportation charges were paid by the Department of Agriculture, made it very easy for rural teachers to attend one or the other of these schools.

A total of one hundred and twenty-one school teachers registered at Sussex and Woodstock. Thirteen out of the fifteen counties of the province were represented. These teachers for the greater part, came from rural schools and came because they desired help in their nature study teaching. Classes in Methods of Teaching, Horticulture, Nature Study, Seeds, Soils and Agricultural Chemistry, provided ample instruction on all phases of the perscribed course. Each instructor had as his aim the teaching of the "nature study spirit" and the method of "learning through doing" and while a week is a short time in which to accomplish any lasting results, it is surprising the amount of new spirit which these teachers take back to their schools at the first of their winter course.

It is hoped that these winter courses will be a means of introducing to the teacher the great educational possibilities which lie in the school garden and the great out-of-doors about them.

SHORT COURSES AT SUSSEX

We have just received a copy of the proposed programme for the Farmers' Short Course at the Agricultural School, Sussex, N. B., on February 5th to 9th. It reads as follows:—

Monday, February 5th—3.00-3.50, Roots and Corn, O. C. Hicks; 4.00-4.50, Summer Feeding of Dairy Cows, W. W. Hubbard; 7.30, Chairman, Mayor McKenna. Addresses by Hon. J. A. Murray, Minister of Agriculture, Prof. M. Cumming, Principal, Nova Scotia Agricultural College, Truro.

Tuesday, February 6th—9.00-9.50, Cow Testing and Breeding, H. N. Flewelling; 10.00-10.50, Breeding Dairy Cows, Rearing the Calf and Training the Heifer, W. W. Baird; 1.30-3.00, Judging Swine, W. W. Baird; 3.00-4.30, Cereals and Seed Judging, O. C. Hicks.

Wednesday, Feebruary 7th—9.00-9.50, Swine Feeding and Breeding, W. W. Baird; 10.00-10.50, Care of Milk and Cream, J. W. Mitchell; 11.00-12.00, Development of the Sheep Industry, W. W. Baird; 1.30-3.00, Judging Dairy Cows, W. W. Hubbard; 3.00-4.30, Poultry,—Fattening and Killing, Seth Jones.

Thursday, February 8th—9.00-9.50, Crop Rotation, W. W. Hubbard; 10.00-10.50, Clovers and Grains, O. C. Hicks; 11.00-12.00, Creaming of Milk and Operation of Cream Separators, Dairy Staff; 2.00-3.30, Butter-making on the Farm and Demonstration in Butter-making, Dairy Staff; 3.00-4.30, Potato Growing, G. G. Cunningham; 7.30, Beef Production. Illustrated by Lantern Slides, W. W. Hubbard. Horticulture. Apple Growing. Illustrated by Lantern Slides, A. G. Turney.

Friday, February 9th—9.00-9.55, Horticulture. Apple Growing. Illustrated by Lantern Slides, A. G. Turney; 10.00-10.55, Manures and Fertilizers, H. B. Durost; 11.00-12.00, Potato Diseases, G. C. Cunningham; 1.30-3.00, Breeding. Care and Feeding or Egg Production, Seth Jones.

The only expenses you will incur are for board and your Railway Fare at reduced rate. Purchase a single First-class Ticket and secure a Standard Certificate from the Ticket Agent.

Railway Fares amounting to $2.00 or over will be refunded by the Department of Agriculture.

Ladies are cordially invited to attend lectures and take any portion of the course in which they are interested.

Make it a point to attend the course throughout, if at all possible. If you cannot do this, do the next best thing, attend as much as you possibly can.

Cheese and Butter Makers' Course

A short Course for Cheese-makers and Creamery Butter-makers will open at the Provincial Dairy School, Sussex, on Monday, February 12th, and close on Wednesday, February 21st.

A conference of makers and officers of factories will be held at the school on Tuesday and Wednesday, February 20th and 21st.

It will pay you well to attend these courses. Send the boys and girls.

The Three Functions of the Liver

1. It manufactures the bile essential in the process of digestion.
2. The starch and sugars derived from the food are stored in the liver and sent to the tissues as needed.
3. It detects and destroys poisons.

Dire Results of Overeating

From the standpoint of health man's cardinal sin is overeating.

The digestive system can look after a certain amount of food, but when continually crowded the food mass is delayed in the ailmentary canal and what is not digested ferments.

In other words, this food spoils or rots, and poisonous bacteria are given off.

It is the duty of the liver to destroy these poisons. It usually succeeds, but after a time it tires, increases in size from overwork, and finally fails.

What Failure of the Liver Means

The poisons then hurry through the liver and into other organs or tissues.

Then you have torpid liver, indigestion, headaches, bad breath, bilious spells and irregular action of the bowels.

This condition is described as auto-intoxication, or self-poisoning by food.

Cirrhosis of the liver follows. Complications set in. Bright's disease, hardening of the arteries, apoplexy are natural developments.

But these conditions do not come on you suddenly. You have months or years of warning.

How to Get the Liver Right

The thing to do is to keep the liver active and the bowels regular by use of such treatment as Dr. Chase's Kidney-Liver Pills, and you will then run no risk of such serious developments.

This medicine acts directly and specifically on the liver. By promptly awakening the sluggish action of this all-important organ a good flow of bile is ensured. This is poured into the intestines, where it acts as Nature's cathartic in keeping the bowels regular.

Prevent Host of Ills

Such a multitude of ills arise from sluggish action of the liver, kidneys and bowels that Dr. Chase's Kidney-Liver Pills are considered a household necessity wherever their merits are known.

By all means regulate your diet to your needs.

Then remember that when your liver does get wrong and threatens to upset the whole digestive system Dr. Chase's Kidney-Liver Pills will afford quick relief and prevent all serious complications.

One pill a dose. 25 cents a box.

Dr. A. W. Chase's Kidney-Liver Pills

LAST CALL TO THE NEW BRUNSWICK FARMERS' AND DAIRYMEN'S ASSOCIATION

The annual meeting of the New Brunswick Farmers' and Dairymen's Association will be held in the city of Fredericton on January 29th to February 2nd.

Every farmer in New Brunswick should be interested in this Annual Meeting.

This year the programme embraces subjects of vital importance and interest to New Brunswick farmers; and some of Canada's leading agrciulturists will be on hand to lead in the discussions on Dairying, Swine, Sheep and Poultry Raising; Cattle and Horses, Potato and Root Growing.

Wednesday is "Seed Fair Day" and a profitable discussion on the importance of good seed will occupy the morning and afternoon sessions.

The Normal School Gymnasium, where the Fair will be held, is splendidly suited for the purpose, being always heated, well lighted and roomy.

Prize Lists have already been sent out by the Department of Agriculture, and there is no reason why this should not be the biggest Seed Fair ever held in New Brunswick. I would urge all farmers to send a sample bushel of something.—TRY IT THIS YEAR.

Friday will be spent at the Experimental Farm where demonstrations and lectures will be given on Horses, Cattle, Etc.

Plan to spend the week in Fredericton and thus help—by your attendance and assistance in the discussions—to make this the biggest, most enthusiastic and most profitable meeting ever held.

The Executive would like to see 1000 members! Will you assist by securing two or three new members in your neighborhood?

PUT UP YOUR OWN ICE

An easily available watter supply and a little ingenuity are the requirements for producing ice on farms at small cost, according to Dr. J. D. Walters, professor of architecture in the Kansas Agricultural College.

"The ice making apparatus is simple and may be procured for a small sum," says Doctor Walters. "Tanks for freezing ice are usually made of galvanized iron, and should be large enough to hold at least 12½ cubic feet of water.

"An ice cake weighing about 120 pounds measures approximately 10 by 18 by 20 inches. This is a well proportioned cake, and one that is easily handled and packed. By using a tank with a capacity of 12½ cubic feet, it is possible to freeze six cakes of these dimensions at one time. If more ice is required it is but a matter of extending the freezing process to supply the demand.

"Two tanks are arranged, one inside the other, in such a manner as to leave a free space of about one-half inch between the two. Both tanks should be slightly larger at the top than at the bottom, so that in the freezing of the water, there will be no danger of their bursting. In order to make a division in the ice cakes, the inner tank is divided into six compartments by galvanized iron strips.

"This double tank is placed near the well or spring, where the compartments can be easily filled with water. In cold weather the water will freeze in a few hours, since the tanks are exposed on all sides. This ice should be dumped immediately after it is frozen solid. To remove the ice cakes, warm water is poured into the narrow space between the two tanks. Within a minute the sides will be sufficiently loosened so that upon the upsetting of the receptacle, the cakes will slide out.

"Fourteen freezings will make more than five tons of pure, clean ice, or enough to last an ordinary family a year. This estimate allows for an average daily consumption of 20 pounds, winter and summer, and also a liberal amount for melting. Figured at sixty cents a hundred pounds, this will represent a value of $60. The tanks and the necessary ice closet that has to be provided in the corner of the cellar, together with a load of sawdust or straw for packing, should cost considerably less than this sum." —Cold.

Refreshing Tea

In any season—Summer or Winter—there is nothing more enjoyable than a delicious cup of tea. The flavor must be *"just right,"* though, and that's where KING COLE TEA excels.

"You'll like the flavor"

THE DANGEROUS BARN LANTERN

Many farmers now have the convenience of carbide and electric lighting systems but there are still many of us who are compelled to do our chores morning and evening, during the winter, by the light of the barn lantern. But there is considerable danger of carelessness and consequent fire from the use of lanterns. Quite frequently we hear that Mr. A's barn burned last night because a lantern tipped over and caught in the hay. It stands us in hand to be careful and safeguard as far as possible for, "an ounce of prevention is worth a pound of cure."

In the stable a wire may be stretched with hooks fastened upon it and the lantern hung up out of the way. A nail driven into a joist answers the purpose, while in other places a bracket made from a piece of No. 8 or 9 wire is more convenient. Much danger is accompanied by taking a lantern into a hay lofe and then setting it on a beam or upon the hay. Better have a hook and hang it up. A small awning pulley fastened to a rafter and a clothesline run through it may be used in some cases to hoist a lantern to the peak of the barn, thus lighting the entire loft. However, it is held that there is much less danger from a lantern that is hanging up so it is time well spent to put a hook, bracket or nail wherever needed for the lantern.

THE ANCESTRY OF THE GOOSE

The ordinary breeds of demesticated geese are the slightly modified descendants of the grey lag goose (Anser anser L.) which is still found wild throughout northern Asia, although nearly extinct in Europe. It had already been domesticated at the most remote period of civilization. There appears to be in Anser anser and its tame descendants, as well as in the Chinese species (Cygnopsis cygnoides), a strong tendency to the production of white mutants and from these the white variety of both species has been created. As a rule, the changes due to domestication (waddling walk, lessened ability to fly and deeper rump) are those that would naturally be produced by selection of specimens possessing the best marketable form

The American Standard of Perfection recognises the following breeds

A MESSAGE TO WOMEN!!

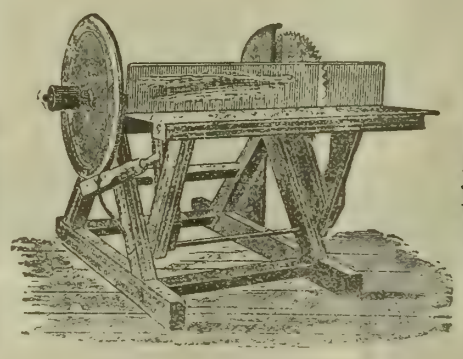
LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire palpitation, hot flashes, dar under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

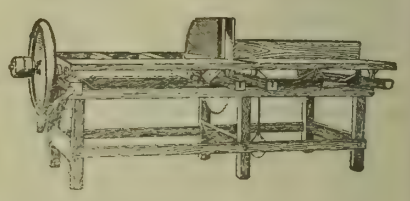
Sussex Wood Cutters Cut Expenses

Consult Our Quality Line Before Buying



Short Swing Wood Cutter

Wood Cutter Saws guaranteed at the right price. All sizes. Prompt delivery.



Flat Roller Table.

CONVENIENCE ECONOMY DURABILITY

are the three money-making qualities embodied in our Wood Cutting Machines. No frail parts to give out in a season's use. Built to last a life time. Frame is made of well seasoned birch, bolted and mortised; table of heavy steel plating in one piece.

Swing Table Machines built on skids, bearings supplied with compression greese cups. Especially adapted for use with gasoline engines. Made in four styles—Long Swing, Long Swing Improved, Short Swing, Flat Table.

Ask for our Catalogue and Prices, it will pay you.

Remember we also manufacture Trenholm Gear Hay Presses, Grain Grinders, Root Pulpers, Feed Boilers, etc.

What They Did For One Family

DODD'S KIDNEY PILLS CURED WHERE DOCTORS FAILED

Mr. and Mrs. Sawyer, After Years of Suffering, Found the Remedy They Sought in Dodd's Kidney Pills.

Capreol, Ont. Special.)—Firm believers in Dodd's Kidney Pills are Mr. and Mrs. Adolphe Sawyer, of this place. They have their reasons and are quite willing to make them public.

"I was a complete wreck when I started to take Dodd's Kidney Pills," Mr. Sawyer says. "I had suffered for ten years. I tried five doctors altogether. Some said it was rheumatism. Others called it lumbago, but none could give me any permanent relief. Dodd's Kidney Pills made a new man of me.

"My wife got the same good results from them. She also had been to several doctors. A specialist from Sault Ste. Marie advised her to stay in bed for a month. But she tried Dodd's Kidney Pills instead with splendid results.

"Do you wonder that we both praise Dodd's Kidney Pills? No one can speak too highly of them."

Dodd's Kidney Pills are purely and simply a kidney remedy. If the disease is of the kidneys or from the kidneys they will cure it.

90-Acre Farm, $1,300

Stock, Tools, Stock Included

Widower sacrifices his desirable, profitable farm near large R. R. town; shoe shop, creamery, canning factories, etc., house of 5 rooms; good barn for 6 cows; large poultry house; splendid trout brook; mail delivered, telephone; several hundred cords wood can be sold at $5 cord with only 2 mile haul; smooth, machine-worked fields for potatoes, and 5 acres potatoes nearby sold for $1,300 last year. Owner has lost wife and makes low price $1,300, part down. If taken now he throws in 4 heifers, cow, hens, hay, potatoes, vegetables, wagon, harnesses, machinery and tools For travelling instructions see page 3, "Peace and Plenty Catalogues," copy mailed free.—E. of geese: Toulouse (gray), Embden (white), African (gray), Chinese (both brown and white varieties), Wild or Canadian (gray) and Egyptian (coloured). Of these the "Toulouse" seems to have been produced in France, its plumage much resembles that of A. anser but the colour pattern is simpler. The "Embden" has been obtained by North German breeders in and around Westphalia by selecting white "sports" and breeding from them. The history of the "African" breed is somewhat uncertain. It is said to be a cross between the Chinese goose, the Toulouse breed and sometimes the Embden. The fleshy protuberance on the beak is characteristic of domesticated forms of the Chinese species, also the black stripe down the back of the neck, while the plumage resembles to some extent that of the Toulouse goose. The 3 above-mentioned breeds are heavy weight or market varieties, weighing frim 17 to 25 lb. when properly fattened.

The Egyptian breed comes from an entirely different species (Chenalopex aegyptiacus) which has been of much importance to the domestic economy of Egypt ever since the beginning of history.

The Canadian goose is the domesticated wild goose of North America (Branta Canadensis). It is easily tamed, but has little commercial importance as a domesticated breed. The Chinese goose (Cygnopis cygnoides) lays well and furnishes a good quality of meat; it is the largest of all wild geese and weighs from 10 to 14 lbs. It is yearly becoming more popular in the United States and deserves to be widely kept. All these species can be interbred freely in captivity.

KEEP FEWER HORSES

In these days of efficiency and economy, it is highly important that every man should do everything possible to reduce the total number of horses it is necessary to keep and to increase the ways of finding profitable employment for them. The idle horse is a border and an expense. Keep him busy. Live stock that will produce meat, milk or eggs in return for the feed eaten can be kept profitably employed the year around, while with horses there are times when they must of necessity stand idle.

... ERGOT IN RYE POISONOUS ...

Ergot, sometimes called spurred or horned rye, is caused by a fungus that replaces the kernel with a kernel-shaped body one-half to one inch in length and of a purplish color. Ergot bodies also form on some of the wild grasses as the rye grasses, wheat grasses, blue joint and reed grass.

The poisonous character of ergot is principally due to its exciting influence on the muscle fibers of the uterus and amsller arteries. As a result of the former, conraction of the uterus results, which, in pregnant animals results in the expulsion of the foetus, abortion. The latter action causes the contraction of the walls of the tissue feeding arteries, which prevents the passage of the volume of blood required for the nourishment of the tissues. Tissue thus deprived of blood, dies, and in such cases we speak of gangrene. This usually happens to the extremities, as the lower part of legs, tail, ears, or teats in cattle; and the comb, wattle, toes, wings, or tongue of poultry. Ergotpoisoned animals show weakness, dullness, and paralytic conditions of some muscles.

To eradicate ergot, do not sow rye infested with it, and land that has grown a crop of rye infested with ergot should have some other crop on it for two or three years. It is best to follow the rye with a cultivated crop. In case a grain crop follows, volunteer rye usually comes up and the ergot is given a chance to increase.

Don't depend upon the wine bottle to get your business. The ink bottle is a better producer.—Hoeflich Printing House.

COMING EVENTS

New Brunswick Farmers' and Dairymen's Association begins January 29, 1917, and New Brunswick Provincial Seed Fair, Fredericton, N. B., January 31, 1917.

Butter and cheese makers courses at the N. S. A. C., Truro, March 7 to April 4, 1917.

STRAWBERRIES

It is not too early to think about this years strawberry acre. We can supply plants from all the varieties most profitable in the Maritime Provinces. Our new Catalogue, out this month, tells all about them. eLet us send it to you; learn about the fall bearing strawberries, they are a real success.

OUR MOTTO:

"ONLY GOOD GOODS"

And We Live Up To It Continually

QUALITY Counts, Certainly

You who are looking for a CHEAP but SERVICEABLE STOVE (whether it's a Cook-Stove or a Heater) ought to be interested in the line we manufacture in Fredericton:—

"NIAGARA" Cook Stove, 2 sizes. Wood or Coal.
"WATERLOO" Cook Stove, 2 sizes. Wood.
"FAVORITE" Cook Stove, 2 sizes. Wood.
"CARLETON" Hall Stove, 3 sizes. Wood.
"TIDY" and "SQUAT" Coal Heaters. ("TIDY" in 3 sizes.)
"RAMDOWN" Stove for camp use. 3 sizes.

These are PLAIN stoves, prices ranging from $10.00 to $16.00, but they will DO THE WORK satisfactorily. Ornamentation does not help a great deal in WARMING the house on a winter day.

No particular quality of WOOD required. Good bakers. Good heaters.

IN FREDERICTON we also make WOOD FURNACES, as well as Lumbering Machinery, Builders' and Contractors' Supplies, Stove Utensils, IRON FORGINGS, IRON and BRASS CASTINGS, ETC., ETC.

Some Results From Spraying Work of 1916 and Recommended for 1917

By C. E. Saunders

Field Officer in Charge Dominion Entomological Laboratory, Annapolis Royal, Nova Scotia

The value of spraying was demonstrated in 1916 in fully as striking a manner as in the previous seasons of 1915, 1914 and 1913. On account of the "Pit" (probably an arrested development of the black rot fungus, **Sphaeropsis malorum**) developing to such a degree and the people on the whole being more keenly on the watch for differences between sprayed and unsprayed orchards, I believe that there has been more talk about the benefits of spraying and more people converted to the fact that they cannot afford not to spray, in 1916, than ever before in a single season in the Annapolis Valley.

The apple crop of 1916 was very uneven and on the whole short. The reason for this was the small bloom in the spring of 1916 and the main reason for that, not the only one, but the main one,was lack of thorough spraying in 1915. The amount of bloom is influence by the leaves being retained on the trees late in the previous autumn. The retaining of the leaves depends to a certain extent on the cultivation and fertilizer, particularly nitrogenous fertilizer, but it depends more than anything else, on thorough spraying, which keeps the blackspot off the leaves.

In 1915 we sprayed an orchard in Annapolis, an orchard of about three acres that had not given over 25 barrels per year for the four years previous and in 1914 gave only 15 barrels. The year we sprayed it, 1915, it gave 85 barrels. In 1916 it was not sprayed but it gave 160 barrels, showing that in this orchard, as in many others, the spraying of the season of 1915 influenced the crop of 1916 more than it did the crop of 1915.

The failure of most orchards in 1916 was due to lack of spray, care of fertilizer the previous year, more often the lack of spray than anything else.

One thing that the season of 1916 has demonstrated more clearly to me than anything else is the fact that there are practically no off years in the well cared for orchards in the Annapolis Valley. Men like Ray Clarke, A. S. Banks and F. H. Johnson have had less variation in their apple crops year by year, for the past seven years, than there has been in the corresponding wheat crop of the West. I will venture to say that each one of them is reasonably sure of getting within 20 per cent of his 1916 crop in 1917, no matter how unfavourable the season of 1917 may be. In this they are simply judging the future by the past. They have never had a failure since they started spraying properly and correspondingly never a bumper crop, but a succession of even crops. If you talk to any one of them in regard to what they consider the most important operation on their farms they will tell you it is spraying. If it were a question of having to stop spraying or stop all other orchard operations they would not stop the spraying.

I mention these men simply because I know their methods and records. There are hundreds more like them in the valley or we would have had a shorter crop than we did in 1916, as the crop was, for the most part, in orchards that had a record of two or more years of good care, and that was the reason for it being on the whole of such remarkably high quality. The non-sprayers did not have any apples to get spotted.

With spraying the most important operation in the Annapolis Valley and with the materials used sometimes causing trouble and sometimes appearing wasteful, we have found it necessary to take up the study of spraying material very carefully and after two years of work have recommended the somewhat drastic changes indicated in the circular on, "Spraying for Insects in the Apple Orchards of Nova Scotia," with which I hope you are all supplied.

The contrast shown in the orchard of Mr. G. L. Thomson of Berwick in 1915 and in two of our experimental orchards, coupled with the statements of many of the most responsible growers, convinced us that the lime sulphur and arsenate of lead combination was doing, in some cases, an immense amount of damage by causing the set of apples to drop and showed us the necessity of investigating fully some of the most common spray mixtures with regard, not only to their cost and efficiency in controlling pests, but also with regard to their effect on the crop of fruit.

To test some of these points a small, even, orchard of Wagner apple trees was secured from Mr. F. H. Johnson of Bridgetown and a portion of the trees were sprayed once before and twice after the blossoms with the following solutions and gave the following results:

No. of apples picked from two small Wagner trees sprayed with varying strengths of lime and sulphur.

Lime Sulphur.	Dry acid arsenate of lead, 1 lb. to 40 gal.	Dry arsenate of lime ¾ lb. to 40 gals.
1.004 sp. gr. or 1 to 75	212	122
1.005 1 to 60	86	126
1.006 1 to 50	159	125
1.007 1 to 43	27	152
1.008 1 to 37½	33	56
1.009 1 to 33	1	44
1.010 1 to 30	5	36

Unsprayed trees averaged 277 apples per pair.

This set of trees showed us that lime and sulphur 1 to 43 and stronger, with lead arsenate, would burn the apples enough to cause severe dropping and that lime and sulphur 1 to 37½ and stronger, with arsenate of lime would also cause the same injury. Where arsenate of lime was used it caused less burning and less dropping of the fruit than where arsenate of lead was used with the same strength of lime and sulphur.

In conjunction with this test we tried out both Bordeaux mixture and lime and sulphur to find out at what period the lime and sulphur did the most burning and the most removing of the apples and also to see if there was a period at which Bordeaux mixture did less damage than the lime and sulphur. The following are the results.

No. of apples per pair off Wagner apple trees when sprayed at the following period with the following solutions.

	Lime Sulphur 1.009 spgr. Dry acid lead arsenate 1 lb to 40 gals	Bordeaux 4-4-40 Dry acid lead arsenate 1 lb to 40 gals
Immediately before the blossoms only	159	327
Immediately after the blossoms only	108	204
Two weeks after the blossoms only	30	231

Unsprayed trees averaged 277 apples per pair.

Percentage of russetting when Bordeaux was used

Immediately before the blossoms only, 7 per cent russetted.

Immediately after the blossoms only, 43.6 per cent russetted.

Two weeks after the blossoms only, 3 per cent russetted.

These figures show, as the orchard of Mr. G. L. Thomson showed, that the greatest damage comes from the use of strong lime and sulphur two weeks or more after the blossoms and it also shows, as Mr. Thomson's showed, that Bordeaux used two weeks after the blossoms is harmless in so far as removing the set is concerned.

In regard to the russetting which comes from the use of Bordeaux mixture, the experiment corroborates the statement of Mr. U. P. Hedrick in Bull. No. 287 of the New York Agr. Expt. Sta., in which he states, "From the study of the matter at this station it does not seem possible that Bordeaux injury occurs on apples after the hairs have been shed, the stomata changed to lenticles and the waxy coating formed". He further states "That the period of immunity begins with Baldwins and Rhode Island Greenings in from four to six weeks after the blossoms drop. It may be assumed that the time for these changes must vary greatly with the season and possibly with the variety."

It also corroborates the statement of Prof. W. J. Morse of the Maine Agr. Expt. Station in Bull. 252 in which he states, "Again as in 1914 an application of 3-3-50 (wine gallons) Bordeaux mixture on plot 4 before the flower buds opened resulted in leaf injury and increased fruit russetting—the amount of russetted fruit as compared with the check was increased about 9 per cent."

Our experiments in regard to the russetting caused by Bordeaux, although conducted on a small scale, are thus corroborated by the work of two of the best spray men in the United States, and may be taken as approximately correct. We do not claim that Bordeaux will give absolutely no russetting two weeks after the blossoms, but we do claim that it will cause less injury than any other equally efficient spray used at that period.

When we had finished our work in Mr. Johnson's orchard and had decided that, in view of the price of spraying materials at the present time, it would be best to recommend lime and sulphur weaker than formerly for the first three sprays and a weak Bordeaux for the last summer spray, it was found that Mr. Wheelock Marshall of Beaconsfield had practically followed this plan, spraying once before the blossoms with a 1 to 50 lime sulphur solution, once after the blossoms with a 1 to 60 lime and sulphur solution and two weeks after the blossoms with a 6-6-100 Bordeaux mixture.

While Mr. Marshall's orchard did not have a crop throughout, owing to a small bloom, he had the best foliage and the best fruit that I have

seen this year. There was no russeting of the apples and no burning of the leaves that could be attributed to the spray. His Gravensteins ran 99 per cent free from blackspot.

Spraying Recommendation for 1917.

In the face of this evidence and more, which we have not published, Prof. Brittain and I in making up our joint spray calendar have recommended

..**For the First Spray.**—Lime Sulphur 3 to 100 and arsenate of lime 2 lbs. to 100 gals.

Second Spray.—Lime Sulphur 2 1-3 to 100 and arsenate of lime 2 lbs. to 100 gals.

Third Spray.—Lime Sulphur 2 to 100 and arsenate of lime 1½ lbs. to 100 gals.

Fourth Spray.—First Choice. Bordeaux mixture 7-7-100, using either arsenate of lime or arsenate of lead as a poison.

Second Choice. Lime Sulphur 1 2-3 lbs. to 100 and arsenate of lime 1¼ lbs. to 100 gals.

Fifth Spray.—Where necessary, the same in material at the fourth.

These recommendations are made in full in the circular, "Spraying for Insects Affecting Apple Orchards in Nova Scotia", which is here for distribution if you have not already received a copy. We are recommending the same nozzles, the same pressure and the same dates as last year. We are recommending a weaker solution of lime and sulphur and where possible the substitution of Bordeaux mixture for lime and sulphur for the last summer spray. We are recommending arsenate of lime in place of arsenate of lead in all lime and sulphur solutions. Which poison to use with Bordeaux mixture is a matter of choice.

Now in regard to substituting arsenate of lime for arsenate of lead. First; arsenic, in the form of arsenate of lime, will cost less than 70 per cent of what arsenic will cost in the form of arsenate of lead in the Annapolis Valley during the coming season. Second; as shown in the results on young Wagners in the orchard of F. H. Johnson, given earlier in the paper, arsenate of lime does less damage than arsenate of lead with an equal strength of lime sulphur. When we add arsenate of lead to lime sulphur solution a chemical change takes place resulting in the formation of lead sulphide and three kinds of arsenate of lime, one of them, mono calcic arsenate, is entirely soluble and is the cause of a large portion of the burning which comes from the use of lead arsenate and lime sulphur together.

When arsenate of lime is added to lime sulphur no chemical change takes place and so no soluble arsenic is formed. Arsenate of lime both theoretically and practically is safer than arsenate of lead with lime sulphur.

Third; arsenate of lime causes less waste when added to lime sulphur solution than arsenate of lead. When arsenate of lime is added no chemical change takes place but when arsenate of lead is added nearly all the lead goes to the bottom of the tank as lead sulphide percipitate or "sludge", taking with it 35 per cent of the sulphur from solution and it is on this sulphur that the solution depends for its fungicidal value. The lead arsenate causes the loss of more than one third of it. Further the lead sulphide sludge prevents proper agitation and so causes much poison that should go on the trees to be retained in the bottom of the spray tank. Fourth; arsenate of lime is cheapest in its most convenient form, namely the powder. Arsenate of lead is cheapest in the paste form. The fact that the arsenate of lime comes as a powder not only saves time in the field but it makes the measuring of the poison at once easier and more accurate.

In using arsenate of lime one should always remember that it must never be used alone. When used with lime sulphur, soluble sulphur or B. T. S. it is safter than arsenate of lead, while with Bordeaux mixture it seems equally safe, but when used alone it will cause severe burning. For use alone arsenate of lead is by far the better poison.

One of the most common sources of trouble in spraying in the Annapolis Valley today is the fact that often the fruitgrower does not realize the difference between the wine gallon and the imperial gallon. The owner is perhaps told by the agent that his tank holds 200 gallons. So it does, but they are wine gallons. It only holds 160 imperial gallons. Then he takes an imperial gallon measure and measures out his lime sulphur, thinking that he has a 200 imperial gallon tank. The result is that his solution is 25 per cent too strong. Then when he has burned his trees he blames the recommendations or the hired man, when it was ignorance of the size of his tank that caused the trouble. At the beginning of the season measure your tank with the same measure as you use for measuring your lime and sulphur and there will be less trouble with the spray burning.

In applying the spray be careful not to use the drive nozzles for the spray after the blossoms. Before the blossoms they are almost indispensable in the control of budmoth, aphis and plant bug, but unless plant bug is present after the blossoms do not use the drive, use the calyx nozzle. It will cover a tree faster and better and there is less danger from spray injury with it than with the coarse driving spray produced by the drive nozzle.

Poisons For Canker Worms And Tussock Moth

The canker worms and tussock moths are two periodical insects that will probably be common enough to cause serious damage next year.

First to deal with the canker worm. As you know it is one of the hardest insects to control with poison. I have heard many claim that they will fatten on Paris Green and as a matter of fact it is a most difficult insect to kill.

Last year Prof. Brittain and I carried on an extensive feeding experiment to determine the rate at which poisons kill and the effect of fungicides on the killing value of the poisons used with them.

We found as a result of feeding several hundred lots of insects that lime sulphur, used with four of the ordinary poisons rendered the poisons 19.2 per cent less efficient than when they were used alone. Bordeaux mixture rendered the poisons 43.5 per cent less efficient than when used alone, while soluble sulphur on the other hand hastened the actions of the poisons, rendering them 13.1 per cent more efficient than when used alone.

We have found that soluble sulphur and arsenate of lime may be used in almost any orchard without bad results. When used twice, or oftener in orchards that are not in the pink of condition, yellowing and dropping of the leaves occur. Soluble sulphur is almost as good a fungicide as lime and sulphur and where an insect, like canker worm, is bad in an orchard, threatening to defoliate the trees if the most rapid killing poison obtainable is not used, I would recommend soluble sulphur 1 lb. to 40 gallons and arsenate of lime ¾ lb. to 40 gals. once, about three days before the blossoms. That is the most rapid killing combination that we have found as yet and is almost harmless to foliage if used only once in an orchard in one season.

In March 1916, Prof. W. J. Morse of the Maine Agr. Exp. Sta. published Bull. 249 "Six years of Experimental Spraying at Highmoor Farm." In this publication he notes the high fungicidal value of arsenate of lead when used alone. In 1912 he states that, "4 pounds of arsenate of lead paste alone in 50 gallons (wine) of water gave as good or better scab control than 3-3-50 Bordeaux mixture or lime sulphur plus 2 lbs. paste arsenate of lead to 50 gals. (wine) of spray." In 1913 he states "Almost perfect scab control was obtained with Bordeaux mixture, the larger amount of arsenate of lead used (2 lbs. to 50 wine gallons) and lime and sulphur 20 per cent stronger than standard dilution—the efficiency being in the order named. Nearly 39 per cent of the apples on the unsprayed plots were scabby." In 1914 and 1915 he reports practically the same results, double strength arsenate of lead alone being almost equal to Bordeaux mixture and lime sulphur as a fungicide under Maine conditions.

Last year in Nova Scotia we got very marked control of both scab and pit from the use of arsenate of lead alone in single strength.

When the orchard is not being highly fed and there is any danger at all from using soluble sulphur and arsenate of lime, I would recommend the use of 4 pounds of paste lead arsenate to 40 gals. of water alone for canker worm. The poison alone will kill more rapidly than with lime sulphur or Bordaaux mixture and when used alone and in double strength it is a very efficient fungicide and is absolutely harmless to foliage. Where an excessive strength of lead arsenate is used with lime sulphur increased burning results.

For orchards where canker worm is very numerous we would recommend either of the following, applied immediately before the blossoms open.

First Choice. Arsenate of lime ¾ lb. to 40 gals. Soluble sulphur 1 lb. to 40 gals.

Second Choice. Arsenate of lead paste, 4 lbs. to 40 gals. alone. The first is cheaper, the second safer.

For the tussock moth which promises next year to do an excessive amount of damage throughout the Valley, we have to put poison into the last summer spray, or that applied during the last days of June. With lime sulphur, as weak as it must be used for the last summer spray, we can only use a very moderate amount of arsenate of lime or arsenate of lead without damaging the trees and it would seem in the view of the high fungicidal value of arsenate of lead alone, that double strength arsenate of lead used alone would be one of the best sprays to use for the last summer spray in the orchards where the tussock moth is very numerous.

As a second choice we would recommend a sodium arsenate Bordeaux mixture made according to the following formula. Dissolve in a bucket of hot water 12 ounces to one pound of crystals of sodium arsenate. Use this liquid to slake 4 pounds of fresh stone lime and dilute to 20 gals. of liquid. In another barrel dissolve 3 pounds of bluestone (Copper sulphate) in 20 gals. of water. Pour a bucket from each alternately into the spray barrel. In case a stronger mixture is needed for potatoes, more bluestone and more lime may be added. Owing to the soda present in the Bordeaux mixture the poison in it, which is arsenate of lime, will act more rapidly and is more efficient than any other poison that we have yet used with Bordeaux.

The poisons recommended for orchards very heavily infested with tussock moth are the following, applied during the last days of June or early July.

First Choice—Sodium arsenate Bordeaux mixture. The more efficient fungicide.

Second Choice.—Arsenate of lead paste, 4 to 5 lbs. to 40 gals. Somewhat the safer.

Among other mixtures that we used at the laboratory during the past summer was a Bordeaux mixture made by using the commercial hydrated lime in place of stone lime which eliminates most of the trouble when making Bordeaux. The formula for making is as follows. If a 7-7-100 Bordeaux is required, make up a stock solution of bluestone or copper sulphate by dissolving one pound of bluestone in each gallon of water, or 40 lbs. of bluestone in a 40 gallon barrel of water. Pour into this 100 gallon spray tank 7 gals. of stock bluestone solution then fill the tank up by adding 93 gallons of water. Add to this 7 pounds of commercial hydrated lime, start the agitator, add the poison and the mixture is ready to be applied. For safety it might be best to add a slight excess of hydrated lime. Arsenate of soda should not be used with Bordeaux mixture made from hydrated lime. Triplumbic arsenate of lead is the best poison to use with this type of Bordeaux mixture. Acid or standard lead arsenate coming next and arsenate of lime next to that. Hydrated lime has the advantage over stone lime in not losing its value to any great extent when stored in small quantities in sacks for two or three months.

The spray calendar which Prof. Brittain and I have written for 1917 contains the best that we know at present about spraying materials and methods. The change to Bordeaux mixture for the last summer spray has, and will, arouse comment. I expect that some people will report slight russetting from the 7-7-100 Bordeaux that we recommend for 2 weeks after the blossoms, but on the whole there will be little trouble from it as the down or pile is pretty well off the young apple by the end of June. Until the apple surface becomes smooth there is of course danger of russetting but Bordeaux used two weeks after the blossoms resulted in less russetting than that used immediately before the blossoms in all of our work in 1916.

Lime and sulphur used too strong two weeks after the blossoms has caused the loss of an enormous amount of apples throughout this valley for the past six years. Use a mist or calyx type of nozzle for after the blossom sprays and do not get the solution too strong. Whenever you get leaf injury after the blossoms you may be sure that you are causing a corresponding amount of the fruit to drop. Many do not notice the drop and blame the failure of their orchards to other things when too strong a spraying solution is the cause.

A stranger to the Annapolis Valley listening to this paper might think that I was not in favour of spraying or perhaps get the dea that it is best not to spray, but if we are going to do a thing we should do it in the best way and with the best materials and should like you to discuss these materials and their use thoroughly here this evening. Five years ago a man might have hesitated about talking as freely of spray injury before an Annapolis Valley audience as I have today. Then all were not certain about the value of spraying. Today there is not a single man in this audience who is not convinced as to the value of spraying with present solutions and if there is anything better going he wants it, so I have felt free to tell you all I know, to talk over what I think and to speculate on what I do not know but intend to find out, with no fear of anyone drawing wrong conclusions.

The Annapolis Valley is indebted to the Dominion Fruit Inspectors and to the officials of the United Fruit Companies for assisting in many ways the campaign for more and better spraying. Two years ago Mr. D. Johnson, Fruit Commissioner,

said that he did not want his inspectors to go at the people with a club to fine them if possible, but he wanted them to teach people to grow and pack better fruit. The value of the Dominion Fruit Inspectors to the Valley during the past three years will never be fully appreciated. Th y have each argued with and convinced hundreds of people that they can not afford not to spray and so been one of the main causes of Nova Scotia having the cleanest and best crop of apples in eastern America this year. To the officials of the Fruit Companies the Valley owes a debt of gratitude along other lines. They have talked spraying and growing better fruit and then gone a step further; they have purchased their poisons, both last year and this, so that the grower has been able to buy them at about three fourths of the market price elsewhere. By keeping the price of spraying materials down and by placing a premium on growing clean fruit, the companies have been of inestimable value to the Annapolis Valley and as they grow they will be a still greater factor in the production of good fruit.

On occasion we hear that a certain company is changing its system of charges, is starting to charge on all barrels of apples delivered at the warehouse instead of on the barrels packed out. Again we hear that a certain company is going to ask this or that member to take account of sales for his fruit or not bring them to the warehouse, that the United is going to ask a certain company to take a separate average for its fruit because, on account of the lack of spraying in the neighbourhood, it is impossible to make a good pack of the output of that company. All of this indicates that the management, or in other words the men who control the companies and who are usually growing the best fruit, are determined to force the members to grow good fruit or else take separate prices. The companies do not want unsprayed fruit, it pulls down the average of the pack as well as the price that would otherwise be realized from good stock. The man who does the most "kicking" in the fruit company, and with the least reason, is almost invariably the man who grows the poorest stock.

We hear talk of high freights, etc., and there is no doubt some truth in what we hear, but are we not partly to blame? We have a bumper crop like 1911 and insist on the railway furnishing equipment to haul it out. Then for a period of years we grow less than half of the quantity produced in 1911 and as a result all that extra equipment lies idle. Who pays the dividends on that idle equipment? The grower. If we produced an even crop of apples year in and year out the railway would know exactly what to expect and could then handle our apples at minimum cost.

More spraying will do more than anything else to establish commercially our apple crop. In Round Hill, which is probably the best sprayed district in the Valley, the crop for the past four years has varied within 35 percent of the average for the four years, and that average has been about 72 per cent of the bumper crop of 1911. During the same four years the Annapolis Valley as a whole has averaged 42 per cent of its 1911 crop.

During the past three years Mr F. H. Johnson of Bridgetown, one of the best if not the best, sprayers in the Annapolis Valley has had 840, 860 and 852 barrels of apples respectively in the years 1914, 1915 and 1916 from his five acres of orchard, or a variation of less than one and one half per cent from the average for the three years. This is a most remarkable record and Mr. Johnson attributes it more to his thorough spraying than to any or all of the other factors that enter into the production of his fruit.

Mr. W. G. Clarke of Bear River has had in his orchard in 1914, 1915 and 1916 respectively 374, 234 and 331 barrels of apples or a variation from the average for the three years of less than eight per cent.

Another orchard the owner of which does not want his name mentioned, but whom you would all recognize as one of the most thorough sprayers in the Valley has taken approximately the following crops from his orchard, of course basing all on a 100 per cent or perfect crop in 1911

Percentage of 1911 crop in 1912	69
Percentage of 1911 crop in 1913	55
Percentage of 1911 crop in 1914	75
Percentage of 1911 crop in 1915	57
Percentage of 1911 crop in 1916	55

Average percentage of 1911 crop since 1911, 63 per cent.

Variation from the average crop since 1911 has been less than 20 per cent.

I have the records from two varieties of apples from one sprayed and one unsprayed orchard at Round Hill, the sprayed orchard belonging to Mr. L. Wiltshire.

Average Percentage of 1911 Crop Since 1911.

	Sprayed	Unsprayed
Nonpariels	96.6	31.66
Granvensteins	109.76	34.8

Percentage of No. 1 and 2 Gravensteins packed from the above orchards.

Year	Sprayed	Unsprayed
1914	90	34
1915	40	22
1916	88.7	53

or more than three times the total crop over a period of five years and about twice as many No. 1's and 2's, from the sprayed orchard.

These records, and there are dozens more if we could only get them, show that there are practically no off years in the well sprayed and well cared for orchards of the Annapolis Valley. Fifteen years ago a man could stand up in these meetings and complain of canker worms or caterpillars defoliating his trees and get a respectful hearing. Then years ago you began to ridicule that man, five years ago you stopped listening to him, you knew that such insects were the result of neglect on the part of the owner. The same is true of scab or black spot years ago you sympathized with each other over having spotted apples, five years ago you began to realize that a number of men were growing clean apples every year by thorough spraying. Today a man who address this audience and complains of his apples growing spotted is at once ruled as a "joke" or a "back number." You have no sympathy with him at all. You know that the spotted apples are no more than an evidence of his neglect.

I am going to predict that in five years time you will accord the same treatment to the man who complains of his apple crop failing that you do today to the man who has canker worms or who grows spotted apples. We have today a mass of evidence which goes to show that there are no failures and practically no short crops in well sprayed and well cared for orchards. As years go on I am sure that we can improve the sprays still further and I believe that it is possible by more general, more thorough and more intelligent spraying to stabilize the crop of the Annapolis Valley to within 20 per cent of normal in quantity.

With extreme variation eliminated we could expect coopers, warehouse men, fruit companies, railways steam boats, auctioneers and commission men to handle the crop with greater economy and so return the grower increased profits over and above his individual profit through thorough spraying. I have endeavoured in this paper, gentlemen, to give you a report of the most important work carried on during the past season in the laboratory which you assisted so well in getting for Nova Scotia. It is Dr. Hewitt's policy to have our most important findings placed before you in time to be of use in your next seasons work and so to be of the greatest benefit to you. I thank you for your support in the past and hope that our cordial relations of the past will continue and be in the future as they have been in the past, mutually beneficial.

Annual Convention Nova Scotia Farmers' Ass'n.

Organization Attains Its Majority

The Nova Scotia Farmers' Association attained its majority at its twenty-first annual meeting held in the Parish Hall, Amherst, on January 23rd, 24th and 25th.

There was a representative gathering of farmer delegates from all parts of the province. The two extremes, Cape Breton and Yarmouth sent strong delegations. The South Shore particularly Lunenburg County, was also well represented and as usual the Valley counties and Cumberland, Pictou and Antigonish counties contributed their usual quota of brainy tillers of the soil.

After the opening prayer by H. S. Shaw and prior to the reading of the president's address, the president, Mr. R. J. Messenger, named the following committees:—

Credentials—R. M. Jackson and S. A. Cook.

Resolutions—Wm. O'Brien, S. A. Logan, Walter Purdy, Ronald McDonald and S. P. Goudey.

The President's Address

Fellow Farmers:—

The agricultural history of the past year differs somewhat from that of 1915. Taken as a whole, it was a harder year for both producer and consumer; due in a measure to conditions resulting from the economically disastrous and inhuman conflict in Europe, but in some sections of the Dominion to adverse weather conditions. Enlistment has proceeded steadily exacting a comparatively heavy toll from the rural districts both in laborers and farmers and more are needed to take the place of those who have done their bit and passed to their reward.

Right here let us pay a well deserved tribute of honor to our own Canadian troops who have never in one instance, given us cause to blush, but who, on the contrary, have rolled back again and again to Canada the story of dauntless heroism and loyalty to the cause of right.

Newspapers, ignorant of the real difficulties of the producer, politicans and the other counterfeit patriots have spent the past two years in urging the farmer to produce more and at the same time to offer himself for service in the trenches of Europe. The farmer in response has given more than his share of enlistment, and, if weather conditions had been better, would have produced above an average.

He has, however, felt the strain of diminished labor supply and on the average is this year getting a smaller income with larger expenses. And though butter, eggs, pork, etc. are higher than ever before, the labor and feeds necessary to produce these commodities are so much enhanced in price that the net value of the producer is no greater than in former years, while the other necessities of life are much more expensive.

Work of the Year.

During the winter of 1916 the Commission of Economics and Development asked for an expression of the needs and problems of the Maritime farmers, with a view to finding how existing conditions could be improved so as to enable rural workers to increase production, and make that production more profitable. To obtain an expression of opinion, Professor Cumming called at Truro in March a meeting composed of the executives of the Nova Scotia Farmers' Association and the Maritime Stock Breeders.

Before attending this meeting, I obtained by correspondence, the opinions of some fifteen of the most prominent farmers of the province including our directors, and a resolution and recommendations from the Annapolis County Farmers' Association.

This correspondence and the discussion at the meeting disclosed the fact that the principal needs of the Maritime farmers were:

1st—Lower freight rates on feeds and fertilizers.

2nd—Free agricultural Implements and fertilizers.

3rd—Cheaper Plant Food.

4th—Cheaper money and longer terms of credit at banks.

Professor Cumming was appointed to represent the Maritime Provinces before the Commission and your president to interview the heads of the Freight Departments at Halifax regarding lower rates.

This latter report was made to Professor Cumming who will probably embody it in his report.

The Halifax Exhibition.

An exhibition may be of great benefit for several indifferent reasons: the most important of these is the fixing and distribution of the most desirable types and conformation.

Individual ideas lead to confusion. Types fixed by Stock Associations composed of the most intelligent breeders of producers and these types, given the preference by the judges at the exhibitions, should result in ever-increasing excellency.

I am sorry to say, however, that even large groups of producers make costly mistakes and these mistakes take time to correct. A case in point is the Ayrshire cow. Up to within the last five years the prize Ayrshire was a smooth, tidy little cow, whose udder carried an almost straight underline. This of necessity resulted in the short teats which have injured the reputation of the Ayrshire as a satisfactory milker. Thanks to a few unprejudiced practical men, the folly of breeding this type is beginning to be recognized and the demand for larger teats and production will bring the necessarily more pendulous udder and the larger, more rangy type of body.

Personally and for the sake of the

educative value, I consider the judges should do their thinking aloud so those at the ringside could hear why certain animals were turned down or others won, as is done at our short courses. The excuse that those showing would not want the public to know the discrepancies of their stock or produce, seems a flimsy one. To the young breeder who wants to learn with a view to future showing, it would be a boon in helping him to breed what is wanted and would tend to increase the number of entries. Even experts disagree, and if a judge is ashamed to give reasons for his decision, he should not be in the ring.

The Halifax exhibition is supposed to be a child of the Nova Scotia Farmers' Association. If so, it is a difficult matter today to recognize its parentage. It has almost lost its plain country appearance and is now in the full dress of a betinselled city vaudeville. I spent two hours in the morning and two more in the late afternoon of September 15th down in the swamp at the farthest end of the grounds among the stock, after a struggle through the crowds at the entrance. Down there it was like being on the lonely prairie, as far as contact with human beings were concerned.

During the morning visit I do not think I met fifty different persons, and these wore the bored appearance of those who had come down for the reason that they wanted to see everything that could be seen free of cost, and thus get full value for their 25 cents.

Around the judging ring was the reporter for the Maritime Farmer and an occasional government official. Occasionally a spectator passed with a timid, sidelong look at the judge as if he were afraid he might learn something of the operation of some secret society. In the Sheep and Swine buildings the loneliness increased, until one felt the inception of homesickness. Once in a while a pen would be found with an animal in it, sufficient to remind the spectator where he was.

The small breeder cannot take his few anmials to Halifax without heavy individual expense, so the show in stock narrows down to a few professional breeders, in some cases with little or no competition.

When, however, I try to express my opinions of conditions obtaining between the manufacturers' building and the grand stand, I find my education in English woefully inadequate. Take the tower of Babal, the streets of Ascalon, the Bowery in New York, and the lunatic asylums of the continent, and mix them in one great crucible and you would approximate the Halifax fakir row.

The Herald and Chronicle get pretty near the truth sometimes. Listen to what they say speaking of the fakirs:

"Morally they are damnable; financially they are appalling. During the eight or nine days the exhibition was open, thousands of young persons had their lowest passions stirred by the sights they saw on the midway, and thousands of innocents, lured on by the hope of beating a fakir at his own game, were fleeced out of their last cent and hundreds of these young people had implanted in them the seeds of gambling.

The gamblers and other attractions carried away with them from $30,000 to $40,000 filched out of the pockets of our citizens. How many sick and wounded would it take care of? What a magnificent contribution it would make to the Red Cross or other funds, and yet the outstanding features that bring about such moral degradation and financial loss to our country are considered by the commissioners as necessary parts of the exhibition.

"We believe that every thoughtful citizen will say with us, "Shame on such work!" if we cannot conduct the fair on clean and educative lines, making education its outstanding feature and its amusements clean and pure, then for heaven's sake abolish the fair and thus remove what, this year, was a disgrace to the province. One pair of fakirs who had $5000 changed at the bank was heard to say to the other "Not too rotten for eight days among the Halifax rubes." Is there any need of further comment?

The Agricultural College

The good work of the Agricultural College is increasing every year both in extent and efficiency. Besides the associate course and the yearly short course, the extension work is becoming an important feature. The short courses in other parts of the province though only locally attended are exerting a marked influence; while the Entomological Department is doing good work among the orchards.

Possibly one of the most important activities of the college is the dissemination of Superior Stock increasing in excellency every year. This is not only of direct benefit to the province but is also a stimulant to the improvement of private herds.

The Farmer's Problems

As intimated before in this address, the Commission of Economics and Development asked for an expression of the needs of the Eastern Farmers; and Principal Cumming was delegated to carry our needs before this commission. Whatever his report may disclose, I have not heard of any material improvement in conditions which that meeting asked for.

The greatest problem which the farmer has to solve is himself. Back of all these unsatisfactory agricultural conditions s the farmer, inert, passive, submissive, yielding a more or less willing slavery to his servant-masters, the politicans and business men.

His Position

He is a political football. In the government of his country he has no voice. There are eleven bona fide farmers in the Federal Parliament or about 4½ per cent of the representation while the rural vote is more than 50 per cent. In our present local parliament there is one lone farmer, who carries as much weight as a breath of air.

The political candidate loses no sleep over the rural vote. The farmer is left in charge of the local heeler who knows that he can be herded into line at the call of the "grand old party" of his father and grandfather.

If he makes a struggle for independence by tryng to form unions to strengthen his position, all the interests which would suffer by his increase of power combine to keep him down. The business man with whom he deals fixes the price of what he sells and what he buys. He is taxed out of all proportion for the land he owns, for the plant food to enrich that land, and for the implements to till that land, all to satisfy the greed of the thousands of non producers who fatten on his efforts to make a decent living.

He is the drudge of every nation and no one outside of his calling is willing that he should be anything better.

Why?

1. Simply because if he would control legislation and gain a measure of prosperity proportional to the labor he performs and equal to that of the business men with whom he deals it would mean higher food prices and more expensive living for all non-producers.

2. A considerable number are uneducated and therefore unable to express themselves in public. A man must be able to express himself to wield an influence in public.

3. Always hard at work to earn a

KILL YOUR FARM
---AND---
GARDEN PESTS

LARVAECIDE WILL DO THIS SURELY--QUICKLY

Destroys Wire Worms, Slugs, Cabbage Worm, Cabbage Maggot, Onion Maggot, Potato Bugs, Cut Worms, Leather Jacket, Centepedes, White Grubs.

Larvaecide is the most economical preventative of these pests known. Larvaecide fills a long felt want. Only 250 lbs. required to an acre of light soil and 350 lbs per acre will treat the heaviest soil.

LARVAECIDE IS NOT AN EXPERIMENT—IT IS A PROVED ANTI-GRUB AGENT.

It must be thoroughly mixed in the soil.—Must not come in contact with growing plants.

John F. Wallace, Hillsboro, N. B.; A. T. Downing, Albert, N. B.; H. J. Steeves, Salem, N. B.; Judge J. M. Owen, Annapolis, N. S.; C. F. Peck, Hopewell Hill, N. S.; G. A. Hawkesworthy, Annapolis, N. S.; H. D. Cochrane, Cape Station, N. B.; W. M. Steeves, Hillsboro, N. B.; W. H. Weatherspoon, Granville Ferry; Wm. Duby, Turtle Creek, N. B.; Geo. E. Corbett, Annapolis, N. S.; and Geo. Balsor, Granville, N. S., are among the many who bear unsolicited testimony to the absolutely destructive properties of Larvaecide to insects which make farming and gardening more laborious and less profitable.

Not only will Larvaecide destroy insect pests but it will positively prevent club foot. So says Mr. Geo. Newcombe of Hopewill Hill.

HERE'S A SAMPLE TESTIMONIAL

TRADE MARK

Dear Sirs—

Last spring I ordered a bag of Larvaecide for my garden which was infested with cut worms, slugs, etc. In order to prove its virtue, I used it on one side of the garden only, planting the other side without it. The vegetables grown on the side in which I used the Larvaecide were splendid, in fact the best ever grown by me, while those from the other side were as formerly, much eaten and of inferior quality.

I wish to place my order for double the quantity ordered last year, for this Spring's delivery.

Yours truly,
(Sgd) Geo. A. Hawkesworth.

Larvaecide is for sale by leading dealers everywhere in the Maritime Provinces.

FOR SMALL PLOTS USE IN QUANTITIES AS FOLLOWS:—

100x140 (about 1-3 acre) requires 100 lbs. LARVAECIDE.
50x140 requires 50 lbs. LARVAECIDE.
25x25 can be treated with one of our small boxes of LARVAECIDE.

For Booklet and full particulars write

living he cannot afford the time to meet in convention to discuss questions of vital interest to his profession and he thus lacks the broadening and encouraging effect of public contact with other minds and similar interests.

4. His want of knowledge and retired mode of life makes him suspicious and he is therefore a poor co-operator.

5. He has through long generations, allowed the business man with whom he deals and his party newspaper to do his thinking for him and he believes in them infallibly to his own injury.

In my humble opinion, there are three principal conditions or lines of action necessary to improve the farmers' position and give him his proper place in his country.

Education, Vocational Co-Operation and Political Co-Operation or Union

A certain amount of Education is necessary on general lines to give a man a taste for good reading; to broaden his social or national horizon; to enable him to grasp the economical, industrial and national questions that are arising every day, and to encourage him to take his place and lend his influence in the solution of these questions. An education gives the farmer more respect for himself and his calling, makes him self reliant; more liable to stand up for his rights, less of an easy prey for the man with an axe to grind at his expense.

I would like my farmer also to take the first two years at least in one of your agricultural colleges to give him the necessary theoretical knowledge of his own profession. But the most important of all forms of education is a thorough business training. A man with a business education, counts the cost of operations, rejecting those which show irremediable loss.

A mind trained in business is never satisfied with guess-work.

The farmer should be conversant with business law in all its phases that could possibly be of interest to him.

I have often wished that a comprehensive business course for farmers could be put on at our Agricultural Colleges, not of course as elaborate as those of our regular business colleges but embracing all that would be necessary for the farmer as a business man.

Vocational Co-Operation

Co-operation is being attempted as a factor in improving the farmer's condition, and so far, has been only partially successful owing to out side opposition and inside greed and suspicion. Theoretically it is good and its efficiency will depend in the honesty and ability combined of its adminis trators.

Political Co-Operation

As long as the farmer is a blind partizan at the beck and call of political jobbers, just so long will he have no influence in making laws favorable to his prosperity and advancement.

The Western farmers have largely become disgusted with party rule and are organizing to see what can be done by united effort, while the politicans are taking heed. These farmers have adopted a platform, calling for improved, equitable, and clean legislation. If they succeed in influencing parliament so as to obtain laws favorable to their interests, it will be a step towards encouraging farmers all over the Dominion to place the call of party second to their own interests.

Our Programme

This is a farmer's program. We have some live questions and we want every farmer here to feel free to take part in the discussions. In your discussions speak to the point. We hope you will be so unanimous in your demands for better legislation in regard to the rearing of sheep, improvement of roads, the elimination of mongrel sires and other questions of vital interest, that we may obtain something tangible at the next session of legislature.

The foregoing address was ordered to be published for the benefit of the farmers of Nova Scotia, who were not present at the meetings. Discussions on several of the most important items mentioned in the ad-

Economical Electricity on your Farm

Has electricity been an advantage you thought you had to do without? Then welcome Delco-Light! For here is clean, safe, brilliant electric light—convenient, cheap power—and all this economically. Here is electricity for your farm without bother, without trouble.

Make your farm home the most desirable of all homes. Add the cheerful, labor-saving, economical feature of electricity—save time for your wife and sons—your hired help.

A Completely Efficient Plant

No desirable feature has been forgotten, no unnecessary frill has been added, in building Delco-Light. The plant is simply operated—a child can look after it. Upkeep cost is absurdly small. Sufficient light is provided for house, barn, outbuildings, yard. Power is provided to run cream separator, churn, vacuum cleaner, water system and other light machinery.

The Delco-Light plant consists of one unit combining gasoline engine, electric generator, switchboard, storage batteries. Self-starting on the pressing of a switch. Stops automatically when batteries are charged. Needs little attention — Develops adequate power. Easily installed.

Prices now—No. 208 $375 and No. 216 $450. Prices after Mar. 1st—No. 208 $390 and 216 $465.

Completes Your Electric Plant

This is the Delco-Light Power-stand—an efficient, economical little electric motor that you can carry anywhere on your farm. Runs off the nearest light socket. Will run all small machinery. Save you hours of time and most of your hand labor. Absolutely safe even for children.

Full Literature FREE

We have prepared booklets describing Delco-Light fully. Send for them. They tell the whole story in plain, unvarnished English. They are of intense interest to every farmer. Your name and address on a postcard will do.

dress took place at various times during the convention.

The Sheep Problem in Nova Scotia

The Sheep Problem in Nova Scotia was the subject of an interesting talk by Mr. Geo. E. O'Brien of the Live Stock Branch, Ottawa. Mr. 'Brien said the advantages of the sheep breeding industry were quite well known. That it is a lucrative business when given a fair degree of attention, is not disputeed by anyone.

He did not purpose laying any stress on the advantages of the industry, as his purpose in coming before the meeting was rather to enumerate the sheep grower's disadvantages and by the aid of the intelligent farmers present formulate some plan of action that will tend to overcome some of the obstacles.

In discussing the sheep industry with prominent farmers in all sections of the Maritime Provinces, two main causes were advanced, viz: a lack of proper fencing and the ravages of dogs. The law should provide that line fences should be of such construction that they would be sheep proof. The dog nuisance has engaged the legislation of nearly every province of Canada in which sheep are kept. He read extracts from the laws of the several provinces anet this subject. To overcome the dog nuisance he suggested the taxing of dogs, the destruction of useless curs on which their owners refused to pay the tax, and the compulsory compensation for all damages done to sheep by dogs from the fund created by the aforementioned tax.

The question is often asked: Why do we not receive more for our wool and why does wool from other countries command a higher price than does the wool from our flocks?

The reasons why we do not receive more for our wool are: Because we do not grow large enough quantities. Because we do not take proper care of our sheep. Because we do not grow the grades that bring the highest market prices.

Mr. O'Brien concluded his interesting discourse by enumerating the main points to observe in the care and packing of wool and referred to the very successful wool sales that had been held in the Maritime Provinces last year. Several new centres will be organized for sales in 1917 and to those who will take the best care of their sheep and wool and who will place the product on the market properly graded, packed and unwashed will come the highest prices paid for the grades of wool here grown.

Problems of the Sheep Raiser

Mr. Wm. O'Brien, one of the veteran successful sheep growers of Windsor, addressed the convention on the Problems of the Sheep Raiser.

He said the most serious problems of the sheep raiser was the proper breeding, feeding and care of the flock. If these three are well attended to, the other problems will take care of themselves. The dog nuisance has not caused him any trouble, probably because Bill O'Brien is known to be handy with a gun and not a few of the canine species occupy unmarked graves in his pasture fields.

He does not believe in allowing sheep to wander all over creation. His advice is to keep them near as the sheephouse as possible and feed well. Sheep will not thrive on fence poles and spruce bushes.

Do not allow sheep to annoy yourself and your neighbors too. He was under the impression that more sheep die through neglect than from the ravages of dogs. Mr. O'Brien is a strong advocate for sheep dipping.

Mr. C. P. Blanchard, Truro, rehearsed his experiences as a sheep breeder and shipper and showed how this important industry dwindled and deteriorated. From personal observation he believed the dog nuisance responsible for the decline. He said our present dog law is not worth one cent to the sheep breeder. It is no use to try to promote the sheep industry so long as dogs run at large. It is far more important that we have a good sheep and dog law than that we have a Grit or Tory government.

Other speakers to this question were A. Hector Cutter, S. A. Cook, A. S. McMillan, P. Blanchard, Chas. Maxwell, M. A. MacLeod, Geo. Pinneo, and Messrs. Gates, Chisholm, Jones, Nichols, Lee, Murray and Corning.

Mr. Jones took the stand that the licensing of dogs would be preferable to their taxation.

Tuesday Evening

On Tuesday evening the farmer delegates were welcomed to Amherst by the President of The Amherst Board of Trade. In the course of his remarks he enumerated some of the things that all those who remain at home can do to win the war. The farmers of Nova Scotia are doing their bit nobly and well.

Mr. Wm. Murray, vice president of the Association replied to the address of welcome in his usual humorous style.

Mr. W. J. Black, Agricultural Commissioner for Canada and Mr. G. S. Campbell, Chairman of the National Service Board for Nova Scotia, both delivered excellent addresses to which we will refer later. The evening programme was interspersed with songs and readings by some of Amherst's best talent.

The Business Session

was held on Wednesday morning.

Director's Report

The year just passed has been one in which agriculture has found a prominence which it has never enjoyed before.

A normal labor market, a climate which never causes a total crop failure and an increasingly intelligent class of agriculturists has heretofore allowed the abundant production of food at low, or at most reasonable prices.

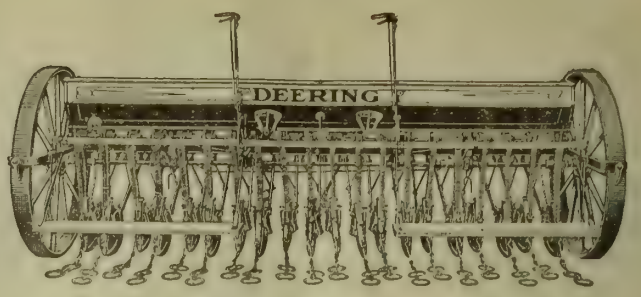
Since the war has entered upon its second year labor has grown scarcer every day owing to the heavy enlistment of farmers and farm laborers, and as a natural result there is a smaller production than last year. This is owing also in a measure to adverse weather conditions in different points of Canada during the past season. Canada has not produced as much of wheat, potatoes, beans, dairy products, and other staples in 1916 as in the previous year, while the relative number of consumers or non-producers has greatly increased. This state of affairs has led the latter class to realize, in a greater or less degree that the farmer is a very vital factor in the welfare of the country, and the production increased or decreases in proportion to the amount of rural labor. As a matter of fact, however the farmer is reaping a net profit this year very little, if any in excess of previous years, owing to the greatly enchanced prices of the commodities he has to purchase, particularly those which aid in production.

Your Directors held the usual meeting directly at the close of the annual session; owing to the feeling that Mr. Bryan's increasing duties at the college made it difficult to attend to the affairs of the Association, and also because of his necessary absence at the annual meeting, no Secretary was appointed.

The Executive, however, met in February and reappointed Mr. Bryan after correspondence with the Directors.

In April Mr. Cumming called a joint meeting at Truro of the Executive of the Nova Scotia Farmers' Association and the Maritime Stock Breeders to discuss the needs of Maritime farmers, with a view to carrying evidence before the Commission of Econ-

(Continued on page 241)



Right Planting Brings Profit

IF you are growing small grains for fun and not for the most profit, plant your seed any old way. But if you want every dollar of profit you can get, plant your seed right. Use a **Deering** drill. Right planting often means profit when the other fellow has to take a loss.

The local dealer who handles these drills carries the drill best suited to your work. With his advice you can choose a drill that will plant your seed in your soil and plant it so that you have a much better chance of getting a bumper crop.

The arguments for **Deering** drills are far too many to be told here. The dealer will show you all about feeds, furrow openers, bearings, attachments, etc. He will give you reasons for buying his drill you cannot overlook. See him and talk this over with him, or write to us and we will tell you all about the best drill you can buy.

No Crop Produces Profits Like a Maple Grove

Take any crop that you grow and figure out how much profit you have left after paying for ploughing, seed, fertilizing, cultivating, harvesting, labor, keep of horses, wear and tear on machinery, etc. Add to your cost a month of hot, dry weather and you are lucky to come out even.

Now go to your nearest neighbor who has a sugar bush with up-to-date equipment and ask him to tell you honestly how much syrup and sugar 100 average size maple trees will produce, how much he sells it for and what it costs to make it.

You will find that, acre for acre, a sugar bush will produce a bigger profit than any other crop that you grow—and with less cost for equipment, with less labor and in less time—besides the sugar season comes at a time of th year when no other work can be done.

Maple products are now higher in price than at any time in the history of the industry, let us show you how to produce the highest quality syrup and sugar and obtain the highest prices.

Ask us today to send you the fullest information about sugar making without cost to you.

GRIMM MFG. CO., LIMITED,

The publisher of the best Farmer's paper in the Maritime Provinces in writing to us states:

"I would say that I do not know of a medicine that has stood the test of time like MINARD'S LINIMENT. It has been an unfailing remedy in our household ever since I can remember, and has outlived dozens of would-be competitors and imitators."

HOW LIME BENEFITS FLOWERING PLANTS AND LAWNS

To the lover of flowers and rich foliage plants, we present to such in the introduction of Ground Limestone for the soil a new interest in the growing of such plants. The application of lime to the soil produces a wonder revelation in the rich, deep colored petal of the flower and the dark, rich green color of the foliage of the plants. The flowers by their added brilliancy appear to be an improved variety. The flowers when cut will not wilt down like those grown on soil deficient in lime.

All plants appear to take on a new life in such improved soil. And the effect of all fertilizer on the newly limed soil is soon noticeable, which is not the case in an acid soil. The best foreground and background for the display of beautiful flowering plants with their rich foliage is a beautiful lawn. Such a lawn cannot be had upon a soil deficient in lime. The grass on such soil presents a slender, limp growth of flat green color, with moss growing around its roots impoverishing its growth. Apply ground limestone to such soil at the rate of two tons per acre and notice the result in a short time. The grass will not shott up like a weed, but the lawn will become of a dark blue-green color. The blades of the grass will widen out from its base and become stiff and stout and vigorous. The moss will begin to turn a light yellow and in three weeks it has about all disappeared. When the lawn is in this condition any fertilizer placed upon the soil is soon very noticeable. The lawn mower will clip this improved grass more smoothly and evenly than ever before, for the reason that the blades of grass stand more erect and are stiff and tender, and easily cut.—Henry Bucey in Northwest Horticulturist Dairyman.

IS THE HIVE A CENTER FOR DISTRIBUTING FIRE BLIGHT?

The tests reported "prove conclusively to us that the blight organism, in honey, can remain sufficiently virulent for 47 hours to produce infection, with the extreme time measure of virulency probably not reached. Tests of this kind were made with fresh apple honey and also with well-ripened honey taken from the hive in midsummer and the results were substantially the same. It is evident from these results that the formic acid of honey is not immediately fatal to the blight organism. We believe we have proved that if one bee carries 100,000 bacilli into the hive one day, that on the following one or two days, each of 1,000 bees has the possibility of carrying a considerable fraction of 100 virulent bacilli out to fruit blossoms, because practically all the bees in the hive are at work duirng the night curing the honey. This would seem to go a long way toward explaining the wholesale infection that occurs in the latter part of the blooming period."

WORDS OF WARNING

In the Nova Scotia Provincial Crop Report dated December 1st, 1916, we find the following note of warning:—

"Canker Worms (Alsophila pomotaria), were abundant locally, stripping the leaves from many unsprayed orchards. The adults appeared in countless numbers this autumn, and unless the early poison sprays are thoroughly applied, there will be much loss next season."

"Tussock moths and fall webworms are also on the increase, and the poison should in no case be omitted from the late summer spray next season."

Dairying takes the least fertility off the land.

* * *

Milk is a highly perishable food, and the length of time it will remain sweet and safe, especially for children, depends, the specialists say, almost entirely upon the constant care it receives from cow to consumer.

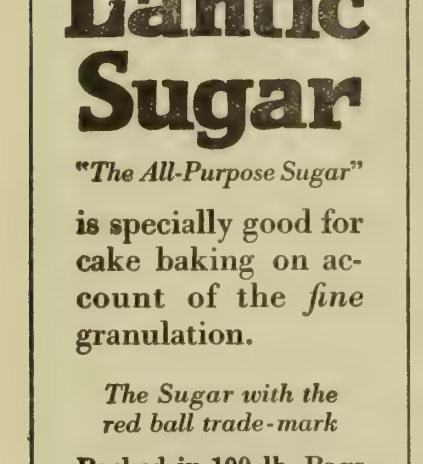
* * *

The cow that gives a gallon of milk a day in the winter and goes dry in the winter is not the profitable kind, especially this winter, when feed is so high priced.

Flattering to the Original

But Imitations Only Disappoint

There are many imitations of this great treatment for coughs, colds, croup, bronchitis and whooping cough. They usually have some sale on the merits of the original, but it should be remembered that they are like it in name only.



This is a facsimile of the package bearing portrait and signature of A. W. Chase, M.D.

DAIRYING.

WHAT TO LOOK FOR IN BUYING COWS

The best way to replenish the dairy herd is by raising the heifer calves. Many cannot, or think they cannot, do this and so resort to buying. There seems to be no cut and dried rules that one can follow in choosing good cows. The skill needed comes from close study and getting quite badly cheated and fooled a number of times. It seems that some man who has a cow to sell is certain she is the best cow ever put on the market. There is something touching in the simplicity with which he parts with his best cow to accommodate the buyer. It is well to be on the guard against these generous gentlemen and while we do not wish to say anything against their integrity, it is advisable to keep in mind the old maxim that it is useless to lock the stable after the horse has been stolen.

In buying cows it is very important to be able to judge their age. This is usually done by examining the horns, provided they have any. Another way to ascertain the age is by examining the teeth. At two years of age the cow has four full grown front teeth with two or more decaying milk teeth. At four years she will have her full set of eight in full size with sharp edges. These sharp edges gradually wear away, and as the wearing approaches the gum, the cow's usefulness declins: It may occur that a cow brought up on a sandy soil will wear her teeth out more and become correspondingly less valuable than one that has been fed in the stall on cut feed.

To the experienced buyer, the eye is a fine indication of the age. There is usiversally a bright fullness to the eye of the young animal that is sadly wanting in those having age. A cow's best milking time is usually from her fourth to her eighth year, when her decline usually begins, the udder showing the first signs of weakness. This is the time many dairymen show their folly. They keep her several years after she ceases to be profitable and then attempt to fatten up the old frame, losing about twice as much in the end as if they had sold her two years before. After a cow has passed her tenth year, her milk as a rule gradually becomes thin, and her place should be filed by a promising young animal. There are exceptions to this, of course, as many experienced dairymen will testify.

Some cows have large, fleshy udders, and fail to give the amount of milk that their size would indicate. Such cows are rare, however, and after all, the size of the udder when it is full of milk, and the cow is fresh, is the best index we have as to the value of the cow. With many buyers, this one point far outweighs all others.

Again, it is considered by some that large, crooked veins running forward of the udder indicate a good cow. In our experience, except with old cows, we have found this sign sometimes unreliable. In fact, we are inclined to believe the size of the veins is more a freak of nature than a necessity, and their display depends upon the thickness of the skin and hair.

D. L.

WHAT IT COSTS TO KEEP A COW

The New Hampshire Experiment Station compiled figures on cost of milk production as obtained from records of the Lyndeboro Cow Testing Association, and from records obtained from other farms, says a correspondent of the Holstein-Friesian Register. It is fully believed, however, that the figures are a conservative estimate on the yearly expenses entering into the production of milk on a dairy farm in New Hampshire. The following is a summary of the cost per cow per year: Cost of feed, $73.03; labor, $32.33; delivery, $7.18; housing, $9.05; depreciation on cow, $8.83; bedding, $4; bull, $3.79; taxes and interest, $4.55; ice, coal and wood for heating, $2.17; veterinary service and medicine, 87 cents; tools, utensils, salt, etc., 53 cents; cow testing association expenses per cow per year, $1.40; total, $147.73. The cow is credited with manure worth $15, and calf worth $3; total $18, leaving cost item of $129.73.

The Massachusetts station compiled similar figures and the cost was substantially the same as those found by the New Hampshire station. The average yearly food cost per cow was $90.04 and the net yearly fixed charges per cow was $56, making a total cost of $146.04. Commenting upon these figures, Prof. Lindsey, of the station, says in Bulletin No. 145: "The figures indicate that the farmers having a superior herd of Jersey grades whose average milk yield is 6,000 pounds per cow, should receive substantially 5.5 cents per quart for it at the farm in order to get a fair market price for his roughage, and $35 per year for his labor, per cow, or $420 for twelve

Then shall the King say unto them on his right hand.....

"I was an hungered, and ye gave me meat; I was thirsty, and ye gave me drink..... naked, and ye clothed me....."

Then shall they answer him, saying—"Lord, when saw we thee an hungered, and fed thee? or thirsty, and gave thee drink? ....or naked, and clothed thee?"

And the King shall answer..... "Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me".

Overseas, in ravaged Belgium, more than 3,000,000 of "the least of these" are hungry, thirsty, thinly clad—looking to us! Have you done what you could for any of them?

WHOOPING COUGH

The Infant's Most Dangerous Disease.

Whooping Cough, although specially a disease of childhood, is by no means confined to that period but may occur at any time of life. It is one of the most dangerous diseases of infancy, and yearly causes more deaths than scarlet fever, typhoid or diphtheria, and is more common in female than in male children.

Whooping Cough starts with sneezing, watering of the eyes, irritation of the throat, feverishness and cough. The coughing attacks occur frequently but are generally more severe at night.

On the first sign of a "whoop," Dr. Wood's Norway Pine Syrup should be administered, and weeks of suffering prevented, as it helps to clear the bronchial tubes of the collected mucous and phlegm.

Mrs. Nellie Barley, Amherst, N.S., writes: "I have much pleasure in saying that there is no cough syrup like Dr. Wood's Norway Pine Syrup. My little girl took whooping cough from a little girl who has since died with it. I tried lots of things but found 'Dr. Wood's' to give the greatest relief. It helped her to raise the phlegm, and she is now better.

My young brother is also taking the cough, and I am getting 'Dr. Wood's' to work again."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper: 3 pine trees the trade-mark; price 25c. and 50c. Refuse substitutes.

S. KERR
Principal

cows. If he had ordinary pasture for his herd, this cost might be slightly reduced. The dry weather of the last few summers has greatly reduced the value of the pasture. Profit other than the sale of roughage is not included, neither is allowance made for cost of supervision. Even if his herd consisted of grade Holsteins, or Ayrshires, it is doubtful if he would find it profitable to sell his milk yield for less, unless the average yearly yield was considerable in excess of the above."

The Connecticut (Storrs) station compiled figures for five years on the college herd composed of Jerseys, Guernseys, Holsteins and Ayrshires. Accurate accounts were kept, not only of the cost of feed, but also of labor and other items of expense. In the five years the average food cost per cow per year was found to be $84.07, and the fixed charges per cow per year, less $15 for value of manure and calf, was $50, making a total cost of $134.07 per cow per year. The average for five years of 124 cows showed that the average cow produced 6,379 pounds of 4.34 per cent milk at a cost of 4.78 cents per quart at the barn.

ABUSING THE COW WASTES THE FEED

Too often we, in this progressive age, talk and write about the best methods used among farmers, forgetting that there still exists (not infrequently either) some common abuses that should be discouraged. Even though the institute lecturers occasionally call the attention of the farmers to the leaks and wastes of the farm, these wastes still abount on every hand.

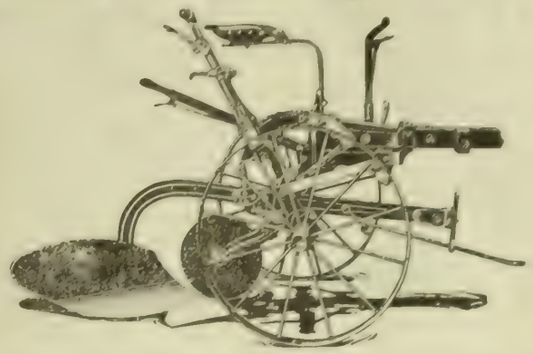
Probably at this time of year the most noticeable abuse and waste is the manner in which dairy cows are stabled and bedded. When riding through the country it is no uncommon sight to see milk cows with both hind legs and often the udder besmeared with dried manure and mud. Frequently the tails hang weighted down with balls of manure and mud caused by cows having to lie with no bedding or insufficient bedding to absorb the moisture of the stable. Such cows never feel a curry comb. As a result after milking the milk is well tainted with the dirt from the udder and the hands of the milker appear as if walnuts were being hulled. In the spring the cows with this negligent care lose the hair on both hind legs and they become as bare as any hide having acid applied to remove the hair.

Yet with the cows stabled in this manner the farmer wonders why the flow of milk is greatly diminished. He is sure that he feeds a sufficient amount of grain and "rough" feed and is positively certain that he has good milkers. Occasionally he remarks that he would not think the matter so strange if the cows were compelled to stand out at nights, braving all kinds of weather. Yet he never suspects his stable floor or bedding.

With a little forethought, expense and time such a farmer could have his cows giving a good flow of milk on the same feed. He could cement his cow stable, raising the main part of the floor sufficiently high to make a trough behind the cows. Under this management much less bedding is required and the shaggy cows with bare legs are unknown. It is much more pleasant to milk in a well-cemented, dry stable than in a wet, soggy stable, for then one does not have to get a fork or straw to scatter about the cow each time he milks.

Like all other manufacturing institutions, the profits of the dairy factory depends upon cost of production.

Hamilton Plows for Long, Hard Service



It takes a real plow to make good with the plowing experts of Eastern Canada. Therefore, we take pride in the fact that the Hamilton No. 126 sulky meets with their approval. Partly because it is adjustable to all conditions, partly because it is easy to operate, but mostly because it is built to do first-class plowing for many years this sulky has made good.

Note the handy pole shift. With it you can instantly change the landing of the beam, straighten crooked furrows, adapt the plow to side hill plowing and to the turning of short corners.

The Hamilton 126 is a two-wheel sulky with a horse lift—a single type that is remarkably easy to operate. The horses do practically all the work, yet the draft of the plow is so light that they do a full day's work with it.

The Hamilton line also includes walking gangs, two-way plows, and a choice assortment of walking plows. All are made with the thoroughness you will find in the 126 sulky. Note the new spring beams and long handles of the walking plows.

Will you please send us your name and address so that we can mail you our Hamilton plow folders? Write to the nearest branch house.

WAS WEAK and RUN DOWN

SUFFERED WITH "NERVES."

Many women become run down and worn out by their household cares and duties never ending, and sooner or later find themselves with shattered nerves and weak hearts.

When the heart becomes weak and the nerves unstrung it is impossible for a woman to look after her household or social duties.

On the first sign of any weakness of either the heart or nerves, take Milburn's Heart and Nerve Pills, and you will find that in a very short time you will become strong and well again.

Mrs. J. A. Williams, Tillsonburg, Ont., writes: "I cannot speak too highly of Milburn's Heart and Nerve Pills. I suffered greatly with my nerves. I was so weak and run down, I could not stand the least excitement of any kind. I believe your Heart and Nerve Pills to be a valuable remedy for all sufferers from nervous trouble."

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

LIVE STOCK.

THE SOLDIER AND THE SHEEP

Crops of Wool and Lambs can be Raised by Men who cannot till the Soil.

"The Soldier and the Hen" was the title of a paragraph published recently describing the way in which soldiers had taken up poultry-raising at some of the Military Hospitals Commission's convalescent homes.

Poultry raising is one of the outdoor occupations available for men too badly disabled for general farm work.

Several kinds of farm work, however, are within the powers of men partially disabled and one of these is sheep-raising.

Mr. J. H. Grisdale, Director of the Dominion Government's Experimental Farm system, has kindly sent the Military Hospitals Commission the following article on "Sheep farming for returned soldiers":—

Agriculturally, Canada is and has been a land of big things. Sheep, however, though great money-makers in many other countries, have received anything but the attention their possibilities well merit in this country, and climatic conditions seem fav-has been proven to include extensive areas highly suitable to the successful pursuit of the sheep-breeding industry, and climatic codnitions seem favourable in practically all parts of the Dominion.

One peculiarity of this industry is its suitability to either fertile or inferior lands. Much money has been made with sheep on farms where no other line of farming could possibly have been followed.

Another peculiarity is that it may be conducted either on a smale scale, earning a satisfactory income, or on a very large scale, building a fortune. The single-handed farmer with his tidy little flock of high grade ewes is sure of a comfortable income while the rancher with his wide scattered flocks and his hired shepherds may be easily on a financial par with the Railway President.

A Most Attractive Line

To the soldiers returning warwearied to peaceful pursuits in this country, in my opinion no single line should prove more attractive than sheep-farming. Even though previously entirely innocent of any knowledge in this connection, one really interested can easily and quickly get into the business. A few months spent where sheep are kept, then a little bit of cheap land, a few nice grade ewes awith a right good ram, and the thing is on its way.

The initial investment is small, the daily labor is light, and the sum of work for the year much less than with most other lines of live stock. Besides, the work is of such a character that great physical strength or robust heath is not essential to success, though these conditions are usually most necessary to farming.

There is plenty of room, there are many farms ready and waiting for thousands of small sheep farmers, in Nova Scotia, New Brunswick, Quebec and Ontario, to say nothing of the prairie provinces and British Columbia.

Anyone at all interested in making a living in this country, with a minimum expenditure in capital and labour, cannot afford to neglect the possibilities of this most attractive industry, for its present returns are most satisfactory, and even when war prices fall there is no reason why its future should not continue to prosper. —By J. H. Grisdale, B. Agr. Director of Experimental Farms.

To Every Woman Who Is In Pain

MRS. WILLIAMS SAYS USE DODD'S KIDNEY PILLS

She Suffered for Two Years, but Three Boxes of Dodd's Kidney Pills Made Her a New Woman.

Adamsville, Kent Co., N. B.—(Special.)—"I can recommend Dodd's Kidney Pills to every woman who suffers." So says Mrs. Williams, a well-known and highly respected lady residing here. Mrs. Williams was a sufferer for two years till she used Dodd's Kidney Pills. She found in them quick relief and complete cure. That is why she is so enthusiastic in her praise of them.

"My troubles started with a cold," Mrs. Williams states. "I never seemed to get over the effects of it. I had cramps in my muscles and my joints were stiff. There were dark circles under my eyes which were puffed and swollen. I had a bitter taste in my mouth and I suffered from severe headaches.

"I felt heavy and sleepy after meals and had attacks of neuralgia. Heart flutterings and rheumatism were soon added to my troubles. I took just three boxes of Dodd's Kidney Pills. I cannot be too glad that I did so."

Every one of Mrs. Williams' symptoms was a symptom of kidney disease. That is why Dodd's Kidney Pills cured her.

MEDICINE CHEST FOR THE LIVE STOCK

A well-equipped medicine chest, skilfully used, often proves the salvation of valuable breeding and work animals.

On farms where livestock is the chief means of revenue the following list of drugs, disinfectants, worm powders, blisters and accessories should be on hand:—

1. Beechwood creosote and camphor for horses suffering from distemper and influenza.
2. Turpentine for bloat in cattle, colic in horses and worms in horses and hogs.
3. Pine tar for colt distemper.
4. Epsom salts as a purgative for cows, sheep and hogs. It should not be given to the horse.
5. Raw linseed oil as a purgative

BISSELL Double Action Harrows will thoroughly cultivate and pulverize any soil.

One Harrow is Out Throw; the other is In Throw. They are simply constructed, rigid and durable. The Gangs are flexible and the Disk Plates are so designed that they "hang" right into the soil. Bissell Harrows are built in sizes and weights suitable for horse or tractor use. Write Dept. M for free catalogue. 98

T. E. BISSELL CO., LTD., Elora, Ont.

On the Job Laying Though Snowed In

Under the most severe weather conditions, you will get plenty of eggs if your hens are properly housed and *fed* Royal Purple Poultry Specific as directed.

Jno. Cutting, Ospringe, Ont., writes as follows:

"Dear Sirs,—Kindly send me your free booklet on Stock and Poultry. I have used your Poultry Specific all winter, and I would not want to be without it. For fattening chickens, and making hens lay it can't be beaten. I have also used the Stock Specific, and find it as represented."

Royal Purple Poultry Specific

In summer, fowl get grain, herbs, grass and insects, which are Nature's assistants for producing eggs. In the winter and spring, fowl get practically the same grain, but must have a substitute for the herbs, insects. Royal Purple Poultry Specific, manufactured from Roots, Herbs, Minerals, etc., is a most perfect substitute, increases the egg production at once, and makes the hens lay as well in winter as summer—keeps the fowl active, vigorous and healthy—prevents chicken cholera and kindred diseases.

Sold in 25 and 50c. packages, also $1.50 and $5.00 air-tight tins. We also manufacture Lice Killer, 25 and 50c. packages; Roupe Cure, 25c.; Disinfectant, 25c., 50c., $1 sizes.

Secure these products from our dealer in your town.

FREE BOOK

Write for FREE 80-page booklet describing all common diseases of stock and poultry. It tells how to build henhouses and how to raise calves without milk.

Secure More Pails of Milk From Your Herd

Royal Purple will increase the flow of milk from 3 to 5 lbs. a day if used according to directions. Mr. Norman C. Charlton, Scott, Sask., states:

"I am from Ontario and fed your Royal Purple Stock Specific when in Brownsville. My cows made the largest average and tested 5 pounds over average at C. M. P., Brownsville. I believe you make the best conditioner on the market."

Royal Purple Stock Specific

The great farm animal conditioner and fattener is used in almost every progressive stock-raiser's stable in Canada. Good for all stock in a run-down condition. Can be used occasionally or continually without showing bad after-effects. Royal Purple Stock Specific is purely a digester and blood purifier. It aids digestion to such an extent as to produce the very best results, and obtain the maximum amount of good from the food eaten. It will enable you to fatten your steers and hogs a month earlier, thereby saving a month's feed and labor.

Mr. Malcolm Gray, of Komoka, states:

"In regard to the feeding of Royal Purple Stock Specific, I had two lots of hogs. To the first lot I fed Royal Purple Stock Specific and when I sold them they averaged 196 lbs. each. On the second lot I did not use Royal Purple Stock Specific, and at the same age they averaged only 150 lbs. each. They were both the same breed and one lot had as good a chance as the other. We have also fed Royal Purple Poultry Specific with excellent results."

Royal Purple Stock Specific is put up in 50c. packages and large $1.50 and $5.00 tins. Secure our products from our dealer in your town. Write for free booklet on how to treat all common diseases of stock and poultry. Tells how to build hen houses and how to raise calves without milk.

THINKER OR DOER, WHICH TYPE ARE YOU?

Someone rightfully says, People can be divided into two main classes, the thinking type, those who plan or plot or map out a true policy of business and the Doer type who put the plans into action—the production end of the business.

Putting Thinkers into jobs that call for the other class of men is like putting round pegs into square holes, misfits—inevitably spells disaster for the business and failure for the men.

Proper direction of your job-selection is included in our Service. It is worth much to you

for the horse.

6. Aloes as a horse purge and for dusting wounds. An animal will not bite a wound covered with aloes.
7. Boric acid and burnt alum as dusting powders and astringents.
8. Castor oil is a purge for foals, lambs, calves and pigs in constipation and diarrhea.
9. Blue vitrol as an antispetic astringent and deodorant.
10. Sweet spirits of niter to reduce fever—given in doses of a half to one ounce.
11. Carbolic acid as an antiseptic in washing wounds, abscesses and fistulas. It is best used in three to five per cent. solutions. It is also given hypodermically for aboration, in doses of ten cubic centimeters of a two per cent solution every ten days to two weeks.
12. Calomel given with santonin for killing worms in horses and hogs. From one to two grains of calomel and a half to two grains of santonin constitute a dose.
13. Blue ointment to fr e cattle from lice.
14. Corrosive sublimate—poison—probably the best and the cheapest antiseptic, used in solution of 1 to 1000 parts of water.
15. Potassium iodine for ringworm and for reducing sprains, capped hocks and elbows and bog spavins.
16. Glauber salts as a mild purge for cattle and horses.
17. Olive oil and vaseline for overcoming inflammation and irritative conditions.
18. Blister for ring-bone, spavins and splints: 1 part red iodide of mercury; 1 part Spanish fly; 8 parts vaseline.
19. Worm powder for horses; 3 ounces iron sulphate; 3 ounces nux vomica; 3 ounces American worm seed; 1 quart linseed oil; 3 ounces turpentine; 1 ounce aloes.
20. Thermometer with pear-shaped bulb and chain.
21. Trocar.
22. Cotton and bandage.

A FEW REASONS FOR OPTIMISM IN THE SHEEP BUSINESS

"The returns are much quicker and larger than from any other kind of live stock. The sale of the wool and lambs will practically bring in the original cost in one year, and at a very small cost and work. It is not necessary to feed them large quantities of high-priced grain but cheap fodder and hay and straw and pasture.

"All other live stock except horses depend on the sale of meat for returns but not so with the sheep, for they have wool which can be grown on sheep only and there is no substitute.

"The only profitable way to fight weeds is with sheep; they make money while they are destroying weeds. When it comes to grain raising no farm is complete without sheep, for they pack the soil, thus preventing drifting, and also fertilize.

"Shep are especially easily handled. It is true there is a little expense in fencing, but not as much as most people suppose. Nearly every farmer has his land or part of it fenced with barbed wire, and it is an easy matter to raise up the lower strands and slip on the woven wire. Then the farmer has a fence that is a fence. it will keep in all kinds of live stock and prevent him from losing valuable horses with wire cuts.

"Sheep raising is especially profitable and the future is very bright, for there is a great world's shortage of wool and mutton, beside there are fewer sheep in Canada and the States than formerly."

HAS NO EQUAL

It not only softens the water but doubles the cleansing power of soap, and makes everything sanitary and wholesome.

REFUSE SUBSTITUTES.

PURE BREDS RETURN MOST PROFIT

A comparison of the yearly incomes of 124 farms where pure-bred bulls were kept at the head of the dairy herd, with 466 dairy farms where a grade bull was used, has been made by the Illinois agricultural college. The average farm income for the first list of farms was $1102 after deducting taxes, interest on investment, etc. Where a grade bull was used the farm income was $734. On 83 farms where scrub bulls were used the farm income was only $243, or only half enough to pay interest on the investment, to say nothing about any pay for the owner's time.

To know what every cow produces during the month and the cost of producing stimulates interest in the cows as individuals and causes the whole family and the hired man to take a new interest in the business.

Is Your Cow a Machine?

THE modern dairy cow is a milk-producing machine. **You** put in the raw material—food. **She** turns out the finished product—milk. The ever-increasing demand for pure, clean, rich milk is responsible for the present necessity for keeping the cow always on the job. To maintain production at top notch it is absolutely necessary to keep the cow in perfect health. A tablespoonful of

THE HORSE

FEED AND THE HORSE

They were an honest pair of live workers and young, but it was with difficulty that the city man was induced to buy them at $150 less than some fat ones. By the following year they had shaped up and made at least $100 from improved condition and efficiency. In the hands of their first owner these horses would never have been worth the money, as he fed as some people coal a stove, by little driblets. Never accumulating a body of fire and heat the stove is always about 50 percent below its potential, and so were his horses. A large fire and an open window looked like waste to this man. Whenever his horses stopped work the grain was withheld. He was a good man from whom to buy horses; they never brought what they were worth; they were never in shape.

A mile away was a farmer whose horses were always ready for the sale-ring when he wanted to dispose of them horse buyers flocked to his place, as there they found the reserve of flesh that is demanded by city buyers. Even farmers would buy horses from him. He had a reputation, entirely fictitious, of owning the best horses. He really kept only the fattest ones. His eye searched out good feeders rather than those with sound bottoms. He made money. He sold people what they wanted, but a real horseman who wanted work stock for use was apt to pass him by.

There is an astonishing number, even of country people, who worship at the shrine of the fat horse, and who somehow never seem to grasp the fact that hay, oats, corn, grooming and fresh air will bring forth flesh and fat no matter who owns a horse. They buy fat and sell thin, if they can find a customer.

The measure of a horse's feed is what it takes to keep it. It is not in a book, but in the horse's capacity for assimilation. Throw away that old tin can that holds 4 quarts and get one that will hold enough at one trip, however much the horse may need. If one buys an auto that consumes more gallons per hundred miles than another, that is unfortunate, but not to be remedied by withholding gasoline.

"Never traveled up with his mate," remarked a farmer of one of his horses, a gaunt, cadaverous animal with room for a pillow between hip and rib. The other was a short, smaller, rather short-stepping chunk. "Do you feed them the same?" he was asked by the man who bought them. "Oh, yes, just the same, always the same," he replied. The new owner applied a different method. He threw in the feed to the emaciated one and in a few months he outwalked the chunk. Having attained enough energy to gather quickly he outstrode the little one. He was a pearl of price.

No man can be happy working ill-matched and unevenly-gaited teams. They are trying to the sweetest disposition. Judicious feeding makes happy days.—L. Ogilvy, in Breeder's Gazette.

WHAT TO USE FOR BEDDING

Straw makes the best absorbent, keeps the animals clean if used abundantly and adds materially to the value of the manure pile. Wheat or oats straw are cheap and abundant on most farms, or easily procured. Rye straw is tougher, can be dried and used several times and for this reason is most desirable for use in horse stables. It is readily salable and in many markets brings nearly as much as good hay.

Swamp hay is fully as good as straw. Leaves absorb water fairly well, add some value to the manure, but do not wear well. They are generally expensive to gather in large quantities. Cut or shredded cornstalks are most excellent, but are generally too valuable as a food to use for bedding.

Shavings and dry sawdust are clean and good absorbents, easy to handle, but in themselves add no value to the manure. Muck and peat, if dry, are very fine absorbents, but are not clean in stables and are expensive to get out and dry. Nothing can be said in favor of sand. It is dirty, a poor absorbent and heavy to handle.

POULTRY.

MEETING OF THE NOVA SCOTIA POULTRY ASSOCIATION

The annual meeting of the above association took place at the Agricultural College, Truro, N. S. on Thursday January 11th, at 7 p. m. The President, Mr. Frank E. Jackson, North Sydney, in the chair.

The minutes of the last annual meeting were read and approved. The delegates reported for the different clubs.

E. H. Dodge reported that their club held a show but were unable to bring out the balance on the right side of the account.

Mr. W. T. Mattinson reported for the Glace Bay Club and stated that their show was held and the balance was $100.00 on the profit side of their account.

Mr. Fred Bath reported for the newly formed club for Annapolis County and stated that they expected to hold the first show this winter and would use every effort to keep the balance on the proper side of the account. It was also their intention to use a band to draw the crowd to the show. He was in favor of giving all assistance possible to the members and their clubs to carry the shows to a successful finish.

Mr. E. E. Frehill, reported for the Egerton Poultry Club of New Glasgow. They had held a show and it was their eighth annual effort. It was hard to get funds enough to run the show but their officers had placed a note in the bank which enabled them to raise the money they needed.

Mr. C. F. Bowes reported for the Halifax Poultry and Pet Stock Club. He stated that it was their intention to hold a show during the coming winter and they had now about seventy valuable special prizes, including several silver cups.

The secretary gave a report of the work done over the province. Ten club shows were held in as many different counties and at all, interest was keen for the prizes. The different shows were revived and some suggestions were given for the improvement of the shows. It was also pointed out that it was not likely that any more assistance would be forthcoming for show purposes for some time.

The President and Mr. Mattinson called the attention of the members to the very unsatisfactory building in which the poultry exhibitors were compelled to show their fowls at the Sydney exhibition. It was moved and carried that the secretary write the Secretary for Agriculture asking that the grants available for poultry at this exhibition be withheld until this building is put into a satisfactory condition or a new one erected for the poultry exhibitors.

Mr. Bath called attention to the resolutions passed last year re standardizing eggs for export and the secretary was instructed to find out what action was taken in this important matter. Several members called attention to the habit of retail dealers displaying eggs in store windows exposed to the sun and it was decided to have the secretary draw up a letter similar to the one used last year calling attention to this oversight and asking merchants and dealers to use display cards and to try and keep the eggs in the coolest place in the store.

After some discussion it was decided to ask the Department of Agriculture at Ottawa and the Director of the Experimental Farms, Ottawa, to put on exhibition, and educational exhibit of poultry and eggs at each and every one of our provincial club shows.

The question of ways and means of carrying on the shows brought out a great deal of discussion. It was decided that the secretary try and get the consent of the new Commissioner for Agriculture to use some of the federal grant to help out the poultry

ONE GOOD TURN

(Continued from last issue)

While Jimmy convalesced in the pretty little room, Judge Gray, being of the newer school of philanthropists which believes in putting the means of subsistence within the reach of everybody, did some "scouting" for the youngster.

He found a paper route where Jimmy could deliver morning and evening editions before and after school. A tiny room was engaged for him under the eaves of Mrs. O'Brien's flat in Rivington Street.

For two dollars per week Jimmy was to have this room and two meals a day, breakfast and supper. His paper route would bring him three dollars and a half per week. A whole dollar and a half for clothes, a little judicious amusement, modest noon-time lunches and other necessities!

The day he donned the new suit of clothing which Miss Granger laid upon the chair beside the bed, his heart swelled almost to the point of being a painful burden. But when he discovered that there were pockets in the suit; all the pockets he could possibly use, before and aft, and in the coat and the trousers, his eyes filled with tears, and he wanted to pray. Perhaps he did pray, in his way, since within him was born a great desire to show his friends in some way how thankful he was for benefits received. For after all, about the best way to pray is through kind acts.

A week passed uneventfully. Jimmy returned to school, and morning and evening he shouldered his bag of papers and delivered them to his customers. Some trouble might have been anticipated from his small school companions who had seen him ignominiously fleeing from the wrath of the coming Ikey Goldberg. But his return was attended by a sartorial brilliance and a wide business scope that dazzled his young associates.

Rivington Street ethics are not so different from those obtaining upon more pretentious thoroughfares of the great city, and success means a looking upward by those below.

Two by two, as the animals are said to have gone into the ark, Jimmy's little friends of the masculine gender were asked to explore the glories of his eyrie under Mrs. O'Brien's eaves. Miss Granger had caused this room to be raised to the "nth" power of cleanliness, and she had made it bright and pretty with rag rugs, cheap chintz and good prints.

With awe the boys would tiptoe in, glance around and remain standing while Jimmy exhibited the plethora of pockets which his new suit possessed. Izzy Rosenbloom voiced radical childish wisdom as he inspected Jimmy appraisingly.

"Yer've got 'from' gold in yer hair, 'n' yer've got white skin 'n' yer eyes is blue. Yer a purty boy. I wonder wot they'd er done to me?"

Izzy inspected his eagle's beak and brown skin in Jimmy's little mirror with intense dissatisfaction.

Unarmed intervention was required to restore peace. Jimmy sensed in Izzy's innuendo a reflection upon the disinterested motives of his friends. The insult to himself he overlooked. "A purty boy" His cheeks glowed with shame.

Before starting upon his rounds in the evening Jimmy always reported to Miss Granger to be "inspected" for he was on probation as the law requires of juvenile offenders.

Came an occasion when he rang the bell of Miss Granger's flat as was his custom. When the little maid-of-all work ushered him into the pretty living-room he found his young patroness lying upon the sofa, her face burrowed into a pillow. Her beautiful hair, which was usually so tidy, was all tumbled.

"Miss Granger, wot's the matter?" he queried, stammeringly, shuffling from one foot to the other.

He had never even dimly suspected that his pretty lady ever cried. It revealed a whole new vista of possibilities to his childish mind.

Miss Granger extracted her face from the pillow. Her cheeks were wet with tears.

"Jimmy, you remember little Elise don't you?"

"Why, yes'm, yes'm."

"She is very ill, Jimmy, and oh, if I had known my own heart better I might have been up there trying to save her, helping to nurse her."

She appeared to have forgotten the boy. Her eyes gazed past him .

"I've taken a terribly restricted view of life, I fear," she murmured, in self-communion.

Two big tears rolled down her white cheeks from which the faint red of the pomegranate had faded.

This was not to be borne. Into Jimmy's mind flashed an idea. He dashed madly out of the flat and almost tumbled over Izzy Rosenbloom. Then and there he bartered with Izzy. For twenty cents, cash in hand, the little Hebrew promised to distribute the evening papers according to the list in the bag.

Jimmy sought the corner drug-store and asked the man to please find the number of Judge Gray's house in the telephone-book. The drug-clerk wrote it upon a card for him. Jimmy seized the pasteboard, dashed out of the place and sought the first elevated station on the Second Avenue line that offered a passage uptown.

It seemed to him that the time was now come when he might be of use to the friends who had done so much for him.

Some of Miss Granger's words had been quite cryptic. But he had understood enough to deduce that Miss Granger would like to help nurse Judge Gray's little girl, but because of "a terribly 'stricted view of life," the jurist would not permit her to do so.

"'Stricted view of life." He repeated the words over and over so that he might not become entangled when he was explaining to the judge what he had heard, and beg of him to remove the embargo from Miss Granger.

Jimmy alighted at Seventy-Second Street. On the way he had conferred with the guard about what direction to take. So he headed straight for Fifth Avenue, running swiftly. Having reached the stately thoroughfare which looked very strange to him, so dimly lighted it was, and deserted, he searched for the number, and after two attempts found it.

It was a big graystone house. The boy's heart thumped with fear at such grandeur. But he clambered up the stone steps and firmly pressed the button.

The door opened and a pompous individual appeared. Two rows of silver buttons decorated the front of his coat. Two little tufts of hair smugly decorated his cheeks, and his hair was severely divided by a white line which began at his forehead and disappeared somewhere at the rear.

"I want to see Judge Gray," piped Jimmy, bravely.

"'Ave you a message or a parcel, or somethink?"

"No, I just want to see 'im; I've gotta see 'im."

But the man had impressively closed the door in his face.

The boy's unpreparedness for such tactics was equaled only by his resultant determination. He sat down upon the stone step and waited.

For an hour he was unmolested. Then one of his blue-coated and brass-buttoned enemies happened by and roughly advised him to get a move on.

He moved on, but when the "copper" had passed from sight he oscillated back again. He grew cold and hungry, and after a time he slept. His last drowsy thought was that he must remain by his post until the message from Miss Granger was delivered to Judge Gray. He wondered, too, how the little girl was. He hoped she was not going to die, as Sam had done. It seemed terrible to die.

The policeman wakened him by shaking him until his freckles rattled. Like Mike, this bluecoat was a Milesian.

"W'at yez doin' here anyway, youngun?" he asked.

"I want to see Judge Gray; I gotta see him," drowsily murmured the boy.

"There's but one place ye can see 'im," replied the officer, with heavy sarcasm, "an' thot's where the likes av yez is allus seein' 'im, which is the court."

Jimmy blinked.

"Take me to jail then, 'cause I got to see 'im."

"No charge," grinned the officer.

Jimmy was wise. So he made a charge. He did it deftly with his head that was covered with "from" golden-brown hair. Said crown landed neatly into the peace-guardian's breathing-station and made him very cross.

Jimmy got into the station-house in a trice. The next morning found him red-eyed and disheveled, again standing before Judge Gray. The jurist's brow, was clearer this morning. During the night his little daughter had won her fight with death.

The judge looked down and recognized the little culprit. His eyes widened with concern.

"Why, Jimmy!"

The jurist's voice was stern. He had possessed so much faith in the parole system—and in Jimmy.

"What's the charge, officer?"

"He was settin' on yer door-sthep like a hen, yer honor, sayin' he must be afther seein' ye. An' whin I told 'im where the likes 'av 'im was mosht likely to see yez, he near knocked the wind from me wid a butt in the stomach."

"Come here, little man," invited the judge, patiently. "What was it you wished to see me about?"

The boy eyed the judge frankly.

"I got somethin' to tell ye. I got to stand by my friends w'at stand by me, if I do go to jail."

Then he explained. He was voluble, illuminating, inspiring. He played up the tears that had coursed down Miss Granger's face. He gave her a recommendation as a nurse that would have landed her in any hospital. He remembered the very words with which she had bemoaned her "stricted view of life." He pleaded for her with all the untutored eloquence of his warm young years. He gazed with grave reproof and accusation upon this jurist who had declared some embargo upon her. As an almoner of Cupid, Jimmy was a distince success.

All at once court was abruptly if temporarily suspended. An emissary was dispatched. Miss Granger was asked to come to Judge Gray's private room immediately.

And as Jimmy, surnamed by courtesy Epstein, waited philosophically outside in the courtroom for sentence to be passed upon him, within the little room Judge Gray was holding very close to the judicial robe a slender, graceful figure. Two yielding lips upraised to his own were of the color of the heart of the pomegranate.

WHOOPING COUGH.

Every Mother should know that

VENO'S IS A SURE AND SAFE CURE.

No cough sufferer can fail to benefit from the use of Veno's Lightning Cough Cure. In Whooping Cough its quick, sure relief is something to wonder at. The child gets relief almost at once and as the treatment is continued the attacks become less violent and less frequent till they cease altogether. Never believe that Whooping Cough must run its course. Use Veno's, and you will know that it can be cured at any time. Being free from dope, it is absolutely safe. Prices 30 cents and 60 cents, from druggists and stores throughout Canada.

Fertilizer Quality

When you buy a ton of fertilizer remember you are buying what is in the goods and not merely two thousand pounds.

When a smelter buys a ton of gold ore he insists on knowing the number of ounces of gold it contains, and you should know the amount of active Nitrogen, Nitrate of Soda, the gold of the fertilizer.

DR. WILLIAM S. MYERS
25 Madison Avenue, New York

ANNUAL CONVENTION OF N. S. FARMERS' ASSOCIATION

(Continued from page 232)

omics and Development. The views of the Directors were obtained through correspondence. These views were tabulated by Professor Cumming and used as part of his evidence.

A full meeting of the Directors was held at Halifax on Sept. 15. At this meeting the programme was roughly outlined, recommendations were made as to speakers etc., and a committee consisting of the Secretary, the President and Professor Cumming was appointed to complete the programme at the short course or just before the annual meeting.

In as much as the value of the Annual Report depends in some degree on its being in the hands of the members and others interested at as early a date as possible after each annual meeting, we urge that the report be printed annually and distributed if possible before the end of March in each year.

We also desire to record our protest against the increasing menace to decency and morality of the midway attractions at the Halifax Exhibition and recommend that the matter be fully discussed at this meeting with a view to improving this condition.

We also recommend, in view of the strong pressure being executed in some quarters to allow the importation and manufacture of Oleomargerine, that this Association record its satisfaction with existing legislation, and deplores any change in the law which would bring this product into competitive sale with pure butter.

Our program is replete with subjects of vital interest to the Nova Scotia farmer.

We hope every one here will feel that these discussions are free and that we will get the opinion of most of our delegates. Now that the election is safely passel we hope that our resolutions will receive the best attention of the Legislature, and that the farmer will have his wants increasingly considered by our law makers.

The Financial Statement

duly audited was distributed in printed form by the Secretary-Treasurer. It showed a substantial balance to the credit of the Association.

Report of Legislative Committee

To the President and Members of the Nova Scotia Farmers Association.

We your Legislative Committee beg to submit the folowing report: We were most cordially received by the Committee on Agriculture and by the Committee on Law Amendments; we were also asked to address the House on the question of having the Nova Scotia Temperance Act, apply to the city of Halifax.

The following resolutions were presented to the Committee on Agriculture:

1. The resolution as passed by the Farmers Association asking that by the year 1920, the use of broad tires be made compulsory on teams hauling proportionately heavy loads. A scale was worked out regulating the width of tire by the size of the axle. The Committee assured us that this matter would have their most careful attention.

2. We again this year urged upon the Committee the necessity of passing a law prohibiting the use of barbed wire in the building of line fences. We found some opposition from some of the members but the majority were strongly in favor of such a law being enacted.

3. We asked for the appointment of an Inspector of all stallions standing for service, and that such inspection be compulsory, and the owner be compelled to have the result of such inspection printed for the information of the public. The Committee was of the opinion that as this meant the appointment of a salaried official, the matter be deferred for another year.

4. The resolution asking for the cancellation of liquor licenses in the city of Halifax, was presented to the House, the result of which you all know, to your sorrow.

5. The resolution with regard to the "fakir element" at the Provincial Exhibition was presented to Mr. Hall, the secretary of the Exhibition Commission, requesting him to bring it before the Commission.

6. The resolution with reference to petitioning the Dominion Government to remove the duties on Commercial Fertilizers, was on request left in the hands of Prof. Cumming.

All of which is respectfully submitted.

WM. O'BRIEN,
W. W. BLACK,
Legislative Committee.

The foregoing report was received and the committee authorized to again press the various requests of the Association, so that something more definite may result.

Agricultural Societies and Association

Mr. F. L. Fuller submitted his report as Director of Agricultural Associations. There are 10,523 members of Agricultural Societies in Nova Scotia, a gain of 208 members during the year. The Director suggested that the date for holding annual meetings of Agricultural Societies be changed to one month earlier, so that secretaries will have ample time to send in their completed reports.

He also suggested that changes be made in the prize lists of some of the smaller exhibitions, so as to give a better competition that will prove more educative to the exhibitor and visitor.

One of the changes would embody the showing of all grade dairy cattle in one class, instead of in four classes as at present. This would give more competition in each section of the class and give the judge a chance to show by his placings the best types to breed. As conducted at pres nt there is very little chance to show the desirable characteristics as frequently, where the competition is restricted, the prize winners are not of a desirable type. The monies paid out in the four classes would be totalled for the one new class and the number of prizes extended according to the number of entries in the competition.

He would also like to see a change in the prize lists for potatoes, so that instead of having fifteen or more named varieties, there would be prizes for rose type; round white types, long white type and any dark skinned variety. This is desirable owing to the fact that he so often finds one variety

of potatoes brought in under two or three different names.

The 1916 exhibitions showed gains all around. Mr. Fuller was authorixed to draft a prize list and submit it to the managers of the various agricultural societies concerned for their consideration.

In regard to the suppression of the scrub size, Mr. Fuller said any desired legislation in regard to it may be procured as soon as it is wanted badly enough. His advice was for every farmer who wanted such a piece of legislation to write his representative at Halifax to that extent and results would surely come. Such procedure was much better than the petition system.

Equitable Assessment

was the subject of the following paper read by Wm. Murray, vice-president of the Association.

Mr. President and members of the N. S. F. A.

The subject the Program Committee has allotted to me to open up, is one in which I know you are all interested. The equitable assessment of farm property is one which touches us all where we are tender. I realize that there is not a member of this Association who is not perfectly willing to pay his taxes when his property is justly assessed, but under our present assessment law we all find that quite often there are many abuses which might reasonably be avoided.

It always appeared to me as if the present law was enacted to give a bonus to shiftlessness or laziness and to punish energy and efficiency. You all have the different types of farmers in your sections. One type lets everything about his place go without any care as long as possible and his place presents a dilapidated appearance. Buildings without paint, fences tumbled down and the road side filled with stones and covered with weeds. He spends the time that would improve the appearance of his holding, either talking politics with the passers by or driving to the town or village a number of times each week, when one trip a month might do all his business.

The other type is a hustler, attends to his business, has his buildings painted up in good shape, everything about the place shows that he is on the job six days a week. His real estate may not be any better than his neighbors, but he at least makes it look better.

Well, what is the result as regards the assessment of these properties?

Well, speaking for my county at least, the man who lets everything go to wreck and is a deficit to his district, he gets a bonus for doing so by being assessed for as little as possible, while the man who keeps things in shape and has his place so that it is attractive to look at, gets punished for being an **asset**, a progressive citizen in his community, by having to pay probably near twice as much as his neighbour who owns as much real estate as he does and probably is making just as much money of his holding.

It certainly looks to me like the landlord law in Ireland, when if the tenant improved his holding he had to pay higher rent for it next year.

Then the vacant farm is held by its owner, owing to it being assesed so low that he does not mind paying the taxes on it, whereas if it was assessed as high as if occupied it would be sold to some one who would improve it and keep the weeds from going to seed and blowing over the adjoining farms. Also. it would be payng its share of school taxes and doing road work.

Now you may say that it is always easy enough to find fault with existing conditions, but how about a remedy. Well, my remedy for the present assessment law would be a single tax and that on the real estate. Encourage improvements instead of discouraging them, and vacant farms pay as much if not more taxes, than the adjoining ones.

I would also say that it would be an improvement on present conditions if real estate was assesed at or near its value, so as to be something of a guide to parties looking for farms to buy. When a farm is assessed at one half or one quarter of what an owner asks for it, a purchaser thinks there is a nigger in the wood pile if he has come from a part of the world where things are assessed at about their real value. Of course the percentage could be reduced so the taxes would not be higher than they are by the present system.

Listen to what Mayor Taylor of Vancouver says:—"The city of Van-"couver, like many individuals, has "had to curtail its expenditures in "every direction, but notwithstanding "this, when the council brought down "the estimate for the current year, "and struck the tax rate, the resolu-"tion to exempt improvements car-"ried for the sixth time without a "dissenting note. This fact should be "sufficient to counteract any reports "that Vancouver has suffered because "of the single tax method. Every mu-"nicipality except two in British Col-"umbia exempts improvements; the "British Columbia government does "the same and imposes a wild land "tax. The last legislature passed a "measure which comes into effect "within five years, to raise all reven-"ues of the province from land and "natural resources, and retains only "one other tax, that on incomes, "which are exempt up to $1,500."

I think that I will not say any thing

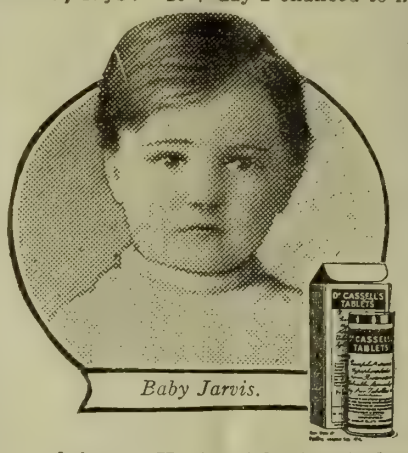
Fine, Bonny Little Boy

Penetang (Ontario) Child, Once so Thin and Delicate, Cured by Dr. Cassell's Tablets.

MRS. JARVIS, BOX 286, PENETANG, P.O., ONTARIO, says: "It is a pleasure to write and tell you what Dr. Cassell's Tablets have done for my baby. When only five months old he was taken ill. I had medical advice for him, and was told he had colic, for which he was treated, but he did not get any better, only worse. I tried several special foods, but none of them would stay on his stomach, and he became so thin that he seemed just skin and bone. He only weighed ten pounds. We never thought poor baby could live, but one day I chanced to hear of a baby's case almost like mine, that had been cured by Dr. Cassell's Tablets, so I got some for my baby, and I am thankful I did. After a few doses the nervous jumps he had suffered from stopped, and soon he was almost well. I have given him the Tablets during teething, and find them very soothing. He is a bonny boy now, quite cured, and weighs twenty-five pounds at twelve months old."



Baby Jarvis.

Every mother should know that Dr. Cassell's Tablets are just as suitable for children as they are for grown-up people. Their splendid nutritive and vitalising properties soon overcome any tendency to nervousness or weakness in the little ones, and lay the foundation of a strong constitution for after years.

Dr. Cassell's Tablets

Sole Proprietors: Dr. Cassell's Co., Ltd., Manchester, Eng.

more on this subject, as there are many of you who can handle the subject better than I can, so I will leave it in your hands and I hope that it will be thoroughly discussed.

Wednesday Afternoon

Immediately after lunch on Wednesday afternoon the delegates were taken to the Experimental Farm, Nappan, on a train provided by Superintendent W. W. Baird. The various farmers found much to interest them in the stables and barns as Mr. Baird hurriedly related the nature of the various experiments which he is conducting in the feeding of beef steers, and the upbuilding of a grade dairy herd. The bunch of steers that is being wintered in an open shed with paddock attached, interested many and gave some of those who have a lot of feed but who are cramped for stable room an idea whereby they may utilize feed profitably in coming seasons.

The visit to the experimental farm occupied about two hours, after which all hands repaired to the usual place of meeting, where the next number on the programme was the Report of the Co-operation Committee appointed at last annual meeting.

Report on Co-operative Movement.

Your Committee on Co-operation appointed at the last annual meeting beg to report as follows.

Shortly after the last annual meeting of the Association, arrangements were made by your Committee to meet the representatives of the United Fruit Companies. The meeting took place at the Halifax Hotel and was attended by the General Manager of the United Fruit Companies and a number of his directors, also Prof. Cumming, Prof. Trueman and F. L. Fuller and your Committee. The Basis of Cooperation between the United Fruit Companies and other co-operative bodies throughout the Province was discussed at length, and the decision arrived at that for the ensuing year organization work be done throughout the Province, and that the question of amalgamating with, or becoming susidiary Companies to the United Fruit Companies be left over until the next annual meeting. The United Fruit Companies expressed their willingness in the meantime to sell to the Co-operative Companies throughout the Province, and agreed to submit their prices in confidence to some one appointed by your Committee, who if he was satisfied with them would make arrangements whereby Co-operative Companies organized, and those being organized, would secure their supplies for the ensuing year. Your Committee arranged with Mr. F. L. Fuller to investigate the prices, terms, conditions, etc.

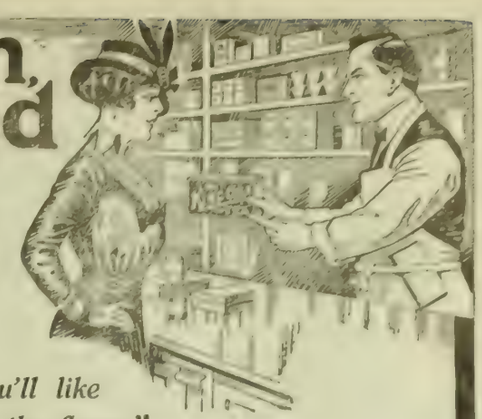
Mr. Fuller investigated the prices and completed arrangements whereby a large number of societies benefited.

Your Committee then took up the matter of organization throughout the Province with Mr. Fuller and decided to send a speaker to any part of the Province where sufficient interest was manifest to warrant the necessary expenditure.

Arrangements were made with Rev. Mr. Shaw, of Berwick, one of your Committee to do this work. On his first tour, Mr. Shaw addressed meetings at Nappan, Stellerton, Antigonish, Port Hood and Inverness.

A subsequent meeting at Stellerton was addressed by the Gen. Manager of the United Fruit Companies, Mr. A. E. McMahon, and at a later date a meeting at Stellerton was addressed by Mr. F. L. Fuller, Mr. G. E. O'Brien of the Live Stock Branch, and the Chairman of your Committee. Recently meetings were addressed at the following places by Rev. Mr. Shaw at Port Hood, Judeque, Inverness, Christmas Island, five meetings in Antigonish Co. and two in Pictou Co. and one in Halifax Co.

This, Madam, is Guaranteed



The good storekeeper always talks *Guaranteed Goods.* He knows that they stand in a class of their own; that they are DEPENDABLE, and that he can sell them without hesitation.

"You'll like the flavor"

The result of this organization work cannot yet be properly gauged, but on account of this work the interest in cooperation has become keen in many new districts, and in places where they had already been doing some work along this line, they have received an impetus and are now forging ahead. Pictou County is being thoroughly organized, and already they have done considerable business. The Pictou Co. United Farmers Limited, bids fair to become a powerful organization, as nearly every district in the County are getting into line. The Antigonish United Farmers Limited while not yet thoroughly organized have done considerable business; during the past year they purchased over $14,000.00 worth of feeds, flour and fertilizer, and during the same time they marketed farm products to the value of over $20.000.00. Port Hood and Christmas Island have done quite a large amount of business during the year, other places in the Provinces are also getting into line.

Your Committee finds that some Co-operative Societies are selling to their members and others at prices that leave no profit on the business. We believe that this practice should be discouraged, and that all Cooperative Societies should charge reasonable profit on all goods handled by them, at the end of the years business the surplus can be paid to them in the form of dividends; by following this method societies will not encounter the same amount of antagonism as if they supply their members with goods at cost.

Your Committee is indebted to Mr. F. L. Fuller for his untiring interest in their work, all arrangements for meetings were made by him, a large number of which he attended personally.

A. S. MacMILLAN.
H. S. SHAW.
WALLACE RHODENIZER.

Mr. MacMillan was of the opinion that co-operative stores should sell at a profit so as not to antagonise men who are conducting stores and other lines of business, and return the profits to the members in the form of dividends.

Mr. H. S. Shaw who carried on the work of organization during the past year, related the enthusiasm with which sections already organized are going ahead with the work. Pictou County is well organized. Rev. Father McDonald, Christmas Island, has a strong organization in his parish.

Dealers need not be unduly alarmed over co-operation. There is room for both the dealer and the Co-Operative Society.

He then introduced a resolution that legislation be asked for the purpose of organizing a central body through which purchases for the district organizations may be made.

After considerable discussion the resolution was adopted.

Dr. J. A. Sinclair addressed the meeting of The Health of the Horse. The number of questions asked showed that the subject was a popular one. It was nearly 7 o'clock before the genial doctor got away for supper.

On Wednesday Evening

The Exhibition Committee submitted their annual report as follows:

Exhibition Commissioner's Report

Mr. President and Gentlemen:

We your representatives on the Halifax Provincial Exhibition Commission, beg to submit to you the following report.

Taking every thing into consideration, war conditions and such, we believe the Exhibition of 1916, as good as any yet held. About every department made a good showing, there were sufficient entries in about every department for to tax the space, but, owing to shortage of help, very many that would have shown their stock were compelled to stay at home to harvest their crops.

The smallest showings were in the Fisheries, Swine and Horses, in the order named. It is always difficult to get a good fish exhibit, and this ought not to be so, for it is one of our important industries.

Owing to the high prices received for pork possibly accounts for that exhibit being so small. Horses were also cut in small numbers, but the quality was good.

The exhibit of sheep was small but quality was good. However we believe owing to the high price that wool and mutton now demands this industry will take on a great boom and will again rank high among the live stock of this province.

The cattle barns were well filled with the usual quality seen there. We noticed the keen interest visitors took in the judging, where it sometimes was very difficult to tell just which animal should carry off the red.

The poultry building was taxed to the limit, being constantly filled with visitors showing the increased interest taken in the hen that lays the silvery if not the golden egg.

Transportation worked against us, particularly in the manufacturers' building, where exhibitors who had booked space, found at the last moment it was impossible to get their goods there.

The exhibit of automobiles in the annex crowded this building to its capaeity, and in some cases, applicants who applied for space were not able to get it, or had to cut down their exhibit. No doubt this will be a larger exhibit in the future, and more space will have to be provided.

The Fine Arts and Mines buildings were about the same as usual, there being a few new features by way of munitions Car Axles, etc., in mines building.

The Horticultural display was about as formerly. The Agricultural building had a good showing of roots,

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters: I will explain a simple home treatment which speedily and effectually dispels green-sickness, pimples, irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Windsor, Ontario

vegetables, grain, etc. Also a fine exhibit of wool put on by the Dominion Branch of Agriculture, attracted considerable attention.

The greatest interest was shown in the Women's Institute Department, under the supervision of Miss Jennie Fraser, ably assisted by Miss McGuire, of Lunenburg. The display of home-made mats, carpets, quilts, tablecloths, towels, etc., which were nearly all made by the industrious women of Lunenburg County, was an eye-opener to many in whose home districts this line of home craft is practically a lost art.

Another very attractive exhibit was that of the Creamery and Dairy show, under the management of W. A. MacKay, superintendent of Creameries for Nova Scotia, and M. Harvey Mitchell of the Dominion Dairy Department.

There was a neat creamery, where butter-making was demonstrated at certain hours, and where the product, butter and butter-milk was sold to the public. There were the latest and most up to date appliances for Creameries and Dairy's to be found. These gentlemen have done wonders for the farmers of this province.

Mr. Mitchell, has been the means of getting the farmers to have their herds tested, enabling them to locate the poorest cows, which are turned off for beef, then replaced by better ones. Mr. MacKay has so stimulated the creamery business, that the numbers have increased from 6 creameries in 1909 producing 200,000 lbs. butter per year, until we now have 21 creameries making nearly 2,000,000 lbs. annually.

The midway came in for its usual criticism, much of which was justifiable, but, we have the assurance from Mgr. Hall, that it was not intentional, that anything of a gambling or immoral nature should get in to the grounds, and as soon as they were discovered were closed up and that in the future will be entirely cut out and nothing but good clean, amusing features allowed.

The horse-racing was the best yet, reflecting great credit to the sup't. of that Department, Mr. J. A. Fraser, who has the tact and ability to carry that sport through without a hitch, and to the entire satisfaction of all the horsemen.

We are proud to say our accounts came nearer a balance than ever before, and had we not been obliged to put a new roof on the Annex, which on account of heavy fall of snow last winter collapsed costing $1000.00 to repair it, also, an entirely new lighting system was installed costing over $700. Had not this amount been charged to this years expenses, our deficit would have been little more than $2000.00 instead of $3,982.00 which, I think you will agree is a very modest sum considering the fact we have no grant to work on.

Thanking you Mr. President and Gentlemen for the confidence placed in us, we are,

Yours truly,
F. W. FOSTER,
H. S. KENNEDY.

(Continued next issue)

BUTTER AND CHEESE FOR NEWFOUNDLAND

Mr. W. R. Nicholson, Canadian Trade Commissioner in Newfoundland, writes: "Although there are four butterine factories in operation in Newfoundland, the colony imported in the year 1915, 538,674 pounds of butter and 314,080 pounds of cheese, valued at $202,787. While Canada's share of this trade was fairly large, amounting to $167,326, indicating a decided preference for Canadian dairy products, there still remained $35,461 worth supplied by other countries which it is thought could by a little further effort on the part of Canadian dealers be supplied by the Dominion."

Owing to the proximity of the Maritime Provinces to the Ancient colony, there is no reason why our dairymen should not succeed in capturing the Newfoundland butter trade if they will put up the quality required.

Steamers ply between Halifax and St. John's, and also between North Sydney and Port Au Basque, so that the shipping facilities are good.

BLISTERING STIFLE JOINT

Is it advisable to blister colt that has had its stifle out for more than stage in which ossification has begun. Use a good smart blister well rubbed in after the soreness has been taken out by hot baths. The blister is made up as follows: ½ oz. powdered cantharides, 2 oz. lard mixed. a year?—Horseman, Pictou Co., N. S.

Ans.—If your colt's stifle joint is not still out or dislocated, it will perhaps aid to heal it if blistered. Do not blister if the stifle is out; get the patilla replaced before you blister the joint.

OVERFAT IN THE EGG-BOUND LAYER

Very few persons are familiar with egg-bound. Even some poultry breeders who have had years of experience do not know the real cause or how to treat the trouble. The condition usually appears during the winter, and more deaths from it result at that time of year than at any other. This is because the birds are shut up in winter quarters, where they cannot get proper exercise.

Egg-bound is caused by the bird's being over fat; if it is made to take the proper amount of exercise it will not be subject to this trouble. Do not overfeed! This egg-bound condition is more common in the larger breeds, such as the Asiatics, than in the Leghorn and other small breeds. Also we seldom find a pullet with this trouble. Old hens are subject to it just at the time they lay their first eggs in winter.

This over-fat condition may act in different ways to prevent the eggs being laid. I have seen the fat present in such large quantities that it would collect at the lower end of the abdominal cavity and prevent the egg from being passed. Also it will cause the walls of the muscles of the egg passages to become weakened and give way, permitting the egg or its contents to pass into the abdomen. This is brought about while the bird is trying to expel the egg. When it takes place inflammation will develop in the abdominal cavity and the bird will not live long.

You con usually distinguish the egg-bound bird in the flock. Her wings will be drooped and she will move with little energy, refusing to eat. You can also see the bird go on the nest in an effort to lay; she may make a dozen trips to the nest in one day. Her comb will become pale and her general appearance will be bad.

In treating these cases the first and most important thing is to locate the main cause, for other members of your flock are liable to get into the same condition later. In mild cases, and when you find the sick bird in the early stages, if you will inject a small quantity of sweet oil into the vent this will usually be found helpful in assisting the bird to pass the egg. Also give the bird a small dose of castor oil by the mouth. If after a few hours you do not get results, relax the muscles of the vent by holding the bird over a steaming kettle or jug filled with boiling water, for at least thirty minutes.

If this does not bring results you may as well kill the bird, for the egg has probably passed into the abdominal cavity and death is sure to follow.

Section 4—Wheat, any other named variety—1st, W. H. Venning, Sussex; 2nd, Francois O. Richard, McLeod's Mills; 3rd, Jean M. O. Richard, Mclead's Mills; 4th, Donald Innes, Tobique River; 5th, C. E. Barnett, Hartland.

Good for the whole family

A good cough remedy is one that can be depended upon to cure coughs. Not one that cures some particular cough, but coughs in general.

While the causes of all coughs are primarily the same, yet the condition of the patient is what makes the difference in the nature of the cough itself. Coughs of healthy persons are easier to cure than the coughs of invalids. The more powerful convulsive cough of a big man is harder to cure than the cough of a baby. If you get a remedy that will cure a big man's cough and yet not be too powerful for the baby, you have a good cough remedy.

Chamberlain's Cough Remedy

"Granny" Chamberlain

is just this kind of remedy. It is good for any member of the family. It relieves coughs of all kinds. It is composed of things which cure easily and soothingly without harming the delicate tissues of the throat, and is the ideal remedy for coughs, colds, croup, influenza and whooping cough.

Yours for Health —Granny Chamberlain.

31

Quite likely you've heard of the deservedly-popular

"York" Turnip Pulper

or Root Cutter or Feed Cutter

Well, we make it and find that IT SATIFIES. And it's merits are known not ONLY in our native New Brunswick.

If you have a good Turnip-Pulper perhaps you need a PIG-TROUGH (Cast Iron) ,or a Feed-Boiler, or a Cast Iron Grain Box, or a Griddle, or a Frying-Pan, or a Plain but Serviceable STOVE, or a Horse-Weight or two, or an Iron Pot, or WHAT NOT in CAST or WROUGHT IRON or CAST BRASS.

We are sole manufacturers of the "Dunbar" Shingle Machine, "Superior" Lath Machine, "Smith" Sapper, and "O. K." Cedar Cutoff.

The "Live a Little Longer" Idea

IN Rochester, N.Y., there has been formed an association the object of which is to promote the "Live a Little Longer" idea. It aims to encourage men and women to give attention to their health, and by preventive methods to avoid serious disease and add years of happiness to their lives.

This idea is suited to people of all ages, but seems particularly applicable to persons of advancing years who feel their vitality on the wane. It is truly wonderful what is accomplished by Dr. Chase's Nerve Food under these circumstances.

By forming new, rich blood, and nourishing the starved, wasted nerve cells, it instils new life and vigor into the vital organs and enables them to perform their natural functions.

This means new strength and comfort, freedom from pain and disease, and longer life. This letter gives you some idea what old people may expect from the use of Dr. Chase's Nerve Food.

Mrs. Sophia Baker, Tancook Island, Lunenburg Co., N.S., writes :—"I have been reading about people who have been cured by Dr. Chase's medines, and as I have obtained great benefit from the use of Dr. Chase's Nerve Food I want to tell you my experience. I am an old woman of 80 years. My sleep was very poor, I could not eat anything, and my nerves were in a bad state. Hearing about the Nerve Food, I decided to use it, and must say that the five boxes I took helped me wonderfully. I never expect to be like I was at 50, but this treatment has helped me to sleep well, improved the appetite and built up the nerves. Anyone who wishes can write to me for full particulars.

50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Do not be talked into accepting a substitute. Imitations disappoint.

531

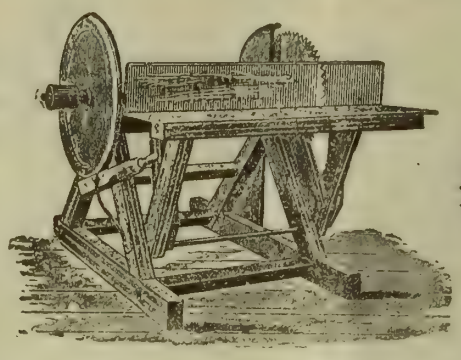
Sussex Wood Cutters Cut Expenses

Consult Our Quality Line Before Buying



Short Swing Wood Cutter

Wood Cutter Saws guaranteed at the right price. All sizes. Prompt delivery.

Flat Roller Table.

CONVENIENCE **ECONOMY** **DURABILITY**

are the three money-making qualities embodied in our Wood Cutting Machines. No frail parts to give out in a season's use. Built to last a life time. Frame is made of well seasoned birch, bolted and mortised; table of heavy steel plating in one piece.

Swing Table Machines built on skids, bearings supplied with compression greese cups. Especially adapted for use with gasoline engines. Made in four styles—Long Swing, Long Swing Improved, Short Swing, Flat Table.

Ask for our Catalogue and Prices, it will pay you.

Remember we also manufacture Trenholm Gear Hay Presses, Grain Grinders, Root Pulpers, Feed Boilers, etc.

The Sussex Manufacturing Company, Limited, Sussex. N. B.

MEETING OF THE NOVA SCOTIA POULTRY ASSOCIATION

(Continued from page 238)

show's prize list.

Mr. Bath, Mr. Bowes and others suggested that it would be a good idea to consider ways and means of providing funds to start a laying contest in the near future. It was decided that owing to war conditions, not to press a claim for this work, but to gather material re these contests for next meeting and then to give the matter more consideration.

It was moved and passed that the secretary write the clubs two months before the meeting is held in order that a discussion may be held and a delegate be elected to attend the annual meeting.

Professor M. Cumming, Secretary for Agriculture, addressed the meeting briefly and stated he was in accord with the objects of the Association. He made several inquiries re the conducting of the laying contest work and suggested that plans be submitted to the Department when completed for this work.

The election of officers resulted as follows:—

President—Mr. Fred Bath, Bridgetown; Vice-President—Mr. E. E. Freehill, New Glasgow.

Executive Committee:—W. F. Mattinson, Glace Bay; Frank E. Jackson, North Sydney; C. F. Bowes, Halifax; W. W. Osbourne, New Glasgow; H. M. Pettet, Yarmouth; Thos. McDonald, Antigonish.

Secretary-Treasurer—J. P. Landry, Truro, N. S.

TO INVESTORS

THOSE WHO, FROM TIME TO TIME, HAVE FUNDS REQUIRING INVESTMENT MAY PURCHASE AT PAR

DOMINION OF CANADA DEBENTURE STOCK

IN SUMS OF **$500** OR ANY MULTIPLE THEREOF.

Principal repayable 1st October, 1919.

Interest payable half-yearly, 1st April and 1st October by cheque (free of exchange at any chartered Bank in Canada) at the rate of five per cent per annum from the date of purchase.

Holders of this stock will have the privilege of surrendering at par and accrued interest, as the equivalent of cash, in payment of any allotment made under any future war loan issue in Canada other than an issue of Treasury Bills or other like short date security.

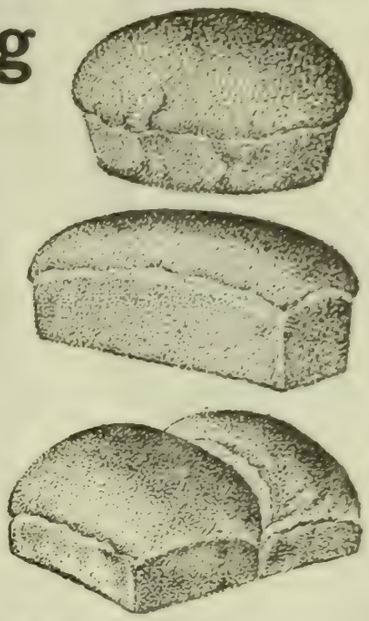
Proceeds of this stock are for war purposes only.

A commission of one-quarter of one per cent will be allowed to recognized bond and stock brokers on allotments made in respect of applications for this stock which bear their stamp.

For application forms apply to the Deputy Minister of Finance, Ottawa.

DEPARTMENT OF FINANCE, OTTAWA,
OCTOBER 7th, 1916.

This woman's experience will help you with your breadmaking



She writes: "My grocer told me to get Cream of the West flour for bread—he could recommend it. It makes bread white and light, so now I won't have any other." A flour so satisfactory that it deserves such praise from those who actually use it is well worth trying. Women everywhere who use it, recommend

Cream of the West Flour

the hard wheat flour that is guaranteed for bread

Give it a trial. See for yourself how splendidly it makes bread that rises right up out of the pans. Cream of the West flour is rich in gluten. This highly nutritious substance has such wonderful elasticity or power of expansion that it imprisons the gas developed by the yeast, thus enabling your bread to rise properly.

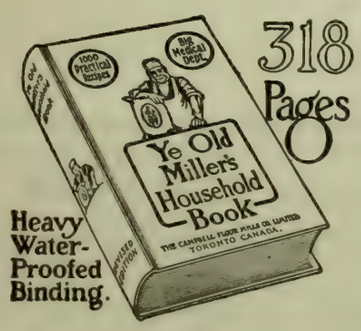
If you want fine big, bulging loaves, with delicious flavor, even crumb and all the wholesome nutritious quality of Western hard wheat, you decidedly ought to try Cream of the West flour for your next batch. If your bread proves unsatisfactory, return the unused flour to your dealer; also bring this advertisement which is our guarantee. He will return your money and we will repay him.

Our Domestic Science Experts solve your problems

Do you know what makes bread go sour sometimes? Are you puzzled about your pie crusts turning soggy for the first time, in spite of your close attention to the recipe? Would you like advice about the right kinds of pastry for different kinds of fillings? It is such unexpected, mystifying difficulties as these that we want to help you solve.

No matter what your problem may be, with either your bread or your pastry baking, our Domestic Science experts are cordially willing to help you solve it—whether you use our flour or not. Just write us a letter in your own way and explain clearly what you want to know. Give name of your dealer, and also state what flour you are using. Address—Domestic Science Department, Campbell Flour Mills Co., Limited, Toronto, Canada.

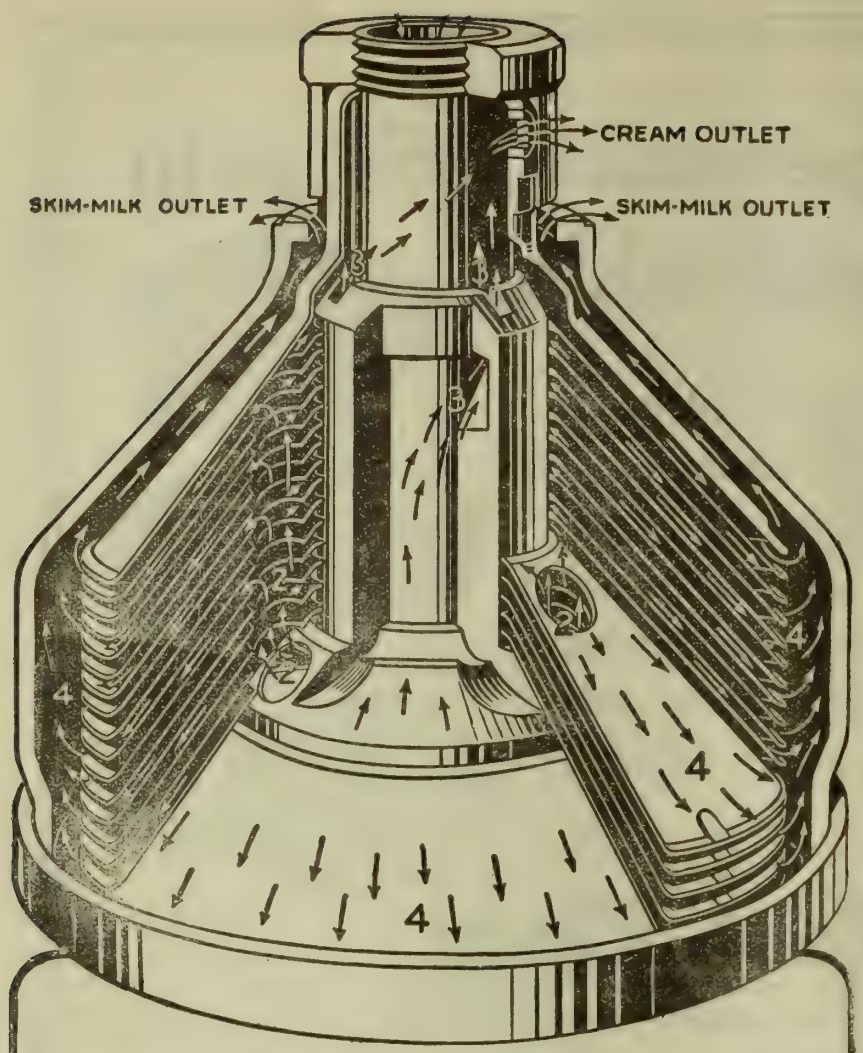
You can get these famous books Free



Ye Old Miller's Household Book may be had for a certain number of cards. This splendid book contains 1000 recipes; large medical section—telling how to deal with accidents, sickness, etc. Every home should have this book.

Users of Cream of the West flour have the splendid privilege of selecting books free, from the Campbell Library. In every barrel, half-barrel or sack you will find a colored library card. Collect and send these cards to us in exchange for books, which become your own property. Here are some of the titles of the books you may select:—"David Copperfield," by Dickens; "Last Days of Pompeii," by Lord Lytton; "The Three Musketeers," by Dumas; "Vanity Fair," by Thackeray; "Waverley," by Sir Walter Scoott, and standard favorites by Fenimore Cooper, Hawthrne, Reade, Charlotte Bronte and others. Also books for boys and girls. Full list on cards.

The Campbell Flour Mills Company, Limited, Toronto, Canada



Here is the heart of

THE NEW DE LAVAL CREAM SEPARATOR

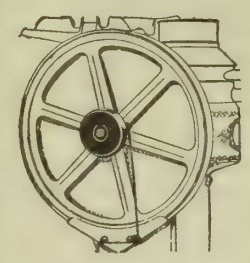
THIS is the new self-centering De Laval bowl with detached spindle, that is creating such a sensation in the dairy world.

This new De Laval bowl, with patented tangential tubular milk passages and patented removable milk conveyor, makes possible in a bowl of given size and weight, operated at a given speed, greater skimming efficiency and capacity than has ever before been attained in any other cream separator bowl.

These are big advantages that you can secure only in the De Laval.

But aside from the big advantages of greater capacity and closer skimming, there are many other important improvements in the New De Laval.

All discs are now interchangeable and are unnumbered. There are fewer discs. On account of greater simplicity of bowl construction, the New De Laval is easier to wash and, capacity considered, is still easier to run than before. High grade construction and design, together with perfect automatic lubrication, are a guarantee that the splendid De Laval record for durability will be maintained in the new style machine.



Every New De Laval is now equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed and uniform cream.

If you are trying to get along without a cream separator or with a half-worn-out or unreliable machine, why not get a NEW De Laval NOW and stop your cream waste? You don't need to count the cost, because the De Laval will soon pay for itself.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you try it for yourself.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

New Catalog will be mailed upon request

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

DAIRY SCHOOL

For Maritime Provinces

Conducted under the joint support of the Departments of Agriculture of New Brunswick, Prince Edward Island and Nova Scotia, at the

Nova Scotia Agricultural College

TRURO, NOVA SCOTIA

From March 7th to April 3rd, 1917

BUTTERMAKERS' COURSE
March 7th to March 20th
Mr. Mack Robertson, Chief Instructor.

New Machinery Installed, Pasteurizing Vats, DeLaval and Success Churns, Butter Cutting and Printing Machines, Starter Cans, all the latest in creamery butter manufacture, Incorporation of Moisture, Cream Grading, etc.

CHEESE MAKERS' COURSE
March 21st to April 3rd
Mr. Geo. H. Barr, Chief Instructor

The latest and best ideas in cheese making, Agitating Vats, New Presses and other New Machinery. The use of Pepsin as a coagulator, etc.

TESTING OF MILK AND ITS PRODUCTS
C. W. McDougall, Chief Instructor

The Babcock Test in all its branches, The Acidimeter, the Moisture Test, the Sediment Test and the Lactometer.

CREAM SEPARATORS
Ben Gallant, of P. E. I., Chief Instructor

11 makes of machines to work with. General operation, Causes of Variation in Cream Tests, etc.

Free to all in Maritime Canada who have had at least one season's experience in a cheese factory or creamery, or make special arrangements with the Superintendent in charge.

Special Arrangements
Railway Fare on Standard Certificate Plan. Special Arrangements made by each Department of Agriculture.
For particulars write your Provincial Dairy Superintendent.

OTHER SUBJECTS

This Course is being held at the College of Agriculture due to the fact that in addition to equipment for above subjects, the College has probably the best herd of Dairy Cows in the Maritime Provinces, good Poultry yards, a Chemical Laboratory properly equipped, Bacteriological Laboratory, Library and Reading Rooms, and a large staff of Professors and Instructors who will be at the service of the students of this course. Lectures and demonstrations in the above subjects will be given as circumstances permit and consultation as arranged.

The most competent instructors that can be secured in Canada.

Two courses of two full weeks each filled with what is practical and needful to our creamery and cheese factory men.

Can you afford to miss it?

For further particulars write

W. A. MacKAY, Superintendent in Charge, Truro, N. S.

STRAWBERRY PLANTS !

Growers of Strawberries in the Maritime Provinces receive fifty per cent. more for their fruit than farmers in Ontario. Our soil is just as suitable, our climate just as favorable for big crops as theirs. No one should talk hard times who is not living up to his opportunities.

In berry growing good soil, good care and cultivation and good plants are all the essentials of success; but as the stream cannot rise higher than its source, so without first-class well grown plants good returns for labor cannot be expected. We can prove by many satisfied customers that the grower who buys plants from us is starting on the right road for a big berry crop.

We offer the Senator Dunlap, the most widely grown and popular berry in America at $3.50 a thousand. In orders of five thousand or over, $3.25 a thousand. We have also Arnout, Williams, Valeria, etc., the old standbys and the best new kinds.

Send for descriptive Catalogue and Price List, it's FREE.

Volume 22. SUSSEX, NEW BRUNSWICK, FEBRUARY 20, 1917. Number 10.

N. B. Farmers' and Dairymen's Annual Convention

The forty-first annual convention of the Farmers and Dairymen of New Brunswick was held in the city of Fredericton on January 29th to February 2nd. The opening session was at eight o'clock Monday evening, when Mr. Geo. E. Fisher, the president of the Association, occupied the chair and delivered the following address:—

The President's Address

In reviewing the work of the past year, or since last we met in annual session, the question arises, "What have we, as an association, accomplished or done for the general advancement of agriculture in this, our own province? What does the constitution demand of us?" And, as we are tonight celebrating the 41st annual session of the Farmers' and Dairymen's Association of New Brunswick, well might we ask the question: "Are we making progress or only marking time; are we in New Brunswick keeping pace with our sister provinces in agricultural development, and are we keeping abreast of the times like other professions." But let us leave the question unanswered for a little. What did we do?

The only evidence that we have existed at all in the past, as an association, is the fact that we have met in annual session year after year; and there it ends, and periodically pops up serenely a year hence. But perhaps 1916 was an exception.

We held a mid-summer meeting and enjoyed a most delightful and profitable day at the Experimental Farm—a day that will long be remembered by many. If you can, imagine 1,200 to 1,500 interested people, scattered over the well laid out fields and plots of this beautifully situated farm—part of which only a few short years ago, was a virgin forest—all these people eager to gather information and see how things are conducted in general on a large and well equipped Experimental Farm.

Superintendent Hubbard surely is to be congratulated upon the progress he has made; and the pleasure and enjoyment of the day spent there was largely due to his efforts. New Brunswick is fortunate in having such a splendidly equipped agricultural centre from which we hope there will, in the near future, radiate such a gleam of agricultural activity as will make up for the valuable time lost in the past.

This, then, comprises the field of our activities as an association for the year 1916. To my mind 1916 will go down in history as a banner year for New Brunswick farmers. Crops were good, generally speaking, and markets for every kind of produce were the highest yet recorded, with the demand greater than the supply. Why? "Ah, there's the rub," as Shakespeare says.

We didn't have sufficient wheat to make the $11 barrel flour that we are buying today, nor enough pork to make the 25 cents a pound bacon our Prince Edward Island and Ontario neighbors are selling today, nor did we keep enough cows to produce the butter and cheese that are commanding the highest prices ever heard in our history. Think of it!—40 cents for butter and 25 cents for cheese. What do you say it is—a "lost opportunity."

The Farmers' Opportunity.

Opportunity Ah, this is the farmers' opportunity, and we should spell it in large capital letters and, linking it up with co-operation, we, as farmers of New Brunswick, would be taking a step in the direction of advancement.

Advancement that will lead us still further on to the realization of what progressive agriculture means, not only to ourselves and for ourselves, but as a noble heritage to hand down to those who come after us, as well as for the general good of the country in which we live and should be justly proud of Yes, "Home Sweet Home"—be it ever so humble there is no place like home in New Brunswick. And no doubt the lads who have gone out from our good old province and are doing their "bit" for the dear old flag and home would fight with a greater determination than ever if they felt that those who had to remain behind were also doing their "bit" by living up to their opportunities and the greater demands required of them at this critical period in the history of Great Britain by now making a supreme effort along the lines of increased production.

Our slogan should then be "increased production." And should we not, as an association and true, loyal British subjects, pledge ourselves at this annual meeting, to everything that is in sympathy with the present day demands upon us?

Winston Churchill said that he was quite sure that national organization of agriculture was inevitable, and we need a great organization for producing munitions of life—just as we do for munitions of death.

In leaving these few thoughts with you I would, in conclusion, like to pay a slight tribute of respect to the memory of the late Dr. C. C. James, who a year ago stood on this platform and in eloquent and appropriate terms, emphasized the great question of increased production. Tomorrow, when we enter into the discussion of the subjects on the programme, we might well take the advice of that eloquent champion of agriculture (quoting from an address delivered in Toronto shortly before his death), when he summed up his remarks in these words:

1—Drain the soil.

2—Sow only the best seed.

3—Carefully protect and store the products of the fields and orchards.

4—Feed field products only to profitable stock.

5—Put the finished product on the market in the best form.

Gentlemen, I trust our deliberations during the week will be both provtable and pleasant.

The Address of Welcome.

In extending the welcome of the city of Fredericton, Mayor Mitchell referred to the efforts for increased production to the efforts for increased production which the farmers had already made since the outbreak of the war and the necessity for continuing, and if possible, of increasing those efforts. He took occasion to congratulate the Provincial Government on the forward step that they had taken in aid of agriculture, in the recent engagement of Prof. J. W. Mitchell as superintendent of livestock and dairying.

The reply to the Mayor's address of welcome was briefly and acceptably made by H. H. Smith of Hoyt Station, in place of Mr. A. J. Gaudet of Dorchester who was unavoidably absent.

Following the addresses of welcome and reply thereto, Hon. James A. Muray, Minister for Agriculture addressed the convention.

At the outset he touched upon the war and referred to his recent visit to London where he had seen. as it were, the very heart throbs of the nation, and become impressed with the unbreakable spirit of grim determination that dominated the Empire and permeated throughout the overseas Dominions and their provinces of which New Brunswick had a proud record of valor and self-sacrifice—a spirit that meant to see the war which was really a struggle for freedom, righteousness and for life itself through to a victorious termination.

Previous speakers had referred to the great prosperity of New Brunswick and he believed that this was an evidence that the province was just coming into its own. As a result of the publicity which the Government had given to the province lately, its resources and advantages were becoming more widely known and the offices at St. John and Fredericton had received scores of enquiries from Western Canada and the New England States. He thought that we should show our faith in the province by still greater publicity of its many attractions.

Continuing, Mr. Murray said that while emigration from Europe might not come immediately after peace he was firmly convinced that a great tide of immigration was coming sometime soon as a result of the war. New Brunswick would bet its share of the immigrants and in 10, 15 or 20 years time there would result a greater increase of our population than we had ever dreamed of 20 years ago. He based this assertion on the enquiries received from soldiers at the London office and by the C. P. R. officials.

He was glad to say that they had made considerable progress in agriculture in the province. The Department of Agriculture favored the purpose of aiding farmers and farming and was at the disposal of the Farmers' and Dairymen's Association. He invited their assistance, cooperation and constructive criticism in working out the best policy for the province. He referred to the recent engagement of Prof. J. W. Mitchell as superintendent of the live stock and dairying division as a step which he felt sure would result in the building up of those important branches of agriculture. He was satisfied that dairying and mixed farming were the basis of successful farming in New Brunswick.

Mr. Murray referred very briefly to the many other forward steps which his department had initiated, including the demonstrations given by the clover huller, lime rock crusher and ditching machine, the campaign for the use of home mixed fertilizers, the work of the Women's Institutes, the building of the agricultural schools and the vocational and elementary agricultural education work.

In conclusion he hoped that their sessions and deliberations would prove very successful and prosperous.

County Reports

The reports of the vice-presidents for the several counties for the past year were then called for. They dealt in a specific manner with the results of the crops during the past season, the condition of live stock, etc.

Reports from the following counties were submitted as follows: Queens, Isaac Baird; Albert, Mr. Paisley; Carleton, L. V. McIntosh; Charlotte, Stanley Wilson; Kings, Leslie Wood; Madawaska, J. E. Bernier; St. John, A. Johnston; Sunbury, H. L. Dibblee; Westmorland Frank Fawcett, and York, W. H. Moore.

In the reports from Albert and York counties it was stated that the dog nuisance was a considerable detriment to the sheep raising industry. All the reports emphasized the difficulties that the farmer has to face owing to the scarcity of labor due to the war.

In the report for Carleton County, Dr. McIntosh said that the potato crop was about sixty per cent but that thousands of barrels of potatoes are yet being held in storage on the farms. One flock of sheep imported into that county last year cost $500 but the industry is growing. Condi-

tions throughout the province in general were shown by reports to have been good with the hay crop particularly fine and good prices prevailing.

In his report for the County of St. John, Mr. Johnston made reference to the loss sustained by the association in the death of R. G. Murray, while he also showed that market dairying is a profitable industry and with respect to milk said that the profit has reached the vanishing point.

Frank Fawcett in his report, made the interesting statement that 100 tons of strawberries had been sent out during the year from Sackville, and that one farmer cultivated twenty-five acres of berries.

Committees

Finance—Scott Shaw, I. W. Baird and Jas. Bremner.

Resolutions—M. A. MacLeod, W. E. Palmer, W. W. Hubbard, Sidney Dis-Brisey and Frank C. Fawcett.

Tuesday Morning

The Tuesday morning session was devoted to a discussion of the Sheep Industry and the reasons why it is not advancing more rapidly in the province. Geo. E. O'Brien of the Live Stock Branch, Ottawa, was the first speaker. He did not dwell at any length on the advantages of the industry as they are already well known. There are, however, several bars to more rapid progress in this important industry. Chief of these he said, are the fence problem and the dog nuisance. The former drawback is within the grasp of the sheep owner, but the latter nuisance is beyond his control until better laws are enacted for his protection. His address throughout was a forceful exposition of the situation and along similar lines to the arguments advanced by him in our report of The Nova Scotia Farmers Association.

M. A. MacLeod and C. N. Shaw led the discussion on the dog nuisance, the outcome of which was the appointing of a committee to draft a resolution to be submitted to the New Brunswick Legislature asking for protection to the sheep industry from the dog nuisance. M. A. MacLeod, C. N. Shaw and Prof. Mitchell were appointed to draft the resolution in question and submit it at a later session.

Mr. Jas. Thompson of the Live Stock Division, Ottawa, gave a short talk on wool grading and the care of wool.

Pork Production

Breeding and Feeding for Pork Production was the subject of an excellent address on Tuesday afternoon by W. W. Baird, Supt. of The Experimental Farm, Nappan, N. S. The discussion that followed showed the interest the New Brunswick farmers take in the pork producing industry. Mr. Baird was kept busy answering questions. A most profitable and instructive talk was the unanimous verdict of the delegates.

We will publish extracts from Mr. Baird's address in a future issue.

The Tuesday evening session was replete with good things for the Potato growers. Prof. Cunningham, Provincial Plant Pathologist, read an excellent paper on "Potato Diseases and their Control and Selection of Prolific Strains." "Late Blight and its Control by Spraying", was dealt with by Geo. Partridge, Prof. Cunningham's assistant. We will publish both of these papers in future issues and take this opportunity of asking our readers to study the thoughts therein expressed and follow by practice the recommendations of these gentlemen. They know whereof they speak and it will mean dollars and cents to the Farmers who will follow their recommendations.

A practical talk on the preparation, cultivation and fertilization of the Potato Field by Mr. W. W. Hubbard, concluded the evenings program.

Fertilizers

Wednesday morning's session was devoted to a talk on Fertilizers by Mr. H. B. Durost, Instructor in fertilizers for the province. Mr. Durost discussed the constituents of soils, the food requirements of plants and the ingredients commonly used to supplement the plant food already in the soil. We believe Mr. Durost's address was the best information on the plant food question ever delivered to a New Brunswick audience. In concluding his address Mr. Durost referred to the good work that is being done by The New Brunswick Agricultural Societies United in the purchase of fertilizers and distribution to the members of Agricultural Societies at the lowest possible cost. It was after the noon hour before Mr. Durost concluded his address, yet every one was anxious to remain and glean as much information as possible.

Wednesday Afternoon

On Wednesday afternoon Mr. O. C. Hicks of the Provincial Dept. of Agriculture read an excellent paper on Clover and Timothy Seed Production, which was both interesting and timely, and particularly so at the present time when farmers, owing to the high prices prevailing for good seed, are thinking seriously of producing their own supply. That this can be done, was clearly shown by the excellent quality of the exhibits at the seed fair held concurrently with the convention. Mr. Hicks' paper will be published in the Maritime Farmer in good time for the following next season of the ideas set forth by Mr. Hicks.

S. J. Moore of the Seed Division, Ottawa, followed Mr. Hicks with a talk on Lessons to be Learned from Seed Fairs and Field Crops Competitions. Mr. Moore is no stranger to New Brunswick audiences. He has been doing good work as seed inspector for the Maritime Provinces for over a decade. Mr. Moore had a long and successful career as a farmer and when he talks to farmer audiences, they know that he is speaking from practical experience and have every confidence in his recommendations. Some time ago he approached the New Brunswick Department of Agriculture with the suggestion that it would be a boon to the farmers of the province if the Department would purchase a clover huller for the use of farmers who wish to grow clover seed. The suggestion was acted upon and the result is that hundreds of bushels of clover seed have been threshed and bulled by New Brunswick farmers during the past season. Having a machine for the proper handling of the seed has been a big incentive for the farmers to produce. Mr. Moore thinks that in a few years New Brunswick will be able to produce its own clover seed supply.

Field Crops Competitions

"With regard to lessons to be learned from seed fairs and standing field crop competitions, Mr. Moore said:

"When I became associated with the Dominion Seed Branch eleven years ago, there was not very much being done in this line, but a lot has been done during the last few years and numerous seed fairs are annually held in the Maritime Provinces, also last season, 300 farmers took part in the field crop competitions. I should like to see three times 300 taking part, for then we should be in a position to supply all our wants with regard to seed without having to depend on other sources. Without saying anything disparaging of the other counties of this province, you have in Carleton County one of the finest farming sections to be found anywhere, the possibilities there are great and advantage should be taken of them.

The big lesson learned from Seed Fairs and Crops Competitions is that we can grow just as good seed and crops in New Brunswick as in any part of Canada.

Mr. G. LeLacheur, of the Dominion Seed Branch, Ottawa, who was one of the judges of grain at the seed fair, gave as his opinion that the exhibit of grains was one of the best he had seen in the Maritime Provinces. He also explained the working of the Dominion Seed Control Act.

G. W. Ganong, ex-M. P.

Mr. G. W. Ganong, ex-M P., of St. Stephen, gave a short address. He congratulated the farmers on having such a splendid organization as the Farmers' and Dairymen's Association. He declared that he was an enthusiastic horticulturist, not for profit but for pleasure, and he urged the farmers not to put all the profits from their farms away out of sight in the banks, but return at least some of it to their farms, to cultivate a love for the beautiful, to plant flowers and shrubs around their homes and thus give a brighter outlook on life to their families.

The Wednesday Evening Session

was a patriotic conference. His Honor Lieutenant Governor Wood presided.

His Lordship Bishop Richardson delivered a strong practical address. He saw in the Farmers' and Dairymen's Association a forerunner of big things for the future. He trusted that the farmers of New Brunswick would ere long band together and exercise a far greater share in the political life of the province. The representation of farmers in the Legislatures of Eastern Canada is very small. Farmers should stand together and vote together. The spirit of cooperation should be more in evidence and there was no reason why the farmers of the province should not organize and cooperate in buying and selling their requirements and products. This system would put more money in the pockets of the producers and take less out of the coffers of the consumers.

The Bishop said that while matters were going on well in the province, the present is no time for optimism. What of the end? The war must not end too soon or Germany will have won ninety per cent of what she was fighting for. He also said that while the producers are doing good work, we must all take off our hats to the man or boy who shoulders the musket. He is the most patriotic man in our midst.

To be patriotic as producers it is necessary to attend to certain facts:—

1. Produce all you can by intensive cultivation and attending to every detail that the best authorities in the land recommend.

2. Make all the money you can, but make it honestly.

3. Spend as little as you can on matters that you are better without or that you can very well do without. Let your spending be along the line of improvements to your farm. Do not practice unproductive expenditure.

4. Save all the money you can. We are passing through a period of fictitious expenditure. Put your surplus funds in war loan certificates and bonds.

J. H. Grisdale, Director of experimental farms was to address this meeting, but owing to illness in his family, he was unable to attend and Prof. Cumming came over from Truro to take his place on the programme. Prof. Cumming said every physically fit man must face the issue of donning the khaki.

Those who stay at home have also an important duty to perform in the production of food, for food is an important factor in winning the war. Canada occupies an important place in the Empire's food supply. Our country is exerting supreme efforts and money must be secured to meet the obligations assumed.

The growing of plants is the only one means of exploiting nature without exhausting her resources. He went on to say that only five percent of the constituents of a plant came from the soil, the balance is supplied by water and air. The farmer has therefore only to attend to from five to eight percent of the work of supplying plant food, the God of Nature supplies all the rest. The work of growing crops is therefore that of cooperation between God and man.

The man power on our farms is now at a very low ebb and consequently the work of production is hindered. He then set forth the following ideas as how the farmers can increase production under the present circumstances:—

Make all plans for spring work early. Have the implements prepared so that no time will be lost when the season opens. Have the seeds and fertilizers ready. Use improved seeds —instead of ordinary seed—an increase of 10, 15, 20, 25 or more per cent can certainly be made in this way. If you use home grown seed use the fanning mill and sow only the best. Sow more clover seed. Use larger farm implements so that one man may practically do the work of two or more men when only small machines are used. Take better care of the farm yard manure. Improve the quality of stock by better feeding and breeding. Grow more of the feed required for stock. Increase the value of pasture lands by topdressing with basic slag and wood ashes. It is not enough that a farmer grow just enough for his own use in order to be patriotic. He must have a surplus to help feed the classes that are not producers of food, but who are nevertheless engaged in other useful work.

Hon. J. B. M. Baxter, Attorney General for the province, in the course of his address referred to the thousands that must come to the province when the war is over. The majority of these will be engrossed by the possibilities of agriculture. New Brunswick's patriotism is well represented at home and abroad. He feelingly referred to the vigils our boys are keeping in the trenches. In this earth there is nothing great but man—in man there is nothing great but mind. England has long since proved the principle that individual freedom is greater than collective freedom. It was the individuality of the farmers of England centuries ago that gave us the basis of the New Brunswick statutes of today. Having proved the merits of individual freedom, England is now on the verge of getting this boon for the smaller states of Europe. There are many ways by which we can do our bit, and we will do it freely not by compulsion. The renowned John Hambden would not give six cents for an oppression campaign, but he would contribute £'s for freedoms cause.

G. B. Ganong of Stephen was the last speaker of the evening.

Thursday Morning

How to Make Poultry Pay from a Farmers Standpoint was the subject of excellent talks by J. B. Daggett and Seth Jones of The New Brunswick department of agriculture at the Thursday morning session. They dealt with the subject very fully and answered a host of questions, which showed an increase interest in the industry. Both speakers pointed out the demand that exists for quality products and the vast possibilities of the well kept and cared for farmers flock.

J. B. Gaudet and Mr. DeGrass addressed the meeting so that the delegates from the French districts of the province could hear agricultural matters discussed in their native ton-

gue. They exhorted their compatriots to glean as much information as possible from the various addresses delivered at the convention. They asked them to take an active interest in the work of the association and carry messages of progress back to their respective districts.

Thursday Afternoon

H. N. Flewelling was the first speaker at the Thursday afternoon session. Mr. Flewelling has charge of Cow Testing Record Centre work in South Western New Brunswick. His records of the respective herds in his district make interesting reading and is proving a means of sounding the death knell of the boarder cows.

Increased Production in Three Years

	No. Herds	No. Cows	Av. Lbs. Milk	Av. Dbs. Butter Fat
1913	23	274	4000	190.0
1915	23	2f9	5312	222.1
Average increase			712	32.1

Mr. Flewelling showed the following charts of the work done in the herd, over which he has the oversight during the absence of their owner, who is in khaki:

	$2920.88

Loss, $169.87

The various items on the charts were discussed and the audience expressed itself very freely on the points under discussion.

Expense sheets are not frequently considered by our dairymen. Mr. Flewelling's charts were somewhat of an innovation to the majority of the farmers at the meeting. The subject of profitable dairying was therefore brought to their notice by the speaker in a most appealing manner—the comparison of receipts and expenditures—Dollars and cents count.

Prof. Mitchell was the next speaker—his first address in his official capacity before the N. B. F. & D. A. He was well received. He asked for the cooperation of the farmers in advancing the livestock and dairy interests of the province. The cooperation of the farmers with the Dept. of Agriculture had been the means of his success in making the advances that had been made in Manitoba. He said the possibilities for live stock in New Brunswick may best be judged by the advantages the province affords, rather than by present actualities.

The province is capable of maintaining a population of over 4,000,000, at present we number in the vicinity of 370,000. We only have about 65,000 horses, whereas we could easily keep 450,000. Cattle 1 800,000 instead of the present 247,000, and sheep and swine 3,750,000 instead of our 225,000.

New Brunswick soils will produce in proportion to the state of their fertility and the care exercised in cultivating them. The basic principle underlying successful stock raising is the production of ample supplies of home grown feeds. The use of pure bred sires of high quality , the following of record keeping and community breeding are other factors that must claim the attention of all who would succeed as stockmen. In regard to the bonusing of pure bred stock purchased by agricultural societies, Mr. Mitchell said he would favor the introduction of a sliding scale whereby societies purchasing stock from high record sires and dams would receive special encouragement. He believed such a system would have a strong uplifting influence on the societies, and also on the breeders, as many of them would have to pay more attention to production in order to be able to sell their stock.

There is no reason why so much pork products should be annually imported to the province.

Prof. Mitchell then discussed the nutritive value of feeds and balanced rations. He put forth a plea for the better care of live stock. In regard to dairying, next to feeding, he said the keeping of individual records was the most important, then came the concentration of the manufacture of dairy products. He advocated cream gathering creameries as the proper type for the province, also the establishing of cream grading and the production of quality products which never lack a good market.

Mr. C. W. McDougall also pointed out the value of record keeping, not only of receipts but also of costs, the comparison of which must certainly provide food for thought for the individuals who take an interest in their work.

The Business Session

The business session was held Thursday evening. The resolution committee brought in the following resolutions, all of which were passed:—

A resolution asking the Dominion Government not to allow the introduction into Canada of the manufacture and sale of oleomargarine.

A resolution recommending that in view of services well and faithfully rendered on many occasions to the Association by Mr. Hubbard, that he be made an honorary member of the Executive of the Association.

A resolution asking for more adequate protection to sheep owners from the ravages of dogs. The substance of the resolution will be found on the editorial page of this issue.

A resolution asking the Department of Agriculture to establish egg circles in the province.

M. A. McLeod referred to the question of an abattoir for St. John, and suggested that a committee be appointed to consider the whole question and report at the next meeting.

Mr. Daggett announced that the Minister of Agriculture was at the present time considering this question and favored the appointment of such committee in order to strengthen the hands of the minister. The chairman appointed as the committee M. A. McLeod, Prof. Mitchell and H. H. Smith.

Following on the suggestion of Prof. Mitchell it was recommended to the department that the bonus paid for pure bred sires be on a sliding scale in accordance with the merits of said sire.

Officers for 1917

The report of the nominating committee was accepted as follows:—

Isaac Baird, Chipman, president; R. R. Patchell, St. John, vice-president; C. M. Shaw, Hartland, recording secretary; A. R. Wetmore, Clifton, corresponding secretary; H. H. Smith, Hoyt Station, treasurer.

County vice-presidents—Albert, C. E. Newcombe Hopewell Hill; Carleton, Scott A. Shaw, Hartland; Char-

OPEN LETTER TO SHEEP OWNERS AND FAIR MINDED DOG OWNERS

The advantages of the sheep industry are so well known that, with our friend, Geo. E. O'Brien, who has charge of the work of encouraging the work in the Maritime Provinces, we would say they need not be recounted. Suffice to say that never in the history of the Maritime Provinces did such high prices for wool, lamb, mutton and breeding stock prevail as during the seasons of 1916. And those who are in position to forecast the world's markets, tell us that never again will the prices for these commodities sink to figures that will not leave a handsome dividend on labor and investment.

In spite of these facts our flocks are not increasing in numbers nor are the individual flocks increasing in size. In fact, we are told that there is a decrease in the number of flocks and such is also our own observation. The "why" of the decline was clearly set forth by the various speakers at the Nova Scotia and New Brunswick Farmers' Associations recently held respectively at Amherst and Fredericton.

The Fence problem and The Dog Nuisance were the two principal causes to which the decline was attributed.

The Fence Problem is one that is within the grasp and under the control of any person who wishes to embark in the industry or increase the size of his flock.

The Dog Nuisance is not so easily controlled. Thousands upon thousands in cold, hard cash have been lost by the sheep breeders of the Maritime Provinces through the ravages of dogs.

When a thief enters the premises of some business concern and carries away surreptitiously some of the belongings of the concern, and when the burglar breaks and enters some home, a hue and cry is raised and the officials whose duty it is to maintain law and order trail the offenders and bring them to judgment, even if the value of the stolen goods is trivial. Bears and wildcats do considerable damage in some localities and the law provides for the payment of a bonus for each and every bear or wild cat to the person supplying sufficient proof that he has reduced the number of these predatory animals.

Contrast the attitude in regard to sheep killing dogs. A farmer may lose from one to fifty or more sheep by the ravages of dogs—the damage may total a hundred times the damage done by the burglar or thief and the farmer is left to fight his own battles. If he can discover whose dog did the damage he may proceed to regain the value of the damage done, providing the owner is worth the amount. If the dog's owner is not worth the amount of damage done, the sheep owner has his trouble for his pay and is obliged to pay the costs and for ever after live in the bad graces of his neighbor.

There is not a county in the three Maritime Provinces but is interested in sheep. There is not a county in the three Maritime Provinces but could raise more sheep. There is not a county in the three Maritime Provinces that would not profit by keeping more sheep within its borders. There is not a county in the three Maritime Provinces where considerable damage is not done every year to sheep flocks by dogs. There is not a county in the Maritime Provinces in which there is not annually considerable damage done by dogs whose owners is not known, as the damage is usually done during the night. There is not a district in the Maritime Provinces through which dogs will not roam the whole length and breadth of the Municipality to destroy sheep and be back in their owners front yard next morning, looking as meek and innocent as you please. There is not a municipality in the three Maritime Provinces where every dog owner, nay 50% of the dog owners, can with a clear conscience and before their maker say "I can swear that my dog will not worry sheep if given a chance."

What is the use of the Federal and Local Departments of Agriculture to spend time and money in efforts to stimulate the sheep industry, when the sheep owner has no protection for his taxed sheep from untaxed dogs. The whole matter is simply ridiculous. Why are our law makers so chary of the dog owners? We are ready to admit with one of the dog advocates at the recent meeting of The New Brunswick Farmers' and Dairymen's Association, that there are some so called "respectable" dogs, but there are many, many more "unrespectable" dogs, and in this case the just must suffer for the misdeeds of the unjust. A respectable man will not consider it any hardship to par a tax on a respectable dog. The owners of the unrespectable dogs, when obliged to pay a tax on the useless curs, same as the sheep owner has to pay on the useful, profit producing sheep, will see them first safely across to the happy hunting grounds, the only safe place for such depridators.

There is not a dog owner in the Maritice Provinces who, when a dog tax comes in force, but will destroy his dog sooner than pay the tax, if the dog is not of much account—and their class is legion.

There is a dog law on the statutes of Nova Scotia and New Brunswick, but it is not in force.

Read the resolutions passed at the recent meetings of the Farmer's Association of the two provinces. The New Brunswick Farmers resolution:—

Resolved that the Legislature of the Province of New Brunswick he respectfully requested to amend, where necessary, the Act respecting the protection of sheep from dogs so as,

1. To make the tax on all dogs in a municipality compulsory—$1.00 for dogs, $5.00 for bitches and $1.00 for spayed bitches.

2. To give protection as per the act of 1909, Chap. xxvii, which reads as follows: "Any person may kill, (a) any dog which he sees pursuing, worrying or wounding any sheep or lamb; or (b) any dog giving tongue and terrifying any sheep or lamb on any farm; or (c) any dog which any person finds straying, on his or her premises at any time; provided always, that no dog so straying, either when securely mussled or accompanied by any person owing or possessing or having the charge or care of said dog, shall be so killed, unless there is reasonable apprehension that such dog if not killed is likely to pursue, worry, wound or terrify sheep or lambs then on said farm."

3. To make compensation in full, for damages sustained, compulsory, such to be payable by the municipality and to be recoverable by the municipality from the owner or owners of the dog or dogs causing the damage.

Competent assessors be appointed by the municipality to fix damages.

The Nova Scotia Farmers Resolution:—

Whereas, the worrying and killing of sheep by dogs has caused a great decrease in the number of sheep maintained in the Provinces of Nova Scotia, and

Whereas, other provinces of this Dominion have enacted laws which provide for the protection of sheep from depredation by dogs,

Therefore resolved, that we, the farmers of Nova Scotia, assembled in convention at Amherst, appoint a committee whose duty it shall be to go before the Legislature of this Province at its incoming session, and present the views of this convention asking the Legislature to enact such regulation in this matter as we deem advisable.

The farmers recommended a tax of $1.00 on dogs and spayed bitches and $5.00 on bitches.

2. The privilege to kill roaming dogs as now permitted by the present Act.

3. Compensation for damage done out of the funds of the municipality.

There are no radical changes nor no unreasonable demands in either of the foregoing resolutions. The law is now on the statutes of the respective provinces, but is not enforced. The sheep owners and the best thinking public minded dog owners ask that it be enforced—compulsory, not left to be a bone of contention between neighbor and neighbor.

A few dog owners are opposed to the making of the law compulsory. Review these men—weigh them in the balance. Are they the class of men that stand for everything that is progressive in your community or are they the kind that are content to work along in any old rut and habitually hinder progress? A Fredericton about ten farmers signed a petition asking that dogs be not taxed, and placed it in the question box, but only one of their number had the courage of their convictions to speak when the question was being discussed.

If you are in favor of having more adequate protection for the sheep industry in your prov-

ince, write a letter to your county representatives in your local legislature, asking them to give their support to such a scheme of protection. Also send the MARITIME FARMER a postal card saying "I have written Mr. ———, our county representative to support the sheep protection scheme." Get your neighbors to do likewise. Do it now. The Maritime Farmer will file all cards received and will place them in the hands of the Legislative Committees of the respective provinces to strengthen their hands in their work before their Legislature.

Annual Convention Nova Scotia Farmers' Ass'n.

(Continued from last issue)

Owing to lack of space we were obliged to carry over a portion of the report of the Annual Meeting of the Nova Scotia Farmers Association. We discontinued our report at the conclusion of the reading of the exhibition commissioners report. The report in question was discussed and adopted, the meeting being well satisfied that the commissioners had done the work entrusted to them satisfactorily.

Women's Institutes What They Are and What They Have Done

Women's Institutes What they Are and What They Have Done was the subject of an interesting talk by Miss Jennie A. Fraser, the efficient and popular superintendent of Women's Institutes for the province. Miss Fraser congratulated the Association on having attained its majority, and said this was her fourth appearance before the Nova Scotia Farmers Parliament. There are forty nine womens institutes in the province, with a membership of nearly 1600 and their work has extended to the trenches, where our brave soldiers are fighting for us. At the close of the war many sections of the province will be ripe for the organization of Institutes to take the place of Red Cross and kindred societies. Miss Fraser then enumerated the contributions and donations made by the Women's Institutes of Nova Scotia for patriotic and relief purpose, all of which speak in accents louder than words of the self sacrifice of the women who compose the various institutes.

But the institute work did not consist of patriotic and relief work alone, they have also been busy along social and community work in their respective sections Nearly every institute takes a keen interest in the work of its local school. These schools have profited to a considerable extent. Water-coolers, individual drinking cups, new maps, girls sewing classes, school exhibitions, painted school houses and even the election of one or more women members to the school boards are just a few of the advantages for which some schools are indebted to their local Institutes.

Some of the institutes have entertained the soldiers quartered in their vicinity. Some are doing charity work. Others are improving conditions in their neighborhood as testify by better kept cemetery, church and school grounds and better sidewalks. In one locality a light was placed in front of the church and Miss Fraser humorously remarked it was not appreciated by the shyer young men of the congregation.

Miss Fraser then referred to the exhibition of arts and crafts at Halifax last fall and the demonstrations in weaving, etc. We have given a full report of the above mentioned exhibit in our report of the Halifax Exhibiton and consequently it will not be necessary to refer to it in detail, suffice to say that the demonstration was the best ever attempted at a Martitime fair.

The value of "a head in the home" to plan and make use of labor saving devices and the arrangement of kitchen, pantry, etc., were emphasized by Miss Fraser, who in concluding her address, said the work of the womens institutes is causing our women to take an increased interest in life and in the work of maintaining the empire.

THE ROAD PROBLEM IN NOVA SCOTIA

W. G. Yorston, Assistant road commissioner for Nova Scotia then addressed the meeting on "The Road Problem in Nova Scotia." We are planning to give our readers the gist of this address in a future issue.

Thursday Morning

The report of the credentials committee showed that there were 42 delegates from agricultural societies, 25 from county farmers associations and two delegates from the N. S. Fruit Growers Assn. attending the convention.

Mr. Robb of Amherst appeared before the meeting and explained the aims and objects of The Good Roads Association of Nova Scotia and was followed by Mr. C. D. Shipley, a representative of the Union of Municipalities.

Mr. F. L. Fuller remarked that if the Halifax exhibition is to become a purely agricultural show, it must be held at a later date, after the various county exhibitions are held and that it would be an educative plan to have the first prize winners from the smaller shows brought to Halifax. Messrs. Wm. O'Brien, A. S. McMillan, S. A. Logan, H. W. Corning, J. McFarlane and F. L. Fuller were appointed to look into the feasability of the plan outlined by Mr. Fuller.

The Election of Officers

President—Wm. Murray, Union Centre.

1st Vice-Pres.—Samuel Freeman, Amherst.

2nd Vice-Pres.—Ronald McDonald, Ohio.

Directors—Walter Churchill, Johnson Cameron, Robt. Newcomb, J. W. Allen, Wallace Rhodenizer.

Exhibition Commissioners—F. W. Foster and H. S. Kennedy.

Auditors—J. M. Trueman and J. P. Landry.

At a subsequent meeting of officers, C. R. B. Bryan was reelected Sec.-Treas.

The Closing Session

The closing session was held on Thursday afternoon. H. S. Kennedy led a discussion on the protection of the pure bred sire.

The following resolutions of last year's meeting were reaffirmed.

To the Legislative Council of Nova Scotia:

Whereas your honorable body have been enacting laws to improve the horse stock of the province of Nova Scotia, and

Whereas the Stallion Law as it at present stands is now effective enough owing the large number of grade and unsound stallions offering for service;

Therefore, we ask your honorable body to add a clause to the present stallion law doing away with all grade and unsound stallions before January 1, 1918.

We would also ask to have an inspector appointed at once for the purpose of enforcing the stallion law as it stands at present,

* * *

Whereas, the menace of allowing grade or scrub bulls to be used for service has been for many years acknowledged by the best farmers of Nova Scotia.

Therefore, be it resolved that we recommend that steps be taken to obtain such legislation as will remove this menace and to this end that a uniformly worded petition in blank be sent to each agricultural society in the province with the request that the members sign their names and return to the committee appointed for such purpose.—R. J. Messenger, Wm. Murray.

Adopted, and the following petition in blank authorized to be sent to each agricultural society in the province for the signature of the members:

Petition

We, the members of Agricultural Society respectfully request that legislation be enacted to prohibit the use for public service of grade or mongrel bulls within the limits of Agricultural Societies and Live Stock Associations, or wherever pure bred bulls are otherwise available, for public service, at reasonable fees, in the province of Nova Scotia.

In the case of the latter resolution it may be said that petitions were circulted and they were returned to Mr. Fuller, signed by about 1800 members of Agricultural Societies. Mr. Fuller said there would be no trouble to get the foregoing resolutions passed and enacted by our legislature, providing we want them to do so. The strongest lever for the passing of such acts would be personal letters from voters to their respective representatives.

Messrs. R. J. Messenger and Wm. O'Brien were appointed as Legislative Committee to lobby the farmers cause at Halifax.

The following resolutions were passed:

Whereas, it is felt that the present system of Municipal taxation discriminates unfairly against the man who has improved his property and correspondingly favors the man who has not effected improvements in his real estate, and

Whereas there is a lack of uniformity in the basis of assessments in the various counties of the Province and

Whereas it would be in the best interests of the Province if an equitable basis of assessment were established that would apply in all the counties of the Profince.

Therefore Resolved that the N. S. Farmers Association do petition the Government of Nova Scotia to appoint a commission to inquire into the system of municipal taxation prevailing in the Province with a view to fixing a more equitable basis of assessment in all the Counties of the Province.

Moved by Wm. Murray, seconded by D. R. Crocket.

* * *

Whereas, the importance of an abundant and cheap supply of Commercial Fertilizer is one of the most important factors in crop production, especially in Eastern Canada, and

Whereas the "dog fish fertilizer" produced at the dog fish reduction works operated by the Department of Marine and Fisheries of the Dominion Government, has proved a most valuable fertilizer and

Whereas the quantity of this dog fish fertilizer is not equal to the demand for it

Therefore Resolved that this Nova Scotia Farmers Association in Annual Convention do petition the Hon. the Minister of Marine and Fisheries to take strong measures to increase the production from the dog fish fertilizer factories.

Moved by Wallace Rhodinizer, seconded by W. H. Woodworth.

Whereas Farmers Cooperative Associations have been organized in Pictou, Antigonish, Inverness, Cape Breton and Halifax Counties and

Whereas a demand exists among several of these Associations for the organization of a Central Association to buy and sell for these Individual Associations,

Therefore Resolved, that this N. S. Farmers Association in Annual Convention do request the Provincial Government to enact Legislation whereby a Central Organization may be incorporated with which such Associations, subordinate thereto might affiliate to handle and conduct the common business of the Associations from a single centre.

Moved by H. S. Shaw, seconded by H. P. Blanchard.

* * *

Whereas. It has been and is the policy of both the Federal and Local Government to aid, both by public grants and otherwise, in the advancement of the agriculture interests throughout the Dominion and in the proper care and treatment of the land—the prosperity of which being at the base of all other solid and lasting prosperity, and

Whereas, It has for a long time been profoundly recognied that, at least, in the Province of Nova Scotia, the true fundamental need of all the clay up-lands is under drainage which renders them the most fertile and lasting productive of all, but without

Make Money this year from your "Sugar Bush"

Hundreds of farmers to-day make more profit from their "SUGAR BUSH," with less time and labor, than they do from any other crop on the farm.

The demand for Maple Syrup and Sugar is greater than the supply, therefore, prices are good and there is always a ready market.

If you have Maple Trees on your farm which you are not tapping, you are losing good money. Maple Trees always produce a fair crop. They need no care of any kind, yet, each year produce more, and are tapped at a season when you cannot do other kind of work.

WRITE TO-DAY, and let us tell you how to make the most out of your Maple Trees with the least time and effort.
Write NOW for FREE information.

Moncton Business College,
Moncton, N. B.
G. J. Schmidt, Principal

The Nova Scotia "Lumber King" says:

"I consider MINARD'S LINIMENT the best LINIMENT in use.

I got my foot badly jammed lately. I bathed it well with MINARD'S LINIMENT and it was as well as ever next day.

Yours very truly,
T. G. McMULLEN.

which, notwithstanding the most advanced culture, care and treatment otherwise, the labours of the farmer are largely unavailing and

Whereas, In view of the scarcity and cost of manual labor, the proper under-drainage of the individual farm is beyond the means and ability of the individual farmer by physical methods, although were mechanical methods available he would and could easily avail himself of them and

Whereas, Owing to the limited resources, the Provincial Government of Nova Scotia, has been unable thus far, to provide more than one ditching machine for the Province, and it is felt that in view of the great need, such provision is totally inadequate and that one such machine should be at the service of each County, and

Whereas, the recently promulgated and most wise policy of the Dominion Government is—outside of and beyond its own immediate agricultural aids and activities—to aid the provinces by additional grants and subventions.

Be it therefore Resolved, that the Dominion Government be respectfully memorialized by this resolution to give effect thereto and provide, as soon as may be, for each County in Nova Scotia, as a permanent asset of the Dominion, a ditching machine to be controlled and operated by its own officers and to be (upon payment of such reasonable charges as will compensate the interest on the cost, the expenses of operation and thecreation of a sinking fund for the eventual liquidation of the principal) at the servioe of the farmers of this Province.

Be it further Resolved, that copies of this resolution be forwarded to the Rt. Honorable, the Premier of the Dominion, and to the Honorable the Minister of Agriculture."

* * *

Whereas, all the Insurance Companies are advancing the rate of Insurance on Farm Buildings at the first of February to two per cent for three years, and

Whereas, Cooperative or Mutual Insurance Companies have been able to carry risks at about half that amount, and

Whereas, The County or Local Fire Insurance Companies are not large enough to assure the degree of security which might be desired

Therefore Resolved, that a Committee of three with power to add, be appointed from this Nova Scotia Farmers Association to get information and if deemed advisable to organize a Farmers Mutual Association.

Moved by C. H. Black, seconded by W. H. Woodworth.

The foregoing resolution was carried and Messrs. H. S. Kennedy, B. H. Lea and A. S. MacMillan were appointed to investigate and report at the next annual meeting.

* * *

Whereas, an agitation has been brought to bear on the Government of the Dominion of Canada, to permit the importation and manufacture of oleomargarine in Canada, as a substitute for butter, and

Whereas, after giving this matter consideration, we believe that this would be detrimental to the diary interests in Canada, and

Whereas, in the countries where oleomargarine is sold, it is not giving any real relief to the consumer, due to the fact that the price of oleomargarine is kept as near as possible to the price of butter, and

Whereas, we believe that the sale of oleomargarine would seriously affect the consumption of butter,

Be it resolved that we, the N. S. Farmers Association of Nova Scotia in annual Convention here assembled, place ourselves on record as being opposed to the lifting of the restrictions as they at present exist, and that a copy of this resolution be forwarded to the Minister of Trade and Commerce and also to the Minister of Agriculture at Ottawa.

Moved by F. W. Foster, seconded by P. C. Blanchard.

* * *

Whereas, the worrying and killing of sheep by dogs has caused a great decrease in the number of sheep maintained in the Province of Nova Scotia, and

Whereas, other Provinces of this Dominion have enacted laws which provide for the protection of sheep from depredation by dogs,

Therefore Resolved, that we, the farmers of Nova Scotia here assembled in Convention appoint a committee whose duty it shall be to go before the Legislature of this Province at its incoming session, and present the views of this Convention asking the Legislature to enact such regulation in this matter as we shall deem advisable.

Moved by C. P. Blanchard, seconded by A. Hector Cutten.

* * *

A resolution indorsing the aims and objects of the Good Roads Association and of the Union of the Municipalities in efforts for better roads was pasesd with a recommendation that the Provincial Parliament act on it.

A THREE DAYS APPLE PACKING SCHOOL WILL BE HELD AT FREDICTON, FEBRUARY 27, 28, AND MARCH 1ST, 1917

Instructors.—Mr. P. J. Carey, of Toronto, Packing Expert and Demonstrator of the staff of the Federal Fruit Division, will be in charge, assisted by officials of the Provincial Horticultural Division. It is also expected that Mr. George H. Vroom, Chief Fruit Inspector for Nova Scotia, and Mr. S. L. Peters, Fruit Inspector for New Brunswick will be present.

Object of The Course.—The object of this course is to furnish an opportunity for interested parties to learn the proper grading of apples, and the packing of them into both boxes and barrels, by doing the actual work themselves under competent instructors for as many hours as possible during the three days. Demonstrations of packing are practically useless, unless the students have practice in the actual work themselves long enough to learn, remember and be able to put into practical use later in their own orchards. Students enrolling for this course will be put to work at packing under the direction of the instructors, and should come prepared and determined to work hard and take home a good working knowledge of apple grading and packing that will enable them to pack their own fruit to much better advantage, and fit them for doing such work for others.

Men who know how to pack apples are needed in this province and the demand for such men is bound to increase.

Spraying.—Mr. George E. Sanders, Officer in charge of the Dominion Entomological Laboratory, Annapolis Royal, N. S., will give two lectures on spraying—the first on 'Insects of The Apple"—and the second on "Sprays and Spraying." These will probably be given early in the course, on the first day and the morning of the second day.

In addition to his entomological training and experience Mr. Sanders is a practical apple grower, and has for some years been conducting spraying experiments for the Dominion Entomological Branch in the Annapolis Valley. No man in the Maritime Provinces is better qualified to speak on this question of spraying. Mr. Sanders will have on exhibition specimens of injury to the apple by the various insects, also six cases of specimens of the eggs, larvae, pupae and adults of some of the most common orchard insects. He will also demonstrate the various spraying nozzles, the mixing of the new Bordeaux, and the effect of arsenate of lead and arsenate of lime on lime and sulphur. It is hoped to have on hand a small power spraying outfit suitable for New Brunswick orchards.

While Mr. Sanders will only give the two lectures and the demonstra-

tions, he will be present during the whole course, and thus available for individual consultation on spraying matters.

Hours of Instruction.—The course will open on the first day, Tuesday, February 27th, at 10 a. m., and on succeeding days at 9 a. m. Students so desiring will be able to continue the work in the evenings.

Equipment.—Excellent quarters have been secured in the Parliament Buildings in which to hold the course. The necessary supply of proper packing tables, presses, boxes, barrels, apples, etc., will be there. It is also expected to have on exhibition samples of American Boxed Apples and of New Brunswick, Nova Scotia, and Ontario barrel packs.

Free Railway Transportation.—Students coming by rail to attend this course should purchase ordinary return ticket, obtaining a voucher for the cost of the same from the ticket agent, and on presentation of that voucher the Department of Agriculture will refund the amount of the fare.

A Word About Attendance.—Every effort is being asserted to make this course of the utmost value to you. You need the knowledge in your orchard work and as long as you remain without it your orchard will not pay you as much profit as it should and can. Therefore, you should make some sacrifices to leave the work on your farm and attend this school, even to the extent of hiring someone to do your work while you are away. The knowledge you will gain will more than repay you for any such expense or sacrifice incurred.

You will get far more benefit from the course if you attend for the three full days, but if that is impossible, come for as long as you can and at least one full day.

Extension of Course.—If there is a demand by a sufficient number of those in attendance the course can be extended and the work continued on Friday, March 2nd.

Evening Sessions.—If a sufficient number of students desire one or more evening sessions I shall be glad to arrange for them. The Department has a large collection of lantern slides illustrating almost all phases of apple growing and could arrange for one or more illustrated lectures, or other desired addresses.

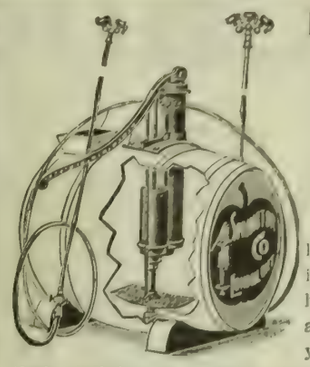
Importance of Sending Application.—It is essential that I should receive, at the earliest possible moment, applications from those intending to attend this course for all or part of the time, in order to provide ample table space, fruit and all necessary equipment.

Do not fail to send in your application at once.—I earnestly hope that a majority of the leading apple growers of the province will be present at this course, so that they may get together in a real live meeting at which they will determine, starting this year, to give their orchards that better care and greater share of attention which their producing possibilities merit. Until this is done we cannot hope for that development of the apple industry in New Brunswick which the favorable conditions of soil and climate rightly lead us to expect.

This is an opportunity for the live fruit growers of this province to obtain some much needed information, to get to know each other better, and to gather in convention with the express purpose of determination upon a definite course of action that will bring about, as speedily as possible, an improvement and development of apple growing in New Brunswick.

The day when isolated and independent effort is satisfactorily efficient is past-combined and concerted action is essential—Co-operation is now the Keynote—Let us strike it at this meeting.

A. G. TURNEY, Horticulturist.



Insure Your Crops with a Spramotor

It isn't a SPRAMOTOR unless we made it.

You find it good business to insure your life, your health, your home, then why not insure your crops upon which your livelihood depends. A few minutes' work with a Spramotor at suitable intervals will rid your crops of fungus diseases, and assure their arriving at maturity in that hard, healthful condition that secures first-grade prices. We have Spramotors adapted for every kind of spraying in every part of the world. Let us quote you prices and terms to meet your own special needs. Meanwhile write for a copy of our booklet which describes the various styles of spramotors and gives valuable information about the treatment of crop diseases.

DAIRYING.

SUCCESSFUL LaHAVE CREAMERY

When the Nova Scotia Farmers Association was in session at Bridgewater, N. S., during the closing days of January, 1914, many of the delegates availed themselves of the opportunity to visit the creamery then under the course of construction for the La Have Creamery Co. of Bridgewater. The LaHave Creamery Co. was organized in the fall of 1913. It is a strictly co-operative body capitalized at $10,000 and made up of 500 shares of $20.00 each. No one man or shareholder is allowed more than ten votes no matter how many shares he may hold, but one vote is allowed for every share held up to ten shares. The company is not allowed to pay over six per cent in dividends in any one year, so that the cream producers may receive the maximum amount for their cream.

The creamery opened for business on May 4th, 1914, Queens, Annapolis and Lunenburg farmers supplying cream. The first year's output amounted to 75,000 pounds butter and 1800 quarts ice cream. The year 1915 saw the output increased to 145,000 pounds butter and 8000 quarts ice cream. In 1916 the output increased to 214,000 pounds butter and 9000 quarts ice cream. The value of business done in 1914 was $25,000 and in 1916 $75,000. The patrons number 550.

J. D. McKENZIE,

Sec.-Treas. and Manager LaHave Creamery Co., Bridgewater, N. S.

The LaHave Creamery Co. also handle flour and feed for the patrons and shareholders at as near cost as it can be handled. Thirty carloads were handled in this way during 1916.

The farmers of Lunenburg and adjoining counties are a thrifty, industrious class. By patronizing the creamery they get the best market prices for their butter fat and have the privilege of buying supplies at lowest market figures. That they find the creamery a paying venture is evident by the way in which they are increasing its production.

The president of this enterprising creamery is Mr. C. R. DeLong of New Germany and the Sec.-Treas. and Manager is Mr. J. D. McKenzie.

Mr. McKenzie is a native of Ontario. Superintendent W. A. MacKay was instrumental in bringing him to Nova Scotia, and is to be congratulated on his good judgment in securing the services of such a practical and capable manager for The LaHave Creamery Co. Mr. MacKay has been so successful in the guidance of dairy industries and has been in so close touch with Canada's foremost buttermakers, that he can size up a man's calibre as creamery man at first glance. The creamery men of Nova Scotia are with Mr. McKay in any scheme he may undertake for the advancement of their industry. They all realize that Mr. MacKay does not advance unworkable theories and that before he advances an idea he has given it thoughtful consideration and viewed it from every angle. With a man of such calibre as superintendent of dairying in Nova Scotia and with such harmony and co-operation existing between him and the various creamery managers and patrons, is it any wonder that dairying is advancing by leaps and boounds in the Mayflower province.

The LaHave Creamery is proving a boon to the farmers of Lunenburg and adioining counties.

At the butter exhibition held in connection with the recent annual meeting of The Nova Scotia Dairymens Association, the highest scoring sample was the product of The LaHave Creamery, a 28 lb. box new made butter scoring 96.4. Their print butter scored 96.1 and their box of October butter scored 93.3, only .5 of one percent below the first prize winner of the class.

The butter buyers trophy for the highest scoring butter at the show was therefore captured by The LaHave Creamery Co., and to commemorate the event, Mr. McKenzie entertained the Association at a banquet on the closing evening of the association. Mr. McKenzie also took part in the butter scoring competition conducted by the Dairymen's Association and succeeded in tieing for first place.

Mr. McKenzie says the prize butter was made from their best cream, which they were particular to have of good flavor and properly ripened. We understand the cream grading system is followed with good success by The LaHave Creamery Co. It is prov-

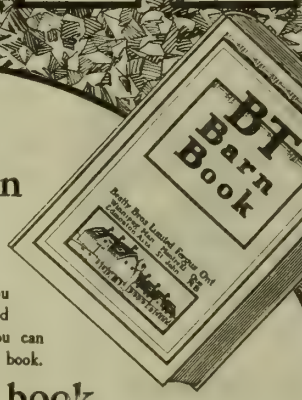
To every man who is building or remodelling his barn



THIS BT Barn Book shows you how to build your barn from start to finish; tells how to lay the cement floors, foundations, and how to build the walls. It shows you how you can frame your barn by a method that saves half the cost of the old way. You can build or remodel your barn yourself with this book.

This new 336-page book

It is the most elaborate book on Barn Building ever published. Contains many full page and double page pictures of the best Canadian Barns and many big blue prints that show clearly every detail of construction. Full of useful tables showing measurements for mangers, gutters, cattle-stands; costs of cement work; sizes for doors and windows. Capacities of silos and mows. Contains 14 working plans of model barns. Also shows BT Galvanized Steel Stalls, Horse Stable Fittings, Steel Hog Pens, Manure, Feed and Hay Carriers, and Water Bowls.

Mail Coupon

It cost us thousands of dollars to print this book. Yet, we offer it free to any man who will write and state if he is building or remodelling, when he expects to start the work and the number of head of stock he will keep.

Simply fill in the blanks of the coupon, and we will send the book by first mail.

ing a great impetus to the cream producers to receive a higher price for high grade quality. If any patron does not receive the highest price for his butter fat he realizes the fault is his own and it is to his own detriment if he does not rectify the conditions that tend to deteriorate the quality of his cream.

We wish to congratulate the patrons of LaHave Creamery for the progress they have made and for the success their product has achieved. Mr. McKenzie does not take all the credit to himself. He says that his success as a buttermaker at Bridgewater is due to the fact that he has been backed in the making of quality products by quality patrons.

A GOOD JERSEY RECORD AT EXPERIMENTAL FARM, OTTAWA

The Junior 2 year old Jersey heifer **Brampton Central Princess**—4723—developed and owned by the Experimental Farm, Ottawa, has just completed a year's test on record of performance establishing a new Canadian butter fat record for junior 2 year heifer of this breed. Freshening at 2 years and 137 days she produced in 365 days 9241.5 lbs. of milk testing 5.3% fat or 490.185 lbs. fat equivalent to 576.69 lbs. of butter, testing 85% fat. In this class she replaces her half sister Brampton Bright Kathleen which heifer, freshening at 2 years and 89 days, produced 9295 lbs. milk and 442 lbs. fat in 365 days.

Brampton Central Princess was bred by B. H. Bull & Sons, Brampton, Ont. Her sire is the famous bull Violas Bright Prince (Imp)—2803—the senior sire of the Brampton Jerseys, and which has a very large number of official record daughters of outstanding individual excellence in Canada, United States, Australia, New Zealand, and Jersey Islands.

The dam of Brampton Central Princess is Brampton Rosa Bonheur (Imp)—2519—owned by the Experimental Farm, Ottawa. This cow at 5 years produced 9250 lbs. milk testing 5.09% fat in 328 days and freshened in 335 days. She is by the noted sire Zara's Jap.—4121 P. S.

Brampton Central Princess consumed the following feeds during the 2 months before freshening and the 12 months on test.

3300 lbs. meal at $25.00 per ton	$41.25
2186 lbs. hay at $7.00 per ton..	7.65
11435 lbs. ensilage and roots $2.00 per ton.....	11.43
1350 lbs. Green feed $3.00 per ton	2.02
1 month pasture at $1.00 per ton	1.00
Total cost of feed.....	$63.35

The meal mixture was varied from time to time during test, but on an average was composed of:—

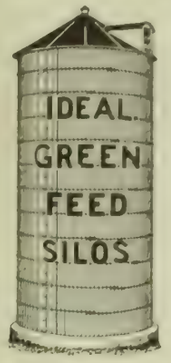
Bran	4 parts
Linseed oil meal.....	1 part
Dried Distiller's Grains....	1 part
Gluten Feed.....	2 parts
Ground Oats.....	1 part

Valuing her butter at 35c per lb. and skim milk at 20c per hundredweight, she made a profit of $156.00 over feed.

Valuing her milk at 8c per quart she made a profit of $232.37 over feed. it will be noted that the feed cost of milk was 68.5c per hundredweight and of butter 10.98c per lb.

Examine all young calves for deformities, and remove rudimentary teats from the heifers, dehorn all cross-bred stock—this should be done during the first week by clipping the hair from the horn bud, and applying caustic potash. In the case of male calves, see that their testicles are well developed. Never use a bull with one testicle, as such a fault is generally hereditary.

This is the time of year when an



Made in Canada

IDEAL GREEN FEED SILO

would pay big returns

Rich, juicy silage would give you 25% more milk and cut a big slice off your feed bill into the bargain.

Grain is expensive, and cows fed only on grain and hay will not begin to produce as much milk as cows on a silage ration.

A cow's milk yield falls off during the winter months simply because under the dry feeding system she does not get the stimulating green feed that she has during the summer. Silage supplies this green feed and reproduces, to a great extent, the conditions that make her give a big yield of milk in the summer months when she is out at pasture.

Silage is the cheapest feed and the greatest milk-producing feed known. While it is especially valuable in the cold winter months when dairy products are bringing their highest prices and cows ordinarily give less milk, it is hardly less valuable during the dry summer months when pasturage is scarce. Many cow-owners find that it pays to feed carried-over silage when pastures fail, because by so doing they prevent the falling off in the milk yield that is never fully restored, even with the return of good pasturage in the fall.

A good silo is the best investment you can make—an investment that will return you 100% every year you have it. No other equipment you could add to your farm will give you as great returns. Make up your mind now that you will not let another winter find you without an Ideal Green Feed Silo.

SHEEP CARCASS TEST OF THE SCORECARD

A wide thigh and a thick, full twist in a fat lamb are ordinarily associated with a high-cutting percent of leg. In like manner, a paunchy lamb is given credit for yielding a higher percent of plate than a thin-bodied one. Our score cards and judging standards have been built largely on a basis of proportion. Balance in the body has been the main thing upon which we have worked, and there has been little but the reasonableness of it to prove that the cutting yield of the carcass was influenced by the proportionate smallness or the proportionate size of the various parts of the lamb.

Eleven lambs were slaughtered at the Minnesota Experiment Station in an effort to get some check on the relation between our popular judging standards and the actual cutting percent. The conformation of the shorn lamb was recorded by measurements, lead forms, notes and pictures. These were duplicated in the carcass and the two lots compared with the cutting yield. Five of the lambs were rather common fine-wools, being narrow and deep-middled, with empty twists. The other six were medium-wool grades and crosses, and showed the breadth, fullness and blockiness which are associated with the mutton type. As might have been expected, the fine-wool lambs were rather thin, while those of the mutton type were fat.

Working on the basis of proportion, one would have expected the fine-wools to yield a greater percent of neck, fore-leg, shoulder and plate, and the medium-wools more rack, loin, leg and kidney fat. As it turned out, the fine-wools did cut out the most neck and fore-leg, and the medium-wools the most rack, loin and kidney fat. At the same time, the roomy, fine-wools yielded less plate than the medium-wools, and the full-twisted medium-wools less leg than the cat-hammed fine-wools.

The answer is, of course, condition. When an animal is thin a big proportion of the natural flesh which it carries is in the leg. As it fattens the plate, rack and loin thicken first and the leg last. Thus the fine-wools, though long-ribbed, cut 10.90 percent plate and flank, while the thick medium-wools, though trim, cut out 13.67 percent. In like manner the length and natural flesh in the legs of the fine-wools were enough to overcome their narrowness, and they yielded 32.94 percent of untrimmed leg to 28.81 percent for the well-made medium-wools. Taking out the bone and shank, the fine-wools still led with 31.58 percent leg to 27.59 percent for the medium-wools.

Throughout the test the proportionate width and length influenced the cutting yield, but influenced it only where condition was similar. Regardless of its effect on quality and dressing percent, covering in these tests proved to have the most important influence on the carcass yield from the cutting or butcher's standpoint. The average percentage yields of the wholesale cuts of lamb were as follows:

Cut	Average fine wool	Average medium wool
Neck	4.00	2.43
Plate and Flank..	10.90	13.67
Shoulder	20.28	20.08
Foreleg	4.54	3.52
Rack	13.38	13.89
Loin	10.40	12.52
Kidney Fat.....	3.56	5.08
Leg	32.94	28.81
Total	100.00	100.00

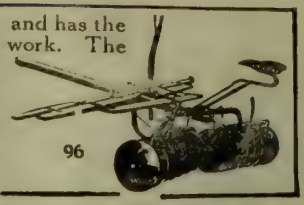
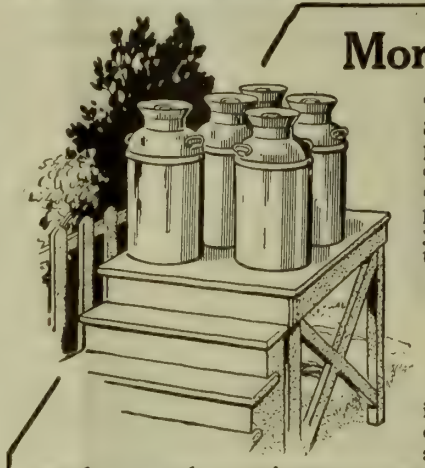
THE BACON HOG.—A GREAT OPPORTUNITY

From 1904 to 1914 Canada's export trade with Britain in hog products decreased and Denmark's increased. From 1914 Canada's export bacon trade has increased and Denmark's has gone the other way, showing a falling off of 73,000,000 pounds. For the fiscal year ending March 31, 1914, Canada's export of hog products totalled 23,620,861 pounds for 1915 the total was 72,036,025 pounds and for 1916, 144,150,309 pounds. The United States experienced a like increase. But so far as Canada is concerned, there is another side to the shield. On June 30, 1916, there were fewer hogs in this country than at any time during the previous ten years, and from 1911 to 1916 there was a decrease of one million. This serious state of affairs, as well as the opportunity that is before the country, is concisely and vividly pointed out in Phamplet No. 21 of the Live Stock Department at Ottawa, entitled "The Bacon Hog and the British Market" for which Messrs. John Bright, Live Stock Commissioner, and H. S. Arkell, Assistant Commissioner, are jointly responsible, and which can be had free on application to the Publications Branch, Department of Agriculture, Ottawa. Particularly unfortunate, says the pamphlet, is the decrease in the face of the rare opportunity that is offered us to further extend our "Wiltshire side" trade with the British market, a trade that for the year 1915 amounted in value to $15,957,652. In view of the facts here set forth it is hardly necessary to further refer to the gravity of the situation or to the opportunity that will be lost if our farmers and breeders do not bestir themselves. The joint authors point out that while we are not for specified reasons to occupy the market for fat hogs, that for the bacon hog is ours for the asking. They also call for regularity in the supply. "We cannot," they say, "go into the business for six months

The Bissell Disk takes hold of any soil, and has the "knack" of doing great work. The Disk Plates are of special design—they cut and turn the soil over. The draught is lighter, too, than any other Disk. In fact, you won't find another Harrow that can begin to compare with the record of the Bissell. Write Dept. M for free catalogue.



T. E. BISSELL COMPANY, LTD., ELORA, ONT.



More or Fuller Cans

Those who use Royal Purple Stock Specific secure from *3 to 5* pounds more milk from each cow per day. Figure the increase on even a small herd. It will pay you to feed Royal Purple to your cows, and steers can be fattened a month earlier by its use.

Royal Purple Stock Specific

is a digester, tonic, an animal conditioner. It aids digestion and assimilation and enables stock to get the maximum amount of good from the food eaten. Greater gains are secured from less grain, and the cost of the Royal Purple fed is very trifling. It will improve the condition of the worst, most run-down animal on your farm. If you have a poor, miserable, run-down, hide-bound horse in your possession, try it on him first and be convinced.

Royal Purple Stock Specific is put up in 50c. packages and $1.50 and $5.00 tins.

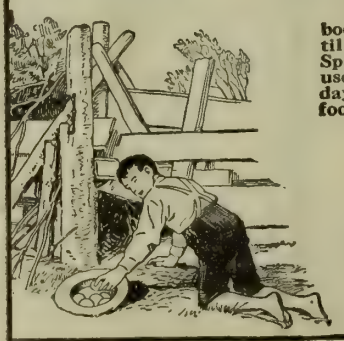
London, Canada

37

FREE BOOK

Write for FREE 80-page booklet on the common diseases of stock and poultry and our other products. It tells how to raise calves without milk, also how to build hen-houses.



Cases of Eggs Winter and Summer

Keep your fowl healthy, active and vigorous by feeding Royal Purple Poultry Specific in their mash, once daily, and you will certainly get eggs, winter and summer.

Mrs. W. Jackson, Saskatoon, writes:
"Gentlemen,—I tried feeding your Royal Purple Poultry Specific last winter. I had fresh eggs all the time. Sold eggs from January to the 1st of March, and I know it was the Specific did it, and the hens looked healthy after using it. I started feeding them again this fall, and got eggs in less than a week."

Royal Purple Poultry Specific

Manufactured from roots, herbs, minerals, etc., is a complete substitute for the grasses, seeds, herbs and insects the hen picks up during the summer, necessary in making hens lay. Royal Purple Poultry Specific tones up the whole system, keeps the stomach and bowels right—prevents diseases, such as Cholera, Roup, Rheumatism, Typhoid and kindred diseases.

Mr. J. Brandon, Ayr, writes as follows:
"Dear Sirs,—Kindly send me one of your booklets. We didn't have an egg all winter until we started using your Royal Purple Poultry Specific, and it is the best thing I have ever used. We are getting eleven to twelve eggs per day now on account of feeding them the right food."

Sold in 25 and 50c. packages and large $1.50 air-tight tins. Send for our FREE 80-page book on the common diseases of stock and poultry.

WAS TROUBLED WITH HER LIVER FOR FIVE YEARS.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick headaches, the sourness of the stomach, belching of wind, heartburn, water brash, biliousness, etc.

Keep your bowels regular by using Milburn's Laxa-Liver Pills. They will clear away all the effete matter which collects in the system and thus do away with constipation and all its allied troubles.

Mrs. John Fitzgerald, Brittania Bay, Ont., writes: "I have been troubled with my stomach and liver for the past five years, and have had constipation causing headache, backache and dizzy spells, and sometimes I would almost fall down. I tried all kinds of remedies without obtaining any relief.

I commenced using Milburn's Laxa-Liver Pills, and they have cured me. I have recommended them to many of my friends, and they are all very much pleased with the results they have obtained from their use."

Milburn's Laxa-Liver Pills, 25c. a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by THE T. MILBURN CO., LIMITED, Toronto, Ont.

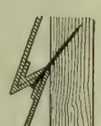
'Metallic' Clapboard Siding

YOU can quickly run up a neat, strong building—fire-proof and weather-proof—with Metallic Clap-board Siding. You save money,—wood sheeting is not needed, the Clap-board being nailed right on the studs. Outlasts the building it is put on.

"Metallic" Clapboard Siding

Made in heavily galvanized sheets 8 ft. long. Very easily handled. Far cheaper and more durable than wood. No knots or cracks and doesn't soak up paint.

Nailheads are sheltered from the weather (see small picture at right). Don't invite fire with wooden walls, etc. Use "M-R. Co." Clap-board Siding, "Eastlake" Galvanized Shingles, Ventilators, etc.



"Empire" Corrugated Iron, "Metallic" Ceilings, Pipe and Eave-Trough, "Metallic" Siding, Roof Lights, Vanes, Finials, etc.

Write us to-day for prices and illustrations. 176

Advertise in the Farmer

in the year and then go out of it for six months without having a general average of price that is unprofitable both to producer and packer." A good crop of hogs is required each month of the year. "If each farmer," the pamphlet says in conclusion, "maintains even one or, at most, two sows and manages these and their offsprings properly, there can be built up in Canada a very important and remunerative industry, not only yielding a permanent profit to the farmer, but as well materially assisting in preserving the commercial stability of the Dominion.

AYRSHIRES SELL WELL IN SCOTLAND

One of the most noted Ayrshire herds in Scotland is that of Mr. Thos. Barr, Hobsland, Moncton. In fact this herd is world famous, as many of the greatest Ayrshires of the United States, Canada, Japan and other countries have been selected from this herd. He now holds an Annual Sale of young bulls and cows. This was held on December 2nd inst., 1916, and eighteen bull calves realized $5135.00, an average of $285.00. The highest price, $1500, was paid for "HOBSLAND'S SCOTLAND'S BEST", a December .15 calf by "NETHERLAND SCOTLAND'S YET" out of "HOBSLAND'S JEAN" whose record in forty-eight weeks as a three year old, was 11,250 lbs. of milk testing 4.1%. Apparently there was keen competing for this bull. The dam of this youngster is a full sister of the renowned champion "HOBSLAND'S PERFECT PIECE", to which "SCOTLAND'S BEST" bears a strong resemblance. The next highest price was $430.00, paid for "HOBSLAND CORONET", a March calf of "HILLHOUSE MAJESTIC". The dam "HOBSLAND'S DOCKINS" has a record of 8,460 gallons of 3.81 milk, testing 3.81% in forty-three weeks. One of her daughters was sold at an auction sale in the United States for $2,000. The highest priced cow sold for $220.00.

There have been a number of sales of Ayrshires in Scotland of late at exceptionally good prices.

Huntingdon, Que., Dec. 27th, 1916.

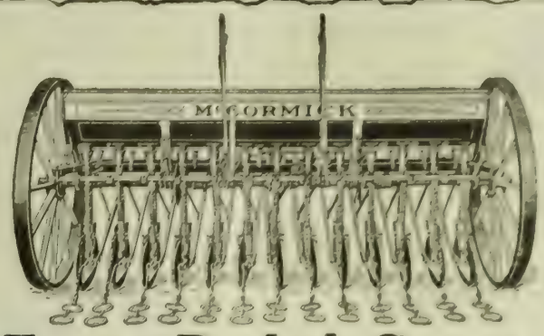
WORMS IN SHEEP

Sheepmen having flocks infested with stomach and tapeworms may free the animals of such pests by treatment before turning out to spring pasture. For this purpose a drench of copper sulphate has been found most satisfactory in the flocks at the Ohio experiment station.

Two fluid ounces of a solution made by dissolving an ounce of copper sulphate (blue vitrol) in two quarts of water is sufficient for a yearling, and a two-year-old sheep needs three fluid ounces. A long necked bottle or a rubber tube and funnel may be used to give the dose. Most effective results follow when the sheep are fasted for a day before and after treatment. Water should not be given for a few hours preceding and following the dose.

Digestive disturbances, poor appetites, loss of flesh and general weakness indicate the presence of worms. Lambs are most seriously affected, the experts say. Ridding the sheep of worms in the spring will result in fewer losses in the lamb crop.

Clover hay and silage provide a simple and cheap way of wintering cattle. If you are a little sceptical about corn growing, inquire into the merits of O. P. V. silage. You can grow O. P. V. to perfection.



Every Bushel Counts

WITH crop prices at top figures and likely to stay there, it is a very important matter to handle your seed sowing and crop growing so as to get every dollar of profit. Nowadays every bushel added to your harvest yield counts!

That is why so many careful farmers put the seed in the soil with **McCormick** drills. Why? They know that seed deposited at even depth means grain all up, growing and ripe at the same time, no half-ripe, half-green fields, no shriveled kernels in the grain.

McCormick drills have all the modern conveniences—braced angle steel frames; anti-friction, dirt and dust-proof disk bearings; accurate feeds; and any kind of furrow opener your land requires. Either plain or fertilizer types.

Your farm—no matter how "different" your soil or fields are—needs a McCormick drill. This is a good time to know more about them. Send for our drill catalogues and folders. They make profitable reading.

THE HORSE

LONGEVITY IN HARNESS GOT BY PROPER CARE

Good leather harness should last through a long term of years, if properly caeed for, excepting, of course, the little buckles and straps that will get broken and must be repaired. Harness that is never cleaned and oiled and must be exposed to the rains and snows while on the teams in necessary service, very soon begins to show the effects of service. The service in well-oiled harness is doubled and trebled by the timely application of these softening and preserving agents.

During the slack winter season there always come days very suitable for cleaning and oiling the harness. A rather warm room is the best for this work, preferably in the basement of the house or barn where a little oil, more or less, on the floor will not need to matter. The straps should first be unbuckled and everything taken off. This includes the quarter straps, lines, choke straps, belly bands —everything that buckles onto anything else and can be conveniently gotten loose. It is a good policy to hang all these straps of each set of harness to themselves so no mixup will occur in case six or eight sets are being washed and oiled at a time. This thorough disassembling of the parts insures an easier and more thorough job in the long run.

A tub of lukewarm water, preferably soft water, and a good stiff brush are the two main requirements in cleaning. Every strap should be gone over thoroughly and all the dirt removed. Then the leather is allowed to dry after the water has been all wiped off with a soft cloth or sponge. Some good harness oil is then generously applied and allowed to dry in pretty well, then another oiling is given, and the leather well flexed to insure its better penetration. This second oiling should do the job up about right. The parts may then be re-assembled and hung back in the harness room ready for service.

The collars and bridles should receive their cleansing and oiling along with the rest. Especially the collars should be gone over and cleansed thoroughly. The oiling of the harness helps to prevent, the gnawing of the leather by rats and mice, for these rodents do not seem to fancy the taste of well-oiled leather. They prefer the old salt-sweated article which has been weathered and uncared for. We often wonder if it is not the salt in the leather these animals are after rather than the leather itself. A cow will chew leather for this reason, if forced to go without salt for any length of time. The thorough cleansing in a tub of warm water removes this salt. The salty sweat is injurious to both the leather and the metal parts of the harness, if not removed at regular intervals. A thorough cleansing and oiling of the harness some two and three times a year pays a dividend in more ways than one.

THE STALLION LAW

A recent issue of The Breeders' Gazette says:—"Since the stallion law went into effect in Kansas in 1910 a marked improvement has been made in the quality of horses produced. The annual report of Dr. C. W. McCampbell, Kansas Agricultural College, Manhattan, as secretary of the registry board, shows that in 1909 2,000 grades and scrubs were advertised as purebreds, while not a single animal standing for public service was fraudulently advertised in 1916. Mare owners now have a means of knowing the exact breeding of the stallions patronized. Hundreds of stallions with fake pedigrees were sold as purebreds before 1910. That it does not pay to raise scrub horses is pointed out by Dr. McCampbell in this terse statement: "One can buy scrub stallions for less money than he can raise them and it is not necessary to wait 5 years either."

"Percheron stallions are gaining in popularity in Kansas, as shown by the report. Of all the pure-bred stallions licensed for 1916 65 percent were Percherons. During the year 2,658 purebred draft stallions and 502 purebred light stallions were licensed, as compared with 1,892 purebred draft stallions and 707 purebred light stallions in 1910. This is an increase of 40 percent in the number of draft stallions and a decrease of 30 percent in the number of light stallions. In 1910 3,766 grades and scrubs and 2,599 purebreds were licensed to stand for public service, while in 1916 licenses were issued for 2,130 grades and scrubs. This means that 21.5 per cent more purebreds and 43 percent fewer grades and scrubs were licensed in 1916 than in 1910."

Is it not time that the Maritime Provinces get down to brass tacks and do something drastic for the elimination from public service of grade and scrub and hereditarily unsound pure bred sires. "The greatest good to the greatest number" should be our motto in this respect. A few stallion owners may be somewhat disgruntled, but the results for good will be far reaching.

DOES OATS SUPPLY WHAT CORN CANNOT

A recent announcement from the Ohio Experiment Station, Wooster, does not conform with the opinion so generally held that oats as a feed furnishes more mettle to horsekind than corn. It is a popular notion that horses fed oats have more "life," keep in nicer condition and better endure work, specially in summer, than those receiving a grain ration largely or wholly of corn.

In an experiment which ran for 48 weeks, Prof. B. E. Carmichael submitted the popular notion to scientific test, using as his subjects 3 teams of mature geldings. One horse in each team was fed oats and the other re-

Dr. J. Woodbury's Horse Liniment

THE INFALLIBLE REMEDY

For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N, S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale. N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.

Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.

Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

BUTTER PARCHMENT
Printed or Plain, at the Maritime Farmer Office

POULTRY.

THE TRUTH

Editor The Maritime Farmer:—

Under the caption "Maritime Matters" and over the nom de plume "Maritime", a writer in a recent issue of Canada Poultry Review quotes a paragraph in your report of the Charlottetown exhibition in which you referred to the grants to said exhibition as follows:—"To accomplish this result a big sum of money was needed. The Dominion Department of Agriculture gave a grant of $2,500. The Government of Prince Edward Island gave a grant of $5,000, and the City of Charlottetown, as usual, set aside a grant of $500. This tidy aggregate of $8,000 enabled the management to offer a specially tempting prize-list. The response on the part of the Prince Edward Island agriculiurists and live stock breeders was most creditable in all departments."

Maritime goes on to say:—"Notwithstanding this 'tidy aggregate of $8,000,' the management of the exhibition could not or would not provide a judge for the poultry exhibit. The judging was done by an amateur poultry man from Nova Scotia who no doubt placed the awards to the best of his ability, but who has not had the experience in either breeding or judging to qualify for a position of this kind. What is the advantage of sending birds, or anything else to an exhibition if we are not to have the merits or demerits passed on by a competent judge. This style of judging does more harm than good, as it gives some exhibitors a chance to advertise birds as being prize winners at such shows, which could not possibly win under a competent judge.

"If the poultrymen would insist on poultry being given a square deal and getting a fair proportion of the grants, there would be no reason why a good judge could not be provided."

The foregoing tale of woe bears the earmarks of a disgruntled exhibitor. Evidently "Maritime's" birds did not win first prize at Charlottetown. To think that some other exhibitor could possibly show higher class birds than his would be absurd.

The writer of this letter attended the Charlottetown Exhibition on several occasions and one of the most lively discussions which I heard there a few years ago, was between two poultry exhibitors. It seems one of the exhibitors in question had succeeded in winning first prize on a White Leghorn hen several years in succession, until the poor hen got grey in the service. In the meantime some other young exhibitors were having an eye on the coveted prize and breeding their Leghorns accordingly. Well, the poor old hen was finally trimmed. The old hen could not stand the pressure and went down to defeat, and immediately the fat was in the fire and the beans were spiled. The owner of the ancient hen was wrathy and denounced the judge and the breeder who had the timerity to show a better bird than his, and by way of "diversion and to emphasize his feelings" he was ready and willing to show what he could do to his successful competitor, if given a chance. His main argument was a repitition of the remark "but I always used to win that prize."

There seems to be just as much common sense locked up in the tale of woe set forth by "Maritime." He was trimmed and fairly so, at the hands of one of the best poultry judges and breeders in the Maritime Provinces.

Tom Latham, the judge in question is no amateur. It is true he is not old and grey whiskered in the business, neither are his ideas. He is one

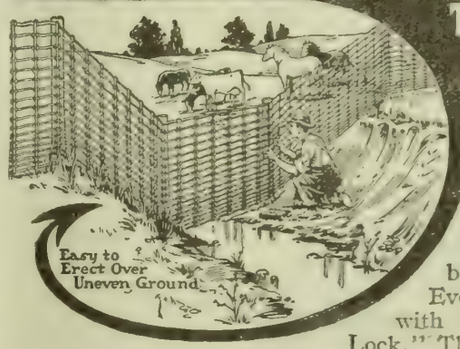
PEERLESS PERFECTION
THE FENCE THAT STAYS "PUT"



PEERLESS Perfection is one of the easiest fences to erect, because it stays "put." It can be erected over the most hilly and uneven ground, without buckling, snapping or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences.

Peerless Farm Fence

is made of the best Open Hearth steel fence wire. All the impurities of the steel are burned out and all the strength and toughness left in. Makes the fence elastic and springy. It will not snap or break under sudden shocks or quick atmospheric changes. Our method of galvanizing prevents rust and the coating will not flake, peel or chip off.

Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing.

Agents nearly everywhere. Agents wanted in unassigned territory.

HOW TO SAVE IN WAR TIME.

The Influence of Women.—As chiefs of the domestic "spending departments" women can exert an all-important influence. If they will once make up their minds to the uncomfortable necessity for spending less on our homes and our families, and our amusements and pleasures, the revolution in our national habits that is needed for the war will soon be carried out. They have done a great work for the nation in recruiting. They can do a still greater work for their country in saving. It is they who have to tell us how to save, to show us how to do it, and ultimately to carry out most of the saving that can be achieved in our homes, by cutting off the things that we can best, in their opinion, do without. With their sympathy and help, our great problem of financing the war is comparatively easy. Without them it can only be solved by methods which will lessen our staying power and leave us at the end of the war much poorer than we need have been.

Household Expenses.—No one should build a house for himself at this time. Moving (unless to a cheaper house) should be avoided; those who are obliged to move, or who are setting up house for the first time, should avoid neighborhoods where rents are high.

No furniture or other household requirements should be bought beyond what is absolutely necessary. The expenditure on pictures, pianos, ornaments, etc., should be severely curtailed.

The expenditure on flower gardens should be reduced, and as much of the garden as possible should be used for growing vegetables. Less should be spent on cut flowers.

The expenditure on coal, gas and electricity might be greatly reduced. Much less might be spent on fuel and light if we went to bed earlier.

Clothing.—There is, perhaps, more scope for the saving of money on dress by women than by men, and especially by women of the richer classes. Changes of fashion (one of the greatest causes of extravagant expenditure on dress) should be ignored, if they cannot be suppressed. Women should take a pride in making their dresses last as long as possible. All not strictly necessary extras, such as veils, white gloves, furs, silk garments, should not be bought. Women might make much of their own and their children's clothes and underclothing, and cut down old garments for their children as was the general custom of a generation ago. Time formerly spent on fancy needlework would be more profitably spent in this way.

Gifts.—The giving of presents on all sorts of trivial occasions should cease. Where presents are given—e. g., on the occasion of a marriage—they should not be costly and should be articles of real service.

Many persons would find it possible to save by spending less on their hobbies.

Eat Less Meat.—The price of milk would fall and our milk supply would no longer be threatened, if everyone were to **eat less meat** than they have been accustomed to, especially during the summer and autumn months. Most people would not suffer in the heast in health or strength by so doing, especially if they were to include in their diet a fair proportion of food which can supply the same kind of nourishment as meat.

Substitutes for Meat.—Cheese is one of the best and most useful substitutes for meat. Weight for weight, it contains more of this particular kind of nourishment than meat itself.

Milk and Skim Milk also contain this form of nourishment in a high degree.

Peas, Beans and Lentils also contain these properties, and after thorough cooking should be freely used where the amount of meat in the diet is reduced.

Economize Bread.—It is on bread that most of us rely for our main nourishment. Bread is the article which is most commonly wasted of all our food materials, and it is the one which the circumstances of this war require to be most carefully husbanded.

There are two ways in which bread can be economised without any real stint:

(1) By using every crust and crumb of it for food, and throwing none of it away.

(2) By only using bread which is at least twenty-four hours old.

Fresh bread is not so easily digested as bread which is a day old. The latter is more satisfying and less of it needs to be eaten. Our patriotic ancestors, in the wars of one hundred years ago, took advantage of this well-known fact, and were able to make a great saving in their store of wheat by giving up the use of fresh bread and eating only that which was at least twenty-four hours old. It was estimated that about one-sixth part of the supply was saved by this simple means. If this were done at the present day it might enable a ten-months' supply of wheat to last one year. This would be an enormous gain in our powers of resistance to the enemy.

BEVERAGES

COFFEE

"And while the bubbling and loud hissing urn
Throws up a steamy column, and the cups
That cheer but not inebriate, wait on each,
So let us welcome peaceful evening in."

Coffee contains some tannin, also contains a stimulating substance called caceine. Coffee is more stimulating to the nervous system than tea, but it should be used in moderation. Taken in moderation, without cream and sugar, coffee is a mild stimulant to gastric digestion, hence after-dinner coffee. Coffee also possesses a distinctly laxative effect.

The ground coffee is often adulterated with chicory, sawdust, and other substances. It is better to buy the beans and have them ground.

Test for adulteration in coffee,—Pour one cup of cold water on one tablespoon of coffee, if coffee floats and colors water slowly it is pure, if coffee sinks and stains water quickly, chicory or some other substance is present.

Coffee Receipe.

½ cup coffee, ½ cup cold water, several egg shells, 3 cups boiling water.

Mix coffee, half of cold water and egg shells together, add boiling water and boil five minutes. Pour out one cup of coffee to remove grounds from spout of coffee pot and then pour it back, add remaining cold water to settle coffee. Do not allow coffee to stand on grounds longer than ten minutes. Coffee may be reheated and used if it is drained from the grounds.

The vessel that serves as a coffee pot must be kept very clean. In cleaning a coffee pot only fresh water and a cloth kept specially for the purpose should be used. Never set the coffee pot aside with coffee in it. Occasionally boil out coffee pot with a solution of sal-soda.

TEA

"Tea! thou soft, thou sober sage; and venerable liquid; Thou female tongue-running, smile-smoothing, heart-opening, wink-tippling cordial."

A cup of ten infusion has little or no nutritive value, but it incites the brain to greater activity. The stimulating effect of tea on the nervous system is due to the essential oil and theine; the tannin produces astringency, this tannin is a bitter substance and is used commercially to tan leather. If tea is used in large quantities it tends to harden the lining of the stomach. Tea is for those who have passed the boundary line of youth, stimulants are not needed by the young and are positively harmful to them. However, properly prepared and used both tea and coffee on account of the sense of comfort and the mildly exhilarating influence which they impart, may be considered beneficial to the race.
